PREFACE

The Cambridge School of Pragmatism consisted of the founders of pragmatism, Charles S. Peirce and William James, along with Josiah Royce and the next generation of their pragmatic-minded doctoral students at Harvard University from the 1880s to 1910. The most prominent of these students, included in this four-volume set, were George Santayana, John Elof Boodin, and Clarence Irving Lewis. The members of the Cambridge School of Pragmatism all lived in Cambridge, Massachusetts, for a portion of their careers and had a relationship with Harvard University. Peirce, a graduate of Harvard, first formulated the principle of pragmatism during meetings of the Metaphysical Club in private homes around Cambridge during the early 1870s. Peirce later gave lectures in Cambridge elaborating upon his views, which he had come to label "pragmaticism." The foremost promoter of pragmatism to both the academic and public realms was Peirce's close friend William James, also a Harvard graduate and a member of the Metaphysical Club, who taught as a professor of psychology and philosophy at Harvard for many years.

These two giants of American philosophy, whose key writings on pragmatism are contained in the set's first two volumes, in turn deeply influenced several other prominent Cambridge philosophers who incorporated pragmatism into their systems of thought. The philosophies of Josiah Royce and John Elof Boodin, represented in the third volume, were the most important pragmatic varieties of American idealism during the first half of the twentieth century. The philosophies of George Santayana and C. I. Lewis, represented in the fourth volume, were the most significance varieties of pragmatic naturalism in American philosophy during that same era.

The Cambridge School of Pragmatism brings together in one collection the most significant and influential writings about pragmatism by these major American philosophers. Each volume also contains a select number of critical responses to their views, by other pragmatists as well as non-pragmatists. By bringing together this assembly of key writings, scholars and students will be able to focus on the pragmatic thought of each of these thinkers, and then also critically compare their positions to appreciate these convergent and divergent views on pragmatism. Together with the companion set, *The Chicago School of Pragmatism* (2000), scholars can access a complete collection of the central writings by the founders and early participants in the pragmatism movement in American philosophy from the 1870s to the 1930s. Spanning roughly fifty

years, the 108 pieces of *The Cambridge School of Pragmatism* are brought together from several dozens of now obscure and increasingly rare books, journals, and archival sources. Editorial modifications are limited to spelling, punctuation, and footnote corrections, to keep as close to the original as possible. This collection will be indispensable for the study of American intellectual history, and especially the evolution of American philosophy.

INTRODUCTION

Charles S. Peirce's turn toward pragmatism began as early as his first reading of Kant's *Critique of Pure Reason* in the mid to late 1850s. Some say that it began even earlier, when the young Charles was given a chemistry kit to play with and set out to initiate himself to the art of scientific observation and inference. Indeed, it was not long afterward, as rudiments of logic began to seep in his brain at age twelve, that he started to wonder about the art behind the art, the *ars artis* of the logic of reasoning and discovery.

A voracious reader, young Peirce had become well acquainted with the entire scope of the western history of philosophy by the time he reached his mid-twenties. He had studied the ancients, the scholastics, the moderns, and his own contemporaries, always with a burning desire to understand not so much their representations of man, nature, the universe, or the deity, as their theories of theory, their explanations of the activity of thinking, of conceptualizing, of finding truth, and of the fundamental nature of the reality that allowed such activity to take place. Peirce (1839–1914) was born and raised in Cambridge, Massachusetts, at a time when Harvard University was the center of the American intellectual universe, the dew point at once of the literary, the humanistic, and the scientific atmospheres. Peirce witnessed the fast-paced evolution of an academic institution attuned to the latest advances of thought. The optimism that prevailed in all departments of inquiry was infectious and contributed to Peirce's early conviction that devoting his life to studying the inner mechanisms of sound reasoning would help philosophers and scientists overcome the age-old anxiety of wondering, always, whether one could ever trust in reason's capacity to grasp a reality that always seems to elude just as new explanations get formulated.

As early as 1859 Peirce declared "that there was no need for transcendentalism."[1] This was in effect a refusal directed to all philosophers, not Kant merely, who, when confronted with antinomies that the premises of their system would leave unexplained, would ingeniously resort to the impatient strategy of framing an ad-hoc hypothesis that would seem to explain them away. Transcendentalism, with its desperate search for an intangible source of objective validation of our synthetic knowledge, was such an ad-hoc

[1] R921: 22–23, 21 May 1859. R followed by a number refers to a manuscript listed in Richard S. Robin, *Annotated Catalogue of the Papers of Charles S. Peirce* (Amherst: University of Massachusetts Press, 1967).

hypothesis, and so was dogmatism, with its exaggerated hope that knowledge could be securely deduced from a priori first principles. Ad-hoc hypotheses are elaborate ways of suggesting that there are levels of realities that are impervious to representation, and that in the end we need to recognize as either foundational or ultimate some version of the unknowable, sometimes made more attractive through clothing sufficiently opaque to hide the emptiness within. But Peirce rejected all forms of skepticism with their artificial distrust of our representational capacities since they are bound to beg their own questioning. The cognitive optimism of the time, the explanatory power of new scientific theories such as evolutionism, the formulation of far-reaching laws such as that of the conservation of energy, did not allow for speculative gloom. Peirce thus proposed his own alternative philosophical attitude, one that he, at first, and somewhat metaphorically, called "faith" in a treatise of metaphysics written around 1862. By faith he did not mean a religious but a metaphysical attitude that was neither overly critical nor overly dogmatic, but that sought to strike a balance by requiring that one accept without artificial justifications what common-sensical observation simply forces us to accept: faith is neither skeptical nor naïve or credulous; it rejects paper doubts as much as unmotivated or immediate beliefs – it is, as Peirce came to dub it more than forty years later, a critical common-sensism, an attitude that trusts our natural instinct to come up with answers that are more likely to strengthen our theories than weaken them, simply because the inferential powers we are endowed with, though fallible, have long survived the vicissitudes of time and life.

The moment one admits that everything is "of-thinkable," representable, or cognizable, the moment one is invited to reconsider the logic of thinking and to stop separating it too quickly from its object at either end: the source of predication and the fulfilled aim of its expression. As Peirce began to study afresh the logical conditions that govern the formation of any synthetic representation, of any ampliative judgment with a bold claim for truth, he dived at a depth that none of its worthiest predecessors, in their haste, had ever attempted to reach. Peirce got to the bottom of the ocean, saw that it was itself bottomless, and he turned that bottomlessness into a principle leading not to desperate metaphysical acts but to an actual understanding of the logic of belief – in other words, he saw that where others would likely despair over an infinite regress, he himself had hit upon a continuum that actually "made" sense because it was so constituted as to generate sense. Thus was born, in the mid to late 1860s, Peirce's new list of categories, a new account of how the old manifold of senses could be reinterpreted into a general conception whose very indetermination was an energetic call for determination, for representation, for the instauration of the "unity of consistency," that particular kind of unity that results from the dynamic and teleological union of signs.

From Peirce's early logical insight, pragmatism followed as a logical consequence, that is, as the logical unwrapping of much that was epistemologically and metaphysically entailed in Peirce's categorial analysis of the formation of judgments or inference in its broadest sense. The anti-Cartesian writings of 1868–69 consolidated the new platform Peirce proposed for philosophy, making it clear that there was no room within the representational continuum for the possibility of the unmediated knowledge of either oneself (introspection) or anything external (intuition), for logic showed that all knowledge was mediated by signs, so much so that attributing reality to the uncognizable amounted to a contradiction. As a matter of fact, reality itself, being essentially cognizable, and thus made of representable stuff, became defined, not as the object of individual inference for the latter is far too fallible, nor even as the object of social inference (for the same reason), but as the aim of the infinite inquiry of a limitless community of conversing interpreters. Reality, thus, as "would-be" result of an infinite supra-individual, supra-social, continuous process of information and reasoning, needed to be viewed both as that which resists the finite grasp of any thought – hence reality's independence – and as that which, through its own indetermination, determines and adjusts the direction of all truth-seeking inquiry – hence reality's dependence. Peirce's community (like Royce's much later) is not of this earth, but of all earths at once. Truth is the responsibility of every individual inquirer, not for that inquirer's sake, not for that inquirer's community's sake, but for reality's sake itself because, in the long run, there is no distinction to be made between reality's aim and mind's aim, and the aim of every individual is such as it is because it inherits its drive from that over-arching self-realizing purpose.

This volume begins with the first two texts of Peirce's "Illustrations of the Logic of Science" published in the *Popular Science Monthly* in 1878–79. "The Fixation of Belief" and "How to Make our Ideas Clear" (first published in French in 1877–78) present ideas Peirce had already written out much earlier between 1871 and 1873. It was in the fall of 1871 that Peirce founded the Metaphysical Club in Old Cambridge. Over the first two years of its existence (it lasted until the winter of 1874–75), meetings were held fortnightly and attracted such intellectuals as William James, Francis G. Peabody, Oliver Wendell Holmes, Joseph Bangs Warner, Nicholas St. John Green, John Fiske, Chauncey Wright, and Francis E. Abbot: a group of already or soon-to-be eminent philosophers, psychologists, historians, and law scholars. It was during these early meetings that Peirce introduced a new maxim of logic that he proposed to name "pragmatism," a word he would officially commit to paper only three decades or so later, however, after William James had popularized it. The maxim owed something to truth-disrobing lawyer Nicholas St. John Green, whom Peirce considered the grandfather of pragmatism because he would often remind the audience of the practical importance of Alexander Bain's definition of belief as "that upon which a man

is prepared to act" (see beginning of chapter 10). Peirce's logical research had made him more aware than anyone else of how much truth transited in the inner bowels of that definition – so much that pragmatism, would he say thirty-five years later, was "scarce more than a corollary" of it.

That "The Fixation of Belief" is a corollary of it is clear. The history of science is parallel to the history of the art of reasoning, and the latter is a reflection of the inferential habits of an individual or a community. An inferential habit is a well-established method of following particular trains of thought that render known the unknown by shedding over it the light cast by relied-upon information. There are many "guiding principles" that allow us to increase our body of knowledge, and obedience to such principles does not generally require that one be aware of them. In practice, one idea leads to another pretty easily, and the ease of it is often taken automatically as a sign of coherence and logicality that reinforces the credibility of our chain of thought. Rare are the practical situations that suddenly force us to search out not just for a solution, but for a method of finding a solution. Rare as they may be, though, sooner or later everyone of us is faced with circumstances that demand that we either retrace far more consciously a previous train of thought that led us to assert some terrible thought or commit some reprehensible act, or that we exercise our logical imagination to find out what the rules might be that govern an unfamiliar and inescapable situation. When ideas stop flowing easily from one another, or when they appear to have leaked into incompatible or hostile territory, then the time has come to unearth hidden habits of thought, or uncover new and better ones, so that errors may get corrected or avoided. Failure to conduct this logical examination – the formal analysis of the passing from one thought to another – may lead to the scourge of all philosophy: a poor and naïve metaphysics.

There are no purely gratuitous thoughts absolutely unconcerned with experience. Thinking is undetached action: it is as much an activity as is the motion of a hand hurling a hammer onto a nail's head. The fact that thinking is externally less noticeable and makes less noise is unimportant. Josiah Royce insisted vehemently on this: there is no appreciable distinction between intellect and will, for ideas are intentions intent on carrying themselves out. For Peirce, thinking is never disincarnated, even under the logician's scalpel, for a skeleton without ligaments is but a pile of crumbling bones. Asking a question or pronouncing a judgment are consequential affairs, and they are always motivated. Ignorance alone is not a sufficient incentive for questioning; ignorance resulting in frustration or suffering is far more likely to lead to study and inquiry. Knowledge alone is not a sufficient incentive for asserting some matter of fact; knowledge relevant to the handling of a particular situation is far more likely to get expressed and be shared with others with an insistence on its adequacy or trustworthiness. To doubt or to believe, these are two modes of experiencing thinking in our flesh – one is disquieting, the other

assuring. Inquiry is the process through which we pass from one state to the other. The psychological overtone should not mislead us; one should expect logical structures to translate into the sphere of lived experience. The passage from doubt to belief depends indeed on the passage from indeterminacy to determinacy, from manifold to unity, from substance to being: it is the very process of representation fleshed over in brain and blood.

"The Fixation of Belief" examines that passage and classifies the four main strategies that have proven particularly successful in human affairs – four methods of inquiry, or rather, four methods of ending an inquiry so that a conclusion be reached or upheld that allows us to conduct our affairs worriless. Belief does not require that one entertain a true opinion, but that one entertain an opinion as though it was true. The foremost desirable quality in a belief is that it be firm, not that it be true. Three of the four methods of settling opinions aim at strengthening them, at planting them in our minds so that they resist the gales of doubt-induced inquiry, while pretending to do so for the sake of truth.

Very admirable, widespread, and successful is the method of tenacity, whereby individuals cling to the first satisfactory idea that happens to float by, without considering other planks they could hold on to in the troubled sea. People of character, resolute decision-makers who cannot afford the luxury of rethinking, are justly praised for their cold-blooded gambling acts – until something goes wrong. Tenacity forgoes inquiry, not because tenacity is irrational, but because it is arational: it despises reason as a time-wasting obstacle to action, and it thus ends doubt by doubting the value of inquiry. Tenacious beliefs are signs that steadily avoid ampliative interpretants, and so, too, are authoritarian beliefs. Indeed, the second method, just as admirable although morally superior since it surpasses individual interest, is that of authority, or tenacity turned social. Authority gets rid of doubt by forbidding its practice and ruling or rooting out individual inquiry. Its aim is couched in commendable words: peace, security, stability, "law and order." It switches the responsibility of defining beliefs to the body politic or to the church, and demands allegiance by presenting itself as so trustworthy that independent examination becomes unworthy. The third admirable and even more respectable method is the a priori method, or authority turned dogmatic and intellectual. With it, inquiry is not dismissed, but accepted with the requisite that it be confined to speculative conversations within the confines of a bare cell. The conclusions of such increasingly amicable conversations take the form of fundamental propositions whose inner harmony and sense-making power instill in the dialoguers an irresistible inclination not only to believe them and in them, but also to turn them into *ur*-beliefs, self-evident foundations firm enough to erect sophisticated systems of thought, the more detached from experience, the less likely to disappoint. All three methods are effective ways of settling opinions, of limiting, reducing, or banishing the pain of

doubt, and of economizing research. Pragmatist thinkers cannot but appreciate their practicality, and so does Peirce, who is not naïve enough to discount them with a haughty shrug.

Yet, none of those methods has ever yielded long-lasting beliefs; firm beliefs yield strong believers, but oak trees are more easily uprooted than vacillating cattails. Unlike paper doubts, stone doubts don't burn; they resist rhetoric and sophistry because they are not themselves made of words. We stumble upon them, get hurt, and learn that sooth cannot be soothed away. Careful examination of both stone and wound becomes the only recourse and our only resource. Only the scientific method will not shrink from inquiry but revel in it and the demands of its logic. Only the fourth method will acknowledge reality's independence of our opinions and dependence on regular laws, and will grant a hearing to all earnest theories for the sake of finding truth regardless of the cost to personal pride. Only that fourth strategy will free the will from the bonds of arbitrariness by providing criteria distinguishing good from bad reasoning and restoring the wholesome possibility of believing with integrity. For truth alone, when acted on, "will carry us to the point we aim at and not astray," and only the scientific method nurtures enough patience and dispassion to secure those beliefs that are worth acting on because their consequences, far from undermining our humanity, will reaffirm its positive capacity to surmount ignorance and fear and take the risk of broadening knowledge and deepening the hope that accompanies it.

In "How to Make Our Ideas Clear," Peirce continues his logical inquiry into the possibility of genuine understanding. Neither Descartes nor Leibniz managed to provide clear and distinct ideas of either the clear or the distinct, hampered as both were by the method of apriority. Descartes's reliance on introspection as an evidential judge was honest but overconfident as to the actual clearness that could be obtained, while Leibniz's trust in the refinement of analytic definitions was blind to the fact that definitions don't expand knowledge no matter how their distinguos seem to increase distinctness. It is true, however, that, pace Descartes, the first grade of clearness is achieved by one's sheer familiarity with certain ideas, and that the second grade is achieved, pace Leibniz, by accumulating abstract definitions. But none of these two efforts are ampliative, none contributes to learning something new, and so none is concerned with reasoning since reasoning's aim is to make known the unknown. Modern science is ampliative through and through, and cannot be so without striving to make our ideas clear. But the desired clearness is of a different kind, one that at first blush is not a priori but a posteriori, and one that therefore must be of a far higher grade than the first two – if only because it is bound to be far more difficult to achieve, given that the stakes are much higher.

Generalizing the passing from doubt to belief to any process of ampliative inference beginning in the asking of a question (no matter how minute) and

ending in its resolution, Peirce insists that we cannot understand the process of thought without appreciating its fundamental mediatingness. Unlike sensations, which can only be immediately perceived from present moment to present moment, thought is the connective thread that runs through the succession of sensations so that their flow, or ordered transition from past to future, rises mediately to our awareness. Thought is a system of relationships that reveals the peculiar identity not of the sensations themselves but of their flow: it brings about the element of generality that governs or rules their succession. It does so, however, by virtue of its own distinguishing function or purpose, which is that of producing belief. Belief as the end-goal is what distinguishes thinking from any other type of activity. From this standpoint, belief needs to be redefined as "thought at rest," or the particular pause thinking achieves when the element of generality it was in pursuit of has been fully displayed so that there only remains to either contemplate it or obey it with calm and worriless confidence. Belief, therefore, is the instauration of a kind of awareness that replaces the agitation of inquiry with "the establishment in our nature of a rule of action," that is, with a habit.

With this idea, Peirce's pragmatism acquires its footing. The aim of all thinking is to bring the inquiring mind to a resting place where thinking stops so that rule-bound action can take flight. Inevitably, such a flight will generate situations that had been insufficiently thought out, the rules of action will show their limitations, doubt will return, thinking will restart, in an endless ballet. But no matter, the upshot of any thinking is the exercise of the will: some modification will take place in the world, an effect that is not mere thought will come into being and influence the future course of thinking, and thought will thus be truly tested. Production of habits of action is not an accidental but a necessary outcome of thinking: it is an integral part of its logical definition, not a psychological byproduct. This is why Peirce keeps insisting that pragmatism is a maxim of logic, and not an arbitrary body of metaphysical, least of all psychological, principles.[2]

If thought naturally produces habits of action, the latter provide an explanation of the meaning of conceptions. The meaning of a thought is the sphere of its practical influence. As a sphere, it has a general nature; as a source of influence or determination, it is conditional. Such is the nature of habits: they are principles of conduct and action "under such circumstances as might possibly occur," no matter how improbably. Possible circumstances need to be perceived, recognized, weighed, before the adequate habit of action be identified and then applied, since application is the purpose of any thought.

[2] Paul Forster published an important paper demonstrating this: "The Logic of Pragmatism: A Neglected Argument for Peirce's Pragmatic Maxim," *Transactions of the Charles S. Peirce Society* 39 (2003): 525–554.

Habits are anticipations of actual applications, and thus they are concerned with the "conceivably practical." Giving its due to this logical demand embedded in all conceptions then gives rise to Peirce's pragmatic maxim (not named as such in the text), which corresponds to the third grade of clearness. A clear conception of anything requires the expression of its conceivable practical effects – no matter how improbable the actual occurrence of such effects may be (as long as the effects themselves are probable or conceivable without contradiction).

As thought brought to rest, belief is intimately connected to the acquisition of a clear conception. Peirce suggests that for a belief to be true, it must be itself an effect brought about by a real thing. Since that real thing is the object of the belief, the belief must then have been generated by the object itself. But this cannot be ascertained within the belief itself as expressed, but by examining its own sphere of influence, once such a sphere is opened to general scientific investigation. Truth then will be the ultimate conclusion of that investigation, and that conclusion is reached when the investigation has exhausted the list of possible predicates. No individual researcher or finite group of researchers may reach that point, for reality cannot be confined to finite thought. But reality depends on thought in general, it fuels it, and effective partial representations in the short term are mere means toward the intended representational fulfillment. Our partial and fallible beliefs are beliefs to the extent that they partake of the final belief.

Why is "The Law of Mind" included in this collection of writings on pragmatism? The third of five essays published in *The Monist* in the early 1890s, "The Law of Mind" is an essential stepping stone in the development of Peirce's pragmatism, thirteen years or so after the two seminal essays just discussed, and thirteen years or so before "pragmaticism" burst onto the scene. Quite simply, "The Law of Mind" is to Peirce's pragmatism what "The Stream of Thought" is to James's, and we will see that, although it never discusses pragmatism, its main business is actually to make our ideas distinctly clear about the very core of the pragmatic maxim.

By the early 1890s, Peirce's philosophy has matured considerably, spurred by the development of his logic of relatives, the extension of his theory of categories from thought to nature through a careful examination of their interplay within phenomena of psychology, physiology, biology, and physics, the study of probability theory, and the incorporation of a full-blown, sophisticated, evolutionism into his metaphysics. Peirce is now ready to return to his theory of mind and to revisit the question of the concatenation of ideas, this time not merely from a logical standpoint, but, perhaps more demandingly, from a combined psychical and physical perspective informed by the latest mathematical advances.

Peirce's argumentative challenge is to showcase the advantages and demonstrate the necessity of a realistic over a nominalistic account of how ideas affect

one another. A little dose of phenomenological attention suffices to reveal that the highly convenient and useful preconception that ideas are (or can be treated like) discrete entities creates all sorts of explanatory difficulties that only ad-hoc hypotheses invoking occult powers of the soul can patch up. Reducing ideas to individual or separable entities precludes a satisfactory explanation not only of how they bridge from one to the next, but also how they maintain themselves through time. What prevents a once fleetingly conceived idea from vanishing altogether? Ideas hold on in the psychical space-time called consciousness owing to their being, not instantaneous flashes, but lasting events. They are episodes of immediate consciousness embracing infinitesimal intervals of time. Each of these intervals, by definition, is an immediately perceived sequence of three instants – beginning, middle, end – and each continuously merges into immediately subsequent and overlapping intervals: any beginning is the middle of the previous interval and the end of the penultimate one; any middle is the end of the previous interval and the beginning of the next one; any end is the middle of the following interval and the beginning of the subsequent one. Although each interval is immediately perceived, the relations of all parts across a sequence are mediately perceived or inferred. This mediate perception, in representing its object, is spread out objectively over the entire sequence, but subjectively embraced in the last interval or moment. The entire series gets therefore to be present in the awareness that accompanies the "last" moment, i.e., the moment that contains an end not already becoming but about to become the middle of the next interval. Past ideas can therefore be present because they are never wholly past: past and present belong to the same continuum of infinitesimal moments, and the nature of the continuum is such that a past in utter discontinuity with the present would be a contradiction. Ideas seemingly conceived in the present are continuously inherited from the past. This does not imply that the past is wholly in the present, for ideas tend to lose their intensity over time. To the extent that they are present, however, ideas are so partly "vicariously" or representationally, partly immediately.

Peirce's infinitesimalist account of the continuum of ideas is mathematically grounded. Well aware that infinitesimals were no longer in vogue in his time, he argues for their return first by appealing to Cantor's theory of infinite collections and insisting on the distinction between the two principal orders of infinite: the endless and the innumerable (a third kind, the endlessly infinite, is dismissed as pragmatically unmanageable), and second by offering a new conception of the continuum. Based on criticisms of both Cantor's and Kant's views, Peirce's new conception stems from the union of two properties: Kanticity on the one hand, or the infinite divisibility of the continuum (later rephrased in terms of having parts whose own parts are of the same kind, i.e., whose parts are never definite), and Aristotelicity on the other, or the stipulation that a continuum contains the endpoints of all of its endless series, and

thus contains all of its limits. The mathematics of infinites provides Peirce with a pragmatic justification of his recourse to infinitesimals: they improve conceivability, and especially that of a true continuum. The new definition of the continuum, in turn, allows Peirce to avoid all the traditional pitfalls pockmarked by the discreteness of ideas. Intervals of consciousness that mix both the past and the future become then conceivable ("the present is half past and half to come"), and immediate feelings need not be instantaneous: they are spread out.

The flow of time is not reversible, and neither is that of mind. The space-time of consciousness is a one-directional continuum of states or moments of feelings affecting or transitioning immediately into subsequent states or moments of feelings. Every moment is the overlapped patient of the previous moment and the overlapping agent of the next; no moment is ever isolated, and thus none escapes past contagion, wherever it comes from. Time's continuum allows Peirce to surmise that any feeling is part of the continuum of all those feelings that differ infinitesimally from it in intensity, and this accounts for the possibility of changing feelings. Space's continuum allows Peirce to surmise that parts of mind infinitesimally close to one another form a "community of feeling," an essential condition for the coordination both between and within minds. These hypotheses provide Peirce with much better equipment to approach the question of how ideas affect one another and give him the means to make a crucial pragmatic connection back to logic.

Ungeneralized ideas are feelings endowed both with a spreading or affecting energy that decreases as it gets more removed from the present, and with a tendency to carry along other feelings. Innumerable in any finite interval of time, they weld together into *general* ideas, these latter being continua of living feeling some part of which is immediately present. Within these continua, ideas gradually modify and shape themselves into others. The insistency of past ideas rises to infinity the less removed from the present they get. Conversely, one needs to conjecture that ideas not yet born are being *prepared* in the present through *habits*. Bonds between ideas, general connections, are getting established that call for the emergence of new ideas. Thus are future ideas "already affectible and already affected," and the closer they are to the present, the readier they are to emerge by virtue of that preparedness. It is this insight that allows Peirce to reopen the door to logic and to assert that affecting ideas cause the ideas they affect to be attached as "logical predicates" to them as "subjects." Thus each idea is made to *represent* the previous idea to the following idea and is spurred to do so by the flow of representational energy inherited from the past but always at its peak in the present understood as continuous mediation between past and future. Thus do suggestions from the past influence the future through the present: as an object influences an interpretant through a sign. There are three main forms to that influence, corresponding to the three classes of logical inference of deduction, induction,

and hypothesis, each one of which involves a habit by virtue of which future ideas will or would take place on a varying scale of certainty, according as these future ideas are themselves, respectively, reactions, general ideas, or associations.

General ideas imply the death of nominalism: they are living realities "concreted" by associations of feelings, and they pervade and govern mental phenomena. The law of mind is thus that ideas shall influence and be influenced by one another and determine acts in the future. Implied in this is a "developmental teleology" such as is exemplified in the phenomenon of personality.

In concluding "The Law of Mind" and its outline of "synechism," Peirce claims having successfully shown that all sorts of phenomena that used to call for ad-hoc hypotheses can now be demystified satisfactorily, and that a radical logical realism is the condition of that success together with what all that it entails: objective idealism (one that overcomes the traditional rivalry with empirical realism), tychism or the acknowledgment of the irreducible reality of chance (as principle of diversification and life), and evolutionism. Peirce's mature pragmatism will incorporate all of those results. Here, then, is why "The Law of Mind" is included in this volume, despite its being mute about pragmatism. In stating that mind's law is that "ideas tend to spread continuously and to affect certain others" that happen to be affectible, and that in doing so such ideas gain generality and weld with other ideas, Peirce has managed to clarify one central aspect of his pragmatic maxim: how a conception may have effects. The answer is that they do so because they affect other conceptions in a variety of ways, some of which are indeed "reactions," and that such affections need not be postulated with an air of mystery, explainable as they are through a proper mathematical and pertinently metaphysical and logical understanding of both continuity and generality.

After William James, in 1898, publicly acknowledged Peirce as the founder and coiner of pragmatism, Peirce became more concerned about the welfare of the maxim he had fathered twenty-five years earlier. Childless Peirce was not going to abandon his intellectual progeny to the fate of loveless kidnappers. The first printed occurrence of the word "pragmatism" in Peirce's writings appeared on April 20, 1900 in his praise of Clark University on the occasion of its decennial celebration: "in my youth, I wrote some articles to uphold a doctrine I called Pragmatism, namely, that the meaning and essence of every conception lies in the application that is to be made of it.... But the question arises, *what is* the ultimate application; at that time, I seem to have been inclined to subordinate the *conception* to the *act*, knowing to doing. Subsequent experience of life has taught me that the only thing that is really desirable without a reason for being so, is to render ideas and things reasonable.... Logical analysis shows that reasonableness consists in association, assimilation, generalization, the bringing of items together into an

organic whole.... In the emotional sphere, this tendency towards union appears as Love; so that the Law of Love and the Law of Reason are quite at one" (*Science*, n.s., vol. 11, no. 277: 621). The fact that the correction Peirce is here initiating coincides with his first published used of the word "pragmatism" is significant. That correction clearly benefited both from Peirce's personal struggles that began after he resigned from the Coast and Geodetic Survey and from the synechistic turn he took in "The Law of Mind" and sharpened in his Cambridge Conferences Lectures of 1898. Peirce's supplement to the pragmatic maxim would have made Josiah Royce proud, for now Peirce wonders about the ultimate, not merely proximate, application of conceptions, feeling that not taking that question seriously would greatly endanger pragmatism by reducing it to a doctrine that could too easily satisfy nominalistic propensities. Reasonableness itself is proposed as the ultimate practical purpose, a purpose distinguished from any other in that it has no other end than itself. Reasonableness is the ultimate tendency that governs all representational yearnings: the goal is to unify for the sake of unification itself, for what this will produce will coincide with the original object, the source that fuels all representational processes.

The second opportunity to put "pragmatism" into writing arose a few months later, in October 1900, when James Mark Baldwin asked Peirce to provide his own definition of pragmatism for the *Dictionary of Philosophy and Psychology* (it appeared in the second volume in 1902). William James had been solicited as well, and Baldwin coordinated their contributions to the entry, found in the fourth selection in the present volume. Peirce took advantage of this opportunity to clarify two things along the lines of his *Science* article: first, that the spirit of the logical maxim of 1878 was not so much to require that the proof be in the pudding, although that is already of great utility, as to identify the end that the pudding is intended to fulfill: the true interpreter of our thought, or upshot of our conception, is not some practical fact, but the general idea that presides over it. But even this is not quite sufficient: in the second place, we need to acknowledge that beyond the third grade, there is yet a higher, fourth grade, of clearness, whose maxim is that one should consider how the conceivable practical effects contribute to the development of "concrete reasonableness," that is, how effectively they participate in the realization of the higher order from which they derive their meaningfulness. The higher order, however, is not cast in marble, for it "lies in the evolutionary process" itself: reasonableness grows in step with the continuum of generalization and habituation whose process Peirce's synechistic pragmatism describes.

On 26 March 1903, Peirce delivered the first of seven lectures on pragmatism at Harvard, a series made possible thanks to the efforts of William James. For the first time Peirce is given the opportunity to take a public stance and explain his exact position. Pragmatism is no longer a just-

born philosophy but a fast-moving toddler prone to temper tantrums. Many are the thinkers seduced by the youngster's ravishing smile and all want to grab and cuddle it in their arms. Peirce is well aware of the ebullient competition, and aware, too, that no one is paying any attention to him, the founder. This is now his chance, and he is determined not to waste it. He is rightly afraid that none of the kidnappers around him has learned how to care for the child he fathered, principally because none knows the recipe of the only formula that will keep it well fed: logic. It therefore behooves him to describe the formula's ingredients and to teach how to mix them. The task is dull and requires patience, but only those willing to learn it will be fit for childcare. The first lesson is to stop believing that pragmatism is a magical formula similar to the first principles of seminary philosophy: it is merely a maxim of logic, and thus an instrument of right thinking, or, perhaps a little less modestly, a "philosophical theorem," thus not a postulate nor an axiom or self-evident truth, but a general enunciation[3] that lends itself to a diagrammatic demonstration, and thus a proof. This theorem states that the meaning of any synthetic judgment expressed in the indicative lies "in its tendency to enforce a corresponding practical maxim expressible as a conditional sentence having its apodosis in the imperative mood." By recasting the maxim in such a fashion, Peirce emphasizes both its logicality and its metaphysical purport (or the fact of its wide range of application). Buried in it is a principle of pragmatic faith: any fact-related theory can be tested by converting it into a practical precept stating the conditions under which definite action ought to be undertaken because the range of its consequences has been anticipated in the very expression of the theory. The indicative mood of the judgment anchors its purport not merely in what has been actually observed at particular instants, but in the incoming experience extending toward the long run: a statement of fact is one that carries the assurance that future experience will be consistent in its regard, and that the pursuit of our activity shall bear it out. Claiming that a synthetic proposition is true, therefore, amounts to turning it into a maxim of conduct.

Peirce has no doubt about the usefulness of his theorem. Its application provides a method of inquiry that is aimed at the highest level of clearness, and it helps solve all sorts of problems, including intricate ones connected with probabilities. If one wonders what it means for an event to have a certain probability value p, the method requires that one examine the practical difference such a value makes when compared to other values, and one of that method's outcomes is to sharpen our understanding by both broadening

[3] From "New Elements" (1904) in *The Essential Peirce: Selected Philosophical Writings, Volume 2 (1893–1913)*, ed. Peirce Edition Project (Bloomington: Indiana University Press, 1998), p. 303.

and deepening our grasp of the concept: for instance, $p = 1$ does not mean that a particular event will certainly occur, but merely that the ratio p of the species of events referred to, to that of their genus, is 1. The significance of this is especially manifest when our method brings us to consider a case in which the genus is infinite, for in such a case it becomes clear that such a ratio does not allow us to conclude anything about the certainty of particular occurrences. The method thus serves to clarify the conception and saves us from attaching too precipitously to it a meaning that misses the mark.

Such usefulness is no guarantee that the pragmatic theorem is actually true: it does not constitute a proper demonstration of it. Peirce is careful to emphasize the need for being scrupulous about it: there are very legitimate reasons to think that the maxim as a rational rule may in fact be inadequate. We may wonder for instance whether the concept of incommensurability has any meaning worth its pragmatic salt since the difference between commensurable and incommensurable is admittedly one that is practically and objectively not consequential. When a difference between conceptions depends merely upon the limits of conventional systems of expression, one cannot earnestly hold it to be practical, for otherwise pragmatism would be "completely volatilized." And yet, if the maxim implies a strong rather than a weak conception of practicality, it would seem that certain distinctions with solid historical pedigree would nevertheless need to be discarded on pragmatic grounds, and this suggests that the maxim may either be wrong or too harsh. Pragmatism thus cannot be taken for granted, and inquiry into its most fundamental assumptions is needed. This is what Peirce sets out to do in the ensuing Harvard lectures, where he has his listeners follow an itinerary leading, through an examination of the three phenomenological categories and the three normative sciences, to an extended scholastic realism essential to a proper understanding of pragmatism's metaphysical reach, or its "instinctive attraction for living facts."[4]

Since there is no room in this volume to include all seven lectures (they have been published in full elsewhere), only the first and the last that frame the series have been selected. By the time Peirce reaches the end of his lectures, he has made it clear that what matters most for pragmatism is what he had been pursuing all his life: to give a proper account of the necessary relation between general and singular. Failing to provide such an account would signal the death of the pragmatic method and its guiding maxim, and imperil logical realism. Such an account must start where the entire philosophical tradition has always started out of good instinct: with perception. Understanding the genealogy of all our conceptions is needed, and there is no

[4] From the second Harvard lecture of 1903 in *The Essential Peirce*, vol. 2, p. 158.

reason not to trust the inferential fact that all conceptions can be traced back to perceptual judgments. This is Peirce's first of three "cotary propositions," or propositions whose acceptance will sharpen the maxim's cutting edge by providing it with solid phaneroscopic grounding. All our ideas are at bottom perceptual because the first premises of all thinking even of the most abstract and critical kind first emerge from uncontrolled perceptual suggestions. The pragmatic maxim itself shares such a genealogy, and the crux of Peirce's argument is to show that the maxim needs to display itself the logic of that genealogy.

Every perceptual judgment fulfills two functions at once. On the one hand it provides testimony about the world of singular percepts, and on the other it does so by expressing these percepts in propositional form. As to the first function, perceptual judgments result from actual reactions of sensed singulars upon the mind; they testify that actual sensory solicitation is taking place and that it emanates from something that can be pointed at via an indexical sign. Perceptual judgments get formed in reaction to these singular solicitations, and such judgment formation takes the form of interpretation. The subject of every perceptual judgment is thus a singular, which, as such, is unique to every perceptual judgment. Each singular percept of a same object over time is part of a collective singular, whether that object be that of some concrete individual or that of a general conception like *dog*, for the latter arises from the experience of the singular collection of all dogs, and Peirce maintains that a class is an individual. Thus every perceptual judgment provides testimony about a singular, and such a singular, or percept, is the element that is acting upon the mind so that the latter reacts by forming a perceptual judgment. In categorial terms, every percept is a second, and as such includes a first, the form that it carries in order to attract attention. The solicited mind perceives that form and can only acknowledge it by providing to itself a representation of that form. This is the second function of perceptual judgments: they represent the form (the logic of which representation and interpretation is what Peirce's foundational text "On a New List of Categories" is all about), and they do so by recognizing its relational character and turning it into a relational predicate or "rhema." Rhemata are predicates ready to be attached to a subject; as relations they are general, and the origin of that generality is nothing mysterious: it is merely the mark of their representational or logical nature, a mark obtained through a process of generalization that is the hallmark of two kinds of ampliative inferences: abduction (especially, because it takes place at a first-intentional level) and induction (to a lesser degree, because it takes place at a second-intentional level).

This leads us to Peirce's second "cotary proposition": perceptual judgments contain general elements. This entails two consequences: one, that universal propositions are deducible from these general elements, and two, that thirdness is directly perceived. The first consequence is significant, because no

perceptual judgment can be a universal proposition since it is the cognitive product of singular reactions, and one needs to be able to account for the possibility of universals. One must see, however, that the general relational elements included in all perceptual judgments have mathematical properties that transcend them – for instance, the relation of subsequence is transitive – and therefore universal propositions regarding such properties can be deduced from them. As to the second consequence, one way of putting it is that inference itself is ultimately given in perception. This is the case not only of its matter (the conceptions processed through inference), but also of its form, whether that of deductive necessity, inductive probability, or abductive expectability. We cannot ascribe these forms to the only property of reasoning not found in the formation of perceptual judgments, namely self-control, because self-control originates nothing: it is merely inhibitory. Therefore these forms emerge directly within our perception of the inference before it has been validated, and this means that inferentiality is perceptual; it is directly suggested. In addition, perceptual judgments are predications of relations, and as the result of interpretations they are themselves propositions that are conclusions of arguments (not deductive, but abductive). Peirce shows that conclusions are the "intended interpretants" or meanings of an argument, and that they are intended by the very gathering or copulation of the premises. The purpose embedded in every argument is to determine the acceptance of the conclusion. Both the rhemata and the premises that embed them contribute to the formation of such conclusions, so that they both carry out the inferential intention as well. Thus every element of a perceptual judgment is purposive, and purpose is categorially a third. If that is the case, then Peirce may claim that "thirdness pours in upon us through every avenue of sense," for the very reason he had begun stating eleven years earlier in "The Law of Mind," that continuity itself is given in perception.

At the core of the perceptual process is abduction, or the operation of forming an explanatory hypothesis. The explanation that is required seeks to make sense of what kind of solicitation a mind is subjected to when it reacts to singulars. Forms need to be recognized, identified, and ascribed so that the "strange intruder" become familiar. Singulars intrude as surprising facts, and abduction's goal is to remove the element of surprise by replacing it with a "habit of positive expectation" that can be trusted. This it does by suggesting "something that may be the case," on the basis perhaps of prior similar experiences that lead to the tentative proposition that some ingredient in the current experience could belong to the same class of ingredients previously encountered, and that, if so, this might actually explain some relevant portion of it. Peirce contends that this abductive process is, formally, exactly what takes place in the formation of a perceptual judgment, the only difference between the regular forming of a hypothesis and that of a perceptual judgment being experiential: where regular abductions are felt to be approximative,

conjectural, and deniable, perceptual ones occur without any critical input or control. They are forced upon us, and we cannot but accept them. But otherwise, there are no formal differences between the two. This is Peirce's "third cotary proposition." Our abductive faculty is merely a magnification of our perceptual faculty, or the generalization of its practice into the less perceptual and thus more shaky realm of our reason.

The logic of abduction is not only at the core of pragmatism, it is the whole of it. There is a powerful reason for it: the maxim spells out precisely what is needed in order to evaluate any hypothesis, no more no less. Any abduced hypothesis, to the extent that it has been abduced and not merely thrown in arbitrarily, thus to the extent that it is an experiential theory, must be verifiable by an experimental inquiry that first deduces from the theory what sorts of facts it predicts, and then conducts series of successive experiments in order to observe and induce to what degree actual phenomena develop that agree with the predictions. Observed agreements provide an approximative idea of how the theory generally tends to agree with the facts. To be admissible, a theory is one whose repeated experimentation will produce in the long run results sharing a certain general predicate, a predicate that, as it emerges from the observation of a sufficient set of successive tests, will become identified as a real regularity that spells out the law of the phenomena's continued succession. A regularity of such a kind, because it expresses a necessary relation between general and singular, expresses what can be anticipated to occur again and legitimizes the kind of positive expectation "that shall not be disappointed." The validity of induction depends upon the assurance that disappointment shall not take place, and upon this assurance pragmatism rests.

The fact that our abductions get inductively verified more often than what the law of probabilities would lead one to expect is for Peirce a result of evolution. We are relatively good at "divining the ways of nature" because our mind, over eons, has developed a familiarity with the thirdnesses of nature, and we may call that familiarity "insight." An insight is a perception of a thirdness that escapes reason's oversight. Peirce says that its nature is that of instinct, and that the latter is the veritable ground of our sense of reasonableness. Instinctive knowledge and perceptual judgments belong to the same class of operations, and they are part of a vast complexus to which logic is to be true and of which the part of mind subject to self-control is "mere blossom." If all our conceptions are at bottom perceptual, it is because their generalization can be traced back to others that were once born in that vast complexus. But conceptions, we have seen, are also purposive since they contribute to the inferential process, and their general purposiveness is that which provides direction to the expression of these conceptions into their practical consequences. Conceptions differ from one another only to the extent that they introduce differences of conduct, and such an introduction,

or expression of practical consequences, is properly called action. The conformity of action to intentions is directly given in perception, just as are the elements of the action itself. This allows Peirce to reformulate the pragmatic logic of abduction in his famous terms: "The elements of every concept enter into logical thought at the gate of perception and make their exit at the gate of purposive action; and whatever cannot show its passports at both those two gates is to be arrested as unauthorized by reason." Thus, for Peirce, "logical energy" emerges abductively from perception into the field of controlled representation, and once it has given rise to conduct-modifying action, that energy is spent and "returns to the uncontrolled and uncriticizable parts of the mind."

Many of the key ideas expounded above are echoed in the seventh chapter, "What Pragmatism Is," written over the summer of 1904, which Peirce opens with a reminder that pragmatism was born in the laboratory, never to take off its white coat. He was painfully aware that the kidnappers of his child had meanwhile become more brazen and had begun to bandy it in literary journals. Though Peirce could still accept or suffer the manner in which a James or a Schiller were promoting pragmatism, he fully understood that a logical conception had no chance of survival the moment it had caught the fancy of inexact writers. He therefore took the only course that could secure safe passage to his maxim through the pirate-infested waters ahead, and that was by changing its name to something ugly enough: pragmaticism. With pragmaticism, Peirce was not merely adding a new -ism to an ever growing collection of philosophical trends that included radical empiricism and humanism. On the contrary, he was removing his original -ism once and for all from that collection, and turning it into an -icism that would, as it were, become the fountainhead of all pragmatisms however conceived. Indeed, Peirce's formulation of his pragmatic maxim was so solidly rooted in the logical analysis of representation in its most general form that it was practically inconceivable that any other form of pragmatism could not be deduced from it with their particular errors, or departures from its logic, brought to light.

Capital to Peirce was the particular advantage that the formula of his pragmaticism was subject to a critical proof. His maxim is not a postulate nor an axiom, but a theorem that, when dressed in a white coat, states that the complete definition of any conception consists in the accurate account of all the conceivable experimental phenomena implied by either its affirmation or its denial. Though such a theorem may seem to announce an extended form of positivism, it is one that rejects all traditional metaphysical gibberish, retains and builds upon all of those beliefs that we have no reason to doubt (especially those of instinctive origin), and carries high the flag of scholastic realism for the reasons stated earlier. Peirce is careful to explain that the meaning of a conception never consists in the results of isolated laboratory

experiments, but in experimental phenomena of a general kind, that is, in regular sequences of events that have become predictable and whose occurrence is sure to take place once certain described conditions are fulfilled. The meaning of a conception takes thus the form of a general conditional proposition that is found to be really operative in nature or in human affairs. Such generals are real, and what they express is a future commitment. Indeed, because the meaning of any proposition lies in a future proposition, the latter must have a form that allows it to be applicable to human conduct and its power of self-control, no matter the situation or the purpose. That form must therefore be one that describes all the conceivable experimental results that may follow a particular course of action implied in the assertion of the initial proposition, for it is the taking into account of such results that is alone likely to modify or affect human conduct. Pragmaticism, from this standpoint, is no mere phenomenalism. As a logical method, it is not interested in observing or describing particular phenomena; it specializes instead in the identification of the "rational purport" or the "purposive bearing" of conceptions.

This focus on the rational purport might give pragmaticism an obsolete air of naïve idealism, but Peirce shows that only a nominalistic mind would be prone to such a misconception. If such a misfit would only apply the pragmatic maxim to the conception of the reality of a general, he would come to see that inquiring thought, general as it is through and through, when controlled by a rational experimental logic, tends to express certain conclusions whose truth does not depend upon any particular individual or collective act of thinking or conducting the inquiry. Inquiry does tend to fix opinions that, in the long run, will resist challenges and counter-experiments, and such opinions will appear to be "destined" in the sense that it was their destiny to emerge, simply because what they represent is real. Now, those ultimate opinions are general, and they are real – and they even may be physically efficient, to the extent that they will suggest and regulate individual courses of action within the set of circumstances or conditions they specify. The rational purport of any concept is such a real general, a general conditional proposition aiming at the future and really influencing human conduct. For pragmaticism, therefore, what comes to matter most is the process of evolution whereby the existent comes more and more to embody the "destined" generals, and the only method that offers any guarantee as far as discovering what those destined generals may be is the scientific method under the guidance of the pragmatic logic of abduction.

There is only a small step from holding that generality is real to holding that continuity is an indispensable element of reality and the essence of thought, representation, mediation, genuine thirdness. The categorial theory, by showing that secondness is prescindible from thirdness, and firstness from secondness, implies that nothing gets actualized through action if it is not a

concretion of some general, that is, if it is not the application of some habit or purposive idea, while action is the realization of certain formal possibilities whose apprehension, selection, and carrying out enables it to fulfill its purpose. Pragmaticism implies a tricategorial or trimodal realism, and thus a rejection of nominalistic individualism of all stripes. Such an implication and rejection has an important methodological consequence as far as defining the pragmaticist's general philosophical attitude is concerned. How does one do philosophy, how does one go about thinking about all the vexed issues of a multi-secular tradition of reasoning? Peirce's answer is that the pragmaticist ought to adopt the attitude of a thorough-going critical common-sensist.

Chapters 8 and 9 in this volume develop the main tenets of Peirce's critical common-sensism. Although chapter 9 ("Issues of Pragmaticism") may be seen as an outgrowth of chapter 8 ("Pragmaticism"), the latter is no draft of the former and offers many insights that complement and clarify the denser developments found in chapter 9. Chapter 9 lists "six distinctive characters" that separate critical common-sensism from Reid's philosophy of common sense, but it would be a mistake to see this list as adding two more to the list of "four distinguishing marks" found in chapter 8, for neither list maps out the other precisely and the plan of discussion differs considerably between the two texts.

Although Peirce states that the doctrine of critical common-sensism is one that he had already defended, along with scholastic realism, in the *Journal of Speculative Philosophy* series of 1868–69, the doctrine's roots, as intimated at the beginning of this introduction, can be traced back to the treatise of metaphysics Peirce composed when he was a young twenty-three year old man, in 1862, a few years before crafting the final form of his "New List" argument. It was then that he had concluded that if one wanted to avoid the philosophical cul-de-sacs created by the exaggerations of dogmatism and criticism, the only viable road left was the middle path of a particular kind of metaphysical fideism, one that vowed to believe neither too little nor too much. If such a methodological conclusion was the result of a subtle analysis of canonical modern philosophy, it came so early in Peirce's development, however, that one cannot but surmise that it was born out of his own philosophical instinct, an instinct bathed in the scientific atmosphere of Harvard as much as nourished by the ethos of the "American scholar." Over the next forty-three year, that instinctive stance would work itself out and drive Peirce to elaborate his anti-cartesianism, his nascent pragmatism, his objective idealism, his tychism, his synechism, his agapism, and his semioticism. By 1905, Peirce was finally ready to recognize this philosophical drive for what it was and to articulate it in the form and under the name of critical common-sensism.

Critical common-sensism is not necessarily equivalent to pragmaticism. All pragmaticists, or wielders of the pragmatic maxim, ought to be critical

common-sensists, but the reverse is not true (it is not to be expected, for instance, that critical common-sensists would conduct imaginary experiments in order to observe how modified representations of beliefs could affect conditional resolutions as to conduct). There are several motivations why pragmaticists would want to adhere to critical common-sensism, besides a desire for consistency, and they may be listed as follows. (1) The only propositions and inferences that are indubitable (besides perceptual judgments) are those that turn out to be acritical in the sense that they never were the result of any sort of controlled inquiry, and thus are not the product of any belief settlement that proceeded from a recoverable doubt. (2) All acritical indubitable beliefs are vague, and this implies that the principle of contradiction does not apply to them precisely because they remain indeterminate for lack of confirming or disconfirming experience: they may very well be considered at once true and false. The belief in the order of nature is such a kind of intrinsically vague belief: any attempt to define it with precision will excite doubt, but there always remains something that escapes doubt, and this is practically shown in the impossibility to think that there is no order in nature. (3) Vagueness is real and irreducible. (4) Instinct is the manner we relate to or are governed by the stock of acritical indubitable beliefs. The stock of these "original" beliefs is pretty much fixed, not absolutely so, but its variations take place so slowly and minutely as to be practically negligible. (5) The advent of reasoning coincides with the gradual development of self-control, which is a gradual "outgrowing of the applicability of instinct." Old beliefs tend to lose their applicability when the world of experience becomes too different from what it once was; beliefs then get overstretched up to a breaking point, lose their indubitability, and become criticizable. (6) Self-control takes place when the need for a new habit needs to be fulfilled, and the acquisition of such a new habit requires inquiry and deliberation. Moral self-control and logical self-control work in similar fashion although the sphere of their influence is distinct. (7) Genuine doubt is neither naïve nor artificial. A critical common-sensist economy of research recognizes that instinct is far more trustworthy than reason so that, once a particular belief has been shown to resist criticism, there is no point pretending not to adopt it. At the same time, any candidate for the position of first premise needs to be thoroughly criticized, analyzed, tested, experimented in imagination, following custom-made methodology, before one would declare it beyond doubt – though only for now. (8) The critical common-sensist is a thorough-going fallibilist, so much so that he keeps criticizing his own method besides those of the regular common-sensists, dogmatists, transcendentalists, and criticists.

The combination of critical common-sensism and a tricategorial scholastic realism yields pragmaticism. From the summer of 1905 to the winter of 1906, Peirce wrote a series of papers all titled "The Basis of Pragmaticism," in which he tried to work out several strategies meant to map out, if not

exactly a proof of his philosophical theorem, at least an itinerary across a landscape suggestive of its truth by means of phaneroscopic descriptions of the categories, considerations about the classification of sciences, and in-depth analyses of esthetics, ethics, and logic, the three normative sciences. A particularly elaborate version of these meanderings is found in chapter 10 in this volume. Since a detailed account of the many technically intricate arguments and sub-arguments found in that text would prevent the present introduction from fulfilling the more modest function of its title, our attention will center upon one portion at the end of it whose discussion Peirce's recasting of the pragmatic maxim at the beginning of chapter 9 calls for: "The entire intellectual purport of any symbol consists in the total of all general modes of rational conduct which, conditionally upon all the possible different circumstances and desires, would ensue upon the acceptance of the symbol." The novelty in this form of the maxim is the replacement of the word "conception" with the word "symbol." This turns out to be a fundamental substitution in the development of Peirce's pragmaticism, for "symbol" is a term vastly more precise than "conception." A symbol is a particular kind of sign, exceedingly powerful in many ways, and one of the principal focuses of Peirce's lifelong study of semiotic logic. If Peirce's pragmatic maxim, as he has consistently hammered throughout his writings, is a logical principle, it must not only be one that logic edicts, but one that breathes the very spirit of logic. It is not only a maxim of logic, but a maxim about logic. Now, logic is, in Peirce's classification of the sciences, the third of the three normative sciences, after esthetics and ethics. A large portion of chapter 10 is devoted to clarifying the notion of normativity and its connection to the dualism manifested by the three normative sciences to the extent that they are the sciences of the conditions of good and bad in their respective fields. Peirce shows that such a dualism finds its origin in the irreducibility of secondness, or in the basic mutually completing relation of action and reaction whereby two terms affect or are affected by one another in such a way that their codependence must be recognized as being real or "surd," i.e., not dependent on any description, but a dual state of things that is neither ignorable nor dicible (except that it could be pointed to). It is natural that such a duality, being prescindible from thirds, would be found within triadic phenomena, and sign relations are no exception. Truth happens to be the great concern of logic because it is a measure of the "conformity of a representamen to its object." It is important to emphasize this duality between a sign and its object: the possessive "its" indicates the essential complementarity between the two, the fact that neither would be what it is if it was not acting on or reacting to the other. The matter of truth would never arise were it not for the fact that the object is not an object until it compels a sign into being, and that the sign becomes a sign as a result of that forceful solicitation. Whether the sign manages to do justice to its object is then the question of its truth, the same

old question that agitates pragmaticism when it inquires about the relation between the singular and the general. That such a question can actually be answered and brought within the compass of thought or of the transformation of signs into further signs, is exactly the hope that the pragmaticist's faith allows one to entertain.

An object that compels a sign into being does so to fulfill a purpose that, at minimum, concerns its own future: it needs to be recognized. Recognition requires that its predicates be separated out and identified, and this is what signs do. Signs "communicate ideas," and these ideas, pace Plato and Aristotle, are those forms that the object, whether external or internal, lets out for a certain sake. Signs transform or adjust these forms so that the latter can be transmitted to other signs, their interpretants, and with each interpretance the form or idea grows (this is the chief part of "the process of the creation of the world," says Peirce). Either this process of semiotic growth has no other aim than its own gratuitous performance, or it has a further aim, and that it does so is pragmaticism's contention. Pragmaticism does not deny, as stated earlier, that the ultimate aim is to achieve reasonableness for its own sake ("the continual increase of the embodiment of the idea-potentiality is the *summum bonum*"), but it reminds us that logic itself advances that signs would not be signs if all they did was to blindly transmit forms or ideas to other symbols, again and again, without ever conveying them "into action or habits of action"; ideas indeed cannot grow if they don't get embodied in something else than symbols, such as the flesh and blood of messy experience.

As a medium of communication, a sign's mission is to substitute itself for its object so unobtrusively that in the course of influencing an interpreting sign in regard to the object, the interpretant would be modified as though it had been directly acted upon by the object although it really was so only indirectly through the sign. The object directly influences the sign, the sign directly influences the interpretant, and as a result the object indirectly influences the interpretant. This indirect influence conveyed by the sign is a process of determination that is subject to friction – the kind of friction that Peirce assimilated to vagueness in chapter 8. In conveying a form from the object, a sign does not act merely as a vehicle or a disease-inoculating mosquito but as a mediating representation that employs various strategies in order to cause its interpretant to be affected by the form while trying to be as faithful as possible to the object's purpose. But signs may easily fail in their mission of determination. Their own forms may misleadingly interfere with that of the object, or they may fail to grasp the correct form, they may represent it incompletely, or they may not find the right kind of interpretant nor an interpretant with the desired competence. As mediums, signs control their interpretants to some extent. The kind of control they exert depends on their own degree of determinacy or indeterminacy, i.e., the degree of the latitude of interpretation that the given semiotic situation allows for. Vague signs are

signs that do not express the object's form sufficiently to allow the interpretant to identify that object – whether this is due to the object's own incapacity to produce telltale forms, or to the sign's own incompetence in carrying them out. General signs are signs that are indeterminate by design so as to solicit the interpretant's own input: the interpretant is empowered to complete the determination as it pleases. Clearly, either kind of latitude affects the interpretational process, and thus affects the achievement of the purpose that motivates the object's influence. What interpretation consists in is therefore an essential question, one that, as Peirce puts it, may either "establish or refute the doctrine of pragmaticism."

These semiotic considerations naturally bring us to the last text by Peirce in this volume, "Pragmatism." This text, which is the third out of five versions of an article Peirce failed to convince the editors of the *Nation* and the *Atlantic Monthly* to publish, was composed in the early spring of 1907. Responding to the surge of international interest in pragmatism as well as to the many controversies raging in philosophical journals, Peirce eagerly rejoins the debate and sets out to explain what pragmatism actually is: not a doctrine of metaphysics with any sort of dogmatic pretensions, but a method of discovering the meanings of "intellectual concepts," whether hard words or abstract concepts, through the scientific method of experimentation that seeks to observe and learn its general lessons from the results it obtains. "Intellectual concepts" are legisigns in Peirce's nomenclature of signs: they are neither mere qualisigns (signs that represent their object by virtue of being qualities of feelings) nor sinsigns (signs that fulfill their function by virtue of being existential facts), but signs that stand for their object by virtue of their being generals, which implies that they contribute to express conditional propositions spelling out how their object *would* act or behave under certain circumstances. (Not all legisigns are symbolical: one kind is iconic and two other kinds are indexical. Whether Peirce would restrict intellectual concepts to the symbolical kind only – therefore to terms, propositions, and arguments – is an open question that shall not be answered here. What matters is that such concepts are the building blocks of arguments concerning objective fact.)

The challenge Peirce gives himself is twofold: one is to redefine once more the pragmatic maxim according to these semiotic terms, and the other is to provide a demonstration of it. Thus he begins by stating what he now calls the *kernel of pragmatism* (he does not use the word "pragmaticism" probably because he wants to persuade his fellow pragmatists that what he is about to tell them touches the very core of their philosophy): "the *total* meaning of the predication of an intellectual concept consists in affirming that, under all conceivable circumstances of a given kind, the subject of the predication would (or would not) behave in a certain way," or again: "the whole meaning of an intellectual predicate is that certain kinds of events would happen, once

in so often, in the course of experience, under certain kinds of existential circumstances." Phrased in such a way, it becomes clear enough that Peirce seeks to give meaning a teleological sense. The kernel of pragmatism seeks to identify the part played by each legisign in formulating the general conditional tendencies according to which particular events that would fall under their description would tend to take place if the kind of circumstances described in the antecedent of the conditional proposition happened to be the case. Would-bes and would-acts are probable tendencies or regularities that inductive generalization concludes to; they are habits that, once ascertained and formulated, allow not only to make predictions, but also to apprehend the continuum that certain events belong to and inherit their meaning from (events that could otherwise be mistakenly seen as isolated and thus hard to explain). If so, Peirce's theory of final causation then appears to be a corollary of the reformulated maxim.

Let us close this introduction with a short presentation of Peirce's semiotic demonstration of the kernel of pragmatism.[5] His demonstration rests upon an analysis of the general structure of a sign relation that distinguishes within it, besides the representamen itself, two kinds of objects (immediate and dynamic), and three kinds of interpretants (emotional, energetic and logical). The dynamic object of the sign can never be directly expressed by the sign (this in accordance with Peirce's argument against intuition), but only alluded to partially, and this pushes the interpretant to expand its investigation so that "collateral observation" of the conditions of the sign's own appearance over various occasions helps further identify its object (though never completely). A sign's dynamic object is an individual thing, event, or rational entity, and no general description can ever capture an individual. As individual or singular as the dynamic object is, the fact that it anchors general predicates is a sufficient condition for allowing something else to become a sign of it, if only because other things share the same predicates. Collateral observation allows an idea, which may be both general and vague in different respects, to be formed about the dynamic object, and such an idea is the immediate object of the sign. It is not the result of an interpretation, but of the accretion of distinct experiences of the sign, the collection of whose manifestations will yield in time a more determinate idea of what the sign stands for. Each manifestation of the sign is accompanied by elements that suggest the kind of collateral observation needed to further expand its reach. Besides standing for objects, signs stand to interpretants: they teach other signs whatever they themselves managed to learn about the object, and urge them to pursue the

[5] Nathan Houser has ably described the major steps of that proof in the second part of his remarkable introduction to *The Essential Peirce*, vol. 2, pp. xxxv–xxxvi.

inquiry. The purpose of every sign is to determine other signs in regard to its object, and such a process of determination is continuous: it is itself of a general conditional nature, a *would-become*, and thus symbolical and inferential. Any particular train of semiosis (the irreducible triadic process among object, sign, and interpretant) is a concrete replication or manifestation of this overarching continuum. This is well shown within the sign process: there are three different kinds of interpretants that a sign generates, depending on whether its relation to the object is iconic, indexical, or symbolical. The first kind of interpretants are immediate or "emotional" (not in a psychological sense, though): they result from the simple and direct apprehension of the sign in its significant appearance (thus as something busy standing for something else) and are signs that merely acknowledge the type of "standing for" they witness; they tend to be "feelings." The second kind of interpretants are dynamic or "energetic": they are acted upon by the sign (at the urging of its object), and thus are reactions that take the form of actual deeds (obeying an order, for instance). The third kind of interpretants is crucial for pragmatism. They are the logical interpretants, those that reshape and develop the thought and direct it to further logical interpretants. They are the engine of the inferential process, and as such are in the "relatively future tense" of the would-be. Not all signs have logical interpretants: only those that are intellectual concepts and thus symbolic legisigns (or, if not symbols, sinsigns that are replicas of, and thus informed by, such legisigns).

Logical interpretants are in the conditional future because, when brought to explain (or interpret) a particular concept, they take hold of its general nature and follow it through its general consequences. Such following through gets expressed by stating that the kind of operation the concept, when predicated of an object, would entail "would be followed by a result of a definite general description." When we want to see how this logical structure manifests itself in actual mental experience, there are not many categories of facts that might correspond to it. Peirce lists them as conceptions, desires, expectations, and habits. None of the first three will do, either because they would beg the question (conceptions), or are not really logical (desires), or not conditional (expectations). This leaves us with habits as the only category of mental fact that embodies, so to speak, the true nature of the logical interpretant. What is a habit? It is "a tendency actually to behave in a similar way under similar circumstances in the future." As tendencies, habits actually influence behavior, or the way actions are conducted to produce modifications in the world of experience. Now, Peirce insists that habits are actually a special kind of logical interpretants, unlike concepts, propositions, or arguments. All the latter can do is bring in new logical interpretants to pursue the train of inference they are contributing to. Habits, on the other hand, do not bring in further logical interpretants. They are final, in both senses of the word. Final in the sense of termination because a habit is the end of the infer-

ential process (even if temporary, since habits are subject to revision): when it functions as a habit, it produces only energetic or dynamic interpretants, that is, action. And final in the sense of teleological because a habit governs the action by informing it with a purpose and thus by giving it a direction that transcends the mere committing of a deed. Peirce may therefore conclude that "the deliberately formed, self-analyzing habit is the living definition" or meaning of a conception, and "the veritable and final logical interpretant." This brings us back to the maxim or kernel of pragmatism: to describe a habit is to express the kind of action that it produces under certain circumstances and for a certain purpose, and this is formally equivalent with Peirce's philosophical theorem. This Q.E.D. concludes Peirce's semiotic demonstration of pragmatism, or, more exactly, pragmaticism.

Writings by Charles S. Peirce

THE FIXATION OF BELIEF

Charles S. Peirce. "The Fixation of Belief." *Popular Science Monthly* 12.11 (November 1877): 1–15.

I

Few persons care to study logic, because everybody conceives himself to be proficient enough in the art of reasoning already. But I observe that this satisfaction is limited to one's own ratiocination, and does not extend to that of other men.

We come to the full possession of our power of drawing inferences the last of all our faculties, for it is not so much a natural gift as a long and difficult art. The history of its practice would make a grand subject for a book. The mediaeval schoolmen, following the Romans, made logic the earliest of a boy's studies after grammar, as being very easy. So it was, as they understood it. Its fundamental principle, according to them, was, that all knowledge rests on either authority or reason; but that whatever is deduced by reason depends ultimately on a premise derived from authority. Accordingly, as soon as a boy was perfect in the syllogistic procedure, his intellectual kit of tools was held to be complete.

To Roger Bacon, that remarkable mind who in the middle of the thirteenth century was almost a scientific man, the schoolmen's conception of reasoning appeared only an obstacle to truth. He saw that experience alone teaches anything – a proposition which to us seems easy to understand, because a distinct conception of experience has been handed down to us from former generations; which to him also seemed perfectly clear, because its difficulties had not yet unfolded themselves. Of all kinds of experience, the best, he thought, was interior illumination, which teaches many things about Nature which the external senses could never discover, such as the transubstantiation of bread.

Four centuries later, the more celebrated Bacon, in the first book of his *Novum Organum*, gave his clear account of experience as something which must be open to verification and reëxamination. But, superior as Lord Bacon's conception is to earlier notions, a modern reader who is not in awe of his grandiloquence is chiefly struck by the inadequacy of his view of scientific procedure. That we have only to make some crude experiments, to draw up briefs of the results in certain blank forms, to go through these by rule, checking off everything disproved and setting down the alternatives, and that

thus in a few years physical science would be finished up – what an idea! "He wrote on science like a Lord Chancellor," indeed.

The early scientists, Copernicus, Tycho Brahe, Kepler, Galileo, and Gilbert, had methods more like those of their modern brethren. Kepler undertook to draw a curve through the places of Mars;[1] and his greatest service to science was in impressing on men's minds that this was the thing to be done if they wished to improve astronomy; that they were not to content themselves with inquiring whether one system of epicycles was better than another, but that they were to sit down to the figures and find out what the curve, in truth, was. He accomplished this by his incomparable energy and courage, blundering along in the most inconceivable way (to us), from one irrational hypothesis to another, until, after trying twenty-two of these, he fell, by the mere exhaustion of his invention, upon the orbit which a mind well furnished with the weapons of modern logic would have tried almost at the outset.

In the same way, every work of science great enough to be well remembered for a few generations affords some exemplification of the defective state of the art of reasoning of the time when it was written; and each chief step in science has been a lesson in logic. It was so when Lavoisier and his contemporaries took up the study of chemistry. The old chemist's maxim had been, "*Lege, lege, lege, labora, ora, et relege.*" Lavoisier's method was not to read and pray, not to dream that some long and complicated chemical process would have a certain effect, to put it into practice with dull patience, after its inevitable failure to dream that with some modification it would have another result, and to end by publishing the last dream as a fact: his way was to carry his mind into his laboratory, and to make of his alembics and cucurbits instruments of thought, giving a new conception of reasoning, as something which was to be done with one's eyes open, by manipulating real things instead of words and fancies.

The Darwinian controversy is, in large part, a question of logic. Mr. Darwin proposed to apply the statistical method to biology. The same thing had been done in a widely different branch of science, the theory of gases. Though unable to say what the movements of any particular molecule of gas would be on a certain hypothesis regarding the constitution of this class of bodies, Clausius and Maxwell were yet able, by the application of the doctrine of probabilities, to predict that in the long run such and such a proportion of the molecules would, under given circumstances, acquire such and such velocities; that there would take place, every second, such and such a number of collisions, etc.; and from these propositions were able to deduce certain properties of gases, especially in regard to their heat-relations. In like manner,

[1] Not quite so, but as nearly so as can be told in a few words.

Darwin, while unable to say what the operation of variation and natural selection in any individual case will be, demonstrates that in the long run they will adapt animals to their circumstances. Whether or not existing animal forms are due to such action, or what position the theory ought to take, forms the subject of a discussion in which questions of fact and questions of logic are curiously interlaced.

II

The object of reasoning is to find out, from the consideration of what we already know, something else which we do not know. Consequently, reasoning is good if it be such as to give a true conclusion from true premises, and not otherwise. Thus, the question of its validity is purely one of fact and not of thinking. A being the premises and B the conclusion, the question is, whether these facts are really so related that if A is B is. If so, the inference is valid; if not, not. It is not in the least the question whether, when the premises are accepted by the mind, we feel an impulse to accept the conclusion also. It is true that we do generally reason correctly by nature. But that is an accident; the true conclusion would remain true if we had no impulse to accept it; and the false one would remain false, though we could not resist the tendency to believe in it.

We are, doubtless, in the main logical animals, but we are not perfectly so. Most of us, for example, are naturally more sanguine and hopeful than logic would justify. We seem to be so constituted that in the absence of any facts to go upon we are happy and self-satisfied; so that the effect of experience is continually to contract our hopes and aspirations. Yet a lifetime of the application of this corrective does not usually eradicate our sanguine disposition. Where hope is unchecked by any experience, it is likely that our optimism is extravagant. Logicality in regard to practical matters is the most useful quality an animal can possess, and might, therefore, result from the action of natural selection; but outside of these it is probably of more advantage to the animal to have his mind filled with pleasing and encouraging visions, independently of their truth; and thus, upon unpractical subjects, natural selection might occasion a fallacious tendency of thought.

That which determines us, from given premises, to draw one inference rather than another, is some habit of mind, whether it be constitutional or acquired. The habit is good or otherwise, according as it produces true conclusions from true premises or not; and an inference is regarded as valid or not, without reference to the truth or falsity of its conclusion specially, but according as the habit which determines it is such as to produce true conclusions in general or not. The particular habit of mind which governs this or that inference may be formulated in a proposition whose truth depends on the validity of the inferences which the habit determines; and such a formula

is called a *guiding principle* of inference. Suppose, for example, that we observe that a rotating disk of copper quickly comes to rest when placed between the poles of a magnet, and we infer that this will happen with every disk of copper. The guiding principle is, that what is true of one piece of copper is true of another. Such a guiding principle with regard to copper would be much safer than with regard to many other substances – brass, for example.

A book might be written to signalize all the most important of these guiding principles of reasoning. It would probably be, we must confess, of no service to a person whose thought is directed wholly to practical subjects, and whose activity moves along thoroughly-beaten paths. The problems which present themselves to such a mind are matters of routine which he has learned once for all to handle in learning his business. But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will ofttimes lose his orientation and waste his efforts in directions which bring him no nearer to his goal, or even carry him entirely astray. He is like a ship in the open sea, with no one on board who understands the rules of navigation. And in such a case some general study of the guiding principles of reasoning would be sure to be found useful.

The subject could hardly be treated, however, without being first limited; since almost any fact may serve as a guiding principle. But it so happens that there exists a division among facts, such that in one class are all those which are absolutely essential as guiding principles, while in the others are all which have any other interest as objects of research. This division is between those which are necessarily taken for granted in asking whether a certain conclusion follows from certain premises, and those which are not implied in that question. A moment's thought will show that a variety of facts are already assumed when the logical question is first asked. It is implied, for instance, that there are such states of mind as doubt and belief – that a passage from one to the other is possible, the object of thought remaining the same, and that this transition is subject to some rules which all minds are alike bound by. As these are facts which we must already know before we can have any clear conception of reasoning at all, it cannot be supposed to be any longer of much interest to inquire into their truth or falsity. On the other hand, it is easy to believe that those rules of reasoning which are deduced from the very idea of the process are the ones which are the most essential; and, indeed, that so long as it conforms to these it will, at least, not lead to false conclusions from true premises. In point of fact, the importance of what may be deduced from the assumptions involved in the logical question turns out to be greater than might be supposed, and this for reasons which it is difficult to exhibit at the outset. The only one which I shall here mention is, that conceptions which are really products of logical reflection, without being readily seen to

be so, mingle with our ordinary thoughts, and are frequently the causes of great confusion. This is the case, for example, with the conception of quality. A quality as such is never an object of observation. We can see that a thing is blue or green, but the quality of being blue and the quality of being green are not things which we see; they are products of logical reflection. The truth is, that common-sense, or thought as it first emerges above the level of the narrowly practical, is deeply imbued with that bad logical quality to which the epithet *metaphysical* is commonly applied; and nothing can clear it up but a severe course of logic.

III

We generally know when we wish to ask a question and when we wish to pronounce a judgment, for there is a dissimilarity between the sensation of doubting and that of believing.

But this is not all which distinguishes doubt from belief. There is a practical difference. Our beliefs guide our desires and shape our actions. The Assassins, or followers of the Old Man of the Mountain, used to rush into death at his least command, because they believed that obedience to him would insure everlasting felicity. Had they doubted this, they would not have acted as they did. So it is with every belief, according to its degree. The feeling of believing is a more or less sure indication of there being established in our nature some habit which will determine our actions. Doubt never has such an effect.

Nor must we overlook a third point of difference. Doubt is an uneasy and dissatisfied state from which we struggle to free ourselves and pass into the state of belief; while the latter is a calm and satisfactory state which we do not wish to avoid, or to change to a belief in anything else.[2] On the contrary, we cling tenaciously, not merely to believing, but to believing just what we do believe.

Thus, both doubt and belief have positive effects upon us, though very different ones. Belief does not make us act at once, but puts us into such a condition that we shall behave in some certain way, when the occasion arises. Doubt has not the least effect of this sort, but stimulates us to action until it is destroyed. This reminds us of the irritation of a nerve and the reflex action produced thereby; while for the analogue of belief, in the nervous system, we must look to what are called nervous associations – for example, to that habit of the nerves in consequence of which the smell of a peach will make the mouth water.

[2] I am not speaking of secondary effects occasionally produced by the interference of other impulses.

IV

The irritation of doubt causes a struggle to attain a state of belief. I shall term this struggle *inquiry*, though it must be admitted that this is sometimes not a very apt designation.

The irritation of doubt is the only immediate motive for the struggle to attain belief. It is certainly best for us that our beliefs should be such as may truly guide our actions so as to satisfy our desires; and this reflection will make us reject any belief which does not seem to have been so formed as to insure this result. But it will only do so by creating a doubt in the place of that belief. With the doubt, therefore, the struggle begins, and with the cessation of doubt it ends. Hence, the sole object of inquiry is the settlement of opinion. We may fancy that this is not enough for us, and that we seek, not merely an opinion, but a true opinion. But put this fancy to the test, and it proves groundless; for as soon as a firm belief is reached we are entirely satisfied, whether the belief be true or false. And it is clear that nothing out of the sphere of our knowledge can be our object, for nothing which does not affect the mind can be the motive for a mental effort. The most that can be maintained is, that we seek for a belief that we shall *think* to be true. But we think each one of our beliefs to be true, and, indeed, it is mere tautology to say so.

That the settlement of opinion is the sole end of inquiry is a very important proposition. It sweeps away, at once, various vague and erroneous conceptions of proof. A few of these may be noticed here.

1. Some philosophers have imagined that to start an inquiry it was only necessary to utter a question or set it down upon paper, and have even recommended us to begin our studies with questioning everything! But the mere putting of a proposition into the interrogative form does not stimulate the mind to any struggle after belief. There must be a real and living doubt, and without this all discussion is idle.

2. It is a very common idea that a demonstration must rest on some ultimate and absolutely indubitable propositions. These, according to one school, are first principles of a general nature; according to another, are first sensations. But, in point of fact, an inquiry, to have that completely satisfactory result called demonstration, has only to start with propositions perfectly free from all actual doubt. If the premises are not in fact doubted at all, they cannot be more satisfactory than they are.

3. Some people seem to love to argue a point after all the world is fully convinced of it. But no further advance can be made. When doubt ceases, mental action on the subject comes to an end; and, if it did go on, it would be without a purpose.

V

If the settlement of opinion is the sole object of inquiry, and if belief is of the nature of a habit, why should we not attain the desired end, by taking any answer to a question which we may fancy, and constantly reiterating it to ourselves, dwelling on all which may conduce to that belief, and learning to turn with contempt and hatred from anything which might disturb it? This simple and direct method is really pursued by many men. I remember once being entreated not to read a certain newspaper lest it might change my opinion upon free-trade. "Lest I might be entrapped by its fallacies and misstatements," was the form of expression. "You are not," my friend said, "a special student of political economy. You might, therefore, easily be deceived by fallacious arguments upon the subject. You might, then, if you read this paper, be led to believe in protection. But you admit that free-trade is the true doctrine; and you do not wish to believe what is not true." I have often known this system to be deliberately adopted. Still oftener, the instinctive dislike of an undecided state of mind, exaggerated into a vague dread of doubt, makes men cling spasmodically to the views they already take. The man feels that, if he only holds to his belief without wavering, it will be entirely satisfactory. Nor can it be denied that a steady and immovable faith yields great peace of mind. It may, indeed, give rise to inconveniences, as if a man should resolutely continue to believe that fire would not burn him, or that he would be eternally damned if he received his *ingesta* otherwise than through a stomach-pump. But then the man who adopts this method will not allow that its inconveniences are greater than its advantages. He will say, "I hold steadfastly to the truth, and the truth is always wholesome." And in many cases it may very well be that the pleasure he derives from his calm faith overbalances any inconveniences resulting from its deceptive character. Thus, if it be true that death is annihilation, then the man who believes that he will certainly go straight to heaven when he dies, provided he have fulfilled certain simple observances in this life, has a cheap pleasure which will not be followed by the least disappointment. A similar consideration seems to have weight with many persons in religious topics, for we frequently hear it said, "Oh, I could not believe so-and-so, because I should be wretched if I did." When an ostrich buries its head in the sand as danger approaches, it very likely takes the happiest course. It hides the danger, and then calmly says there is no danger; and, if it feels perfectly sure there is none, why should it raise its head to see? A man may go through life, systematically keeping out of view all that might cause a change in his opinions, and if he only succeeds – basing his method, as he does, on two fundamental psychological laws – I do not see what can be said against his doing so. It would be an egotistical impertinence to object that his procedure is irrational, for that only amounts to saying that his method of settling belief is not ours. He does not propose to himself to be rational, and, indeed, will often talk with scorn of man's weak and illusive reason. So let him think as he pleases.

But this method of fixing belief, which may be called the method of tenacity, will be unable to hold its ground in practice. The social impulse is against it. The man who adopts it will find that other men think differently from him, and it will be apt to occur to him, in some saner moment, that their opinions are quite as good as his own, and this will shake his confidence in his belief. This conception, that another man's thought or sentiment may be equivalent to one's own, is a distinctly new step, and a highly important one. It arises from an impulse too strong in man to be suppressed, without danger of destroying the human species. Unless we make ourselves hermits, we shall necessarily influence each other's opinions; so that the problem becomes how to fix belief, not in the individual merely, but in the community.

Let the will of the state act, then, instead of that of the individual. Let an institution be created which shall have for its object to keep correct doctrines before the attention of the people, to reiterate them perpetually, and to teach them to the young; having at the same time power to prevent contrary doctrines from being taught, advocated, or expressed. Let all possible causes of a change of mind be removed from men's apprehensions. Let them be kept ignorant, lest they should learn of some reason to think otherwise than they do. Let their passions be enlisted, so that they may regard private and unusual opinions with hatred and horror. Then, let all men who reject the established belief be terrified into silence. Let the people turn out and tar-and-feather such men, or let inquisitions be made into the manner of thinking of suspected persons, and when they are found guilty of forbidden beliefs, let them be subjected to some signal punishment. When complete agreement could not otherwise be reached, a general massacre of all who have not thought in a certain way has proved a very effective means of settling opinion in a country. If the power to do this be wanting, let a list of opinions be drawn up, to which no man of the least independence of thought can assent, and let the faithful be required to accept all these propositions, in order to segregate them as radically as possible from the influence of the rest of the world.

This method has, from the earliest times, been one of the chief means of upholding correct theological and political doctrines, and of preserving their universal or catholic character. In Rome, especially, it has been practised from the days of Numa Pompilius to those of Pius Nonus. This is the most perfect example in history; but wherever there is a priesthood – and no religion has been without one – this method has been more or less made use of. Wherever there is an aristocracy, or a guild, or any association of a class of men whose interests depend or are supposed to depend on certain propositions, there will be inevitably found some traces of this natural product of social feeling. Cruelties always accompany this system; and when it is consistently carried out, they become atrocities of the most horrible kind in the eyes of any rational man. Nor should this occasion surprise, for the officer of a society does not feel justified in surrendering the interests of that society for the sake

of mercy, as he might his own private interests. It is natural, therefore, that sympathy and fellowship should thus produce a most ruthless power.

In judging this method of fixing belief, which may be called the method of authority, we must, in the first place, allow its immeasurable mental and moral superiority to the method of tenacity. Its success is proportionately greater; and, in fact, it has over and over again worked the most majestic results. The mere structures of stone which it has caused to be put together – in Siam, for example, in Egypt, and in Europe – have many of them a sublimity hardly more than rivaled by the greatest works of Nature. And, except the geological epochs, there are no periods of time so vast as those which are measured by some of these organized faiths. If we scrutinize the matter closely, we shall find that there has not been one of their creeds which has remained always the same; yet the change is so slow as to be imperceptible during one person's life, so that individual belief remains sensibly fixed. For the mass of mankind, then, there is perhaps no better method than this. If it is their highest impulse to be intellectual slaves, then slaves they ought to remain.

But no institution can undertake to regulate opinions upon every subject. Only the most important ones can be attended to, and on the rest men's minds must be left to the action of natural causes. This imperfection will be no source of weakness so long as men are in such a state of culture that one opinion does not influence another – that is, so long as they cannot put two and two together. But in the most priestridden states some individuals will be found who are raised above that condition. These men possess a wider sort of social feeling; they see that men in other countries and in other ages have held to very different doctrines from those which they themselves have been brought up to believe; and they cannot help seeing that it is the mere accident of their having been taught as they have, and of their having been surrounded with the manners and associations they have, that has caused them to believe as they do and not far differently. And their candor cannot resist the reflection that there is no reason to rate their own views at a higher value than those of other nations and other centuries; and this gives rise to doubts in their minds.

They will further perceive that such doubts as these must exist in their minds with reference to every belief which seems to be determined by the caprice either of themselves or of those who originated the popular opinions. The willful adherence to a belief, and the arbitrary forcing of it upon others, must, therefore, both be given up, and a new method of settling opinions must be adopted, which shall not only produce an impulse to believe, but shall also decide what proposition it is which is to be believed. Let the action of natural preferences be unimpeded, then, and under their influence let men, conversing together and regarding matters in different lights, gradually develop beliefs in harmony with natural causes. This method resembles that by which

conceptions of art have been brought to maturity. The most perfect example of it is to be found in the history of metaphysical philosophy. Systems of this sort have not usually rested upon any observed facts, at least not in any great degree. They have been chiefly adopted because their fundamental propositions seemed "agreeable to reason." This is an apt expression; it does not mean that which agrees with experience, but that which we find ourselves inclined to believe. Plato, for example, finds it agreeable to reason that the distances of the celestial spheres from one another should be proportional to the different lengths of strings which produce harmonious chords. Many philosophers have been led to their main conclusions by considerations like this; but this is the lowest and least developed form which the method takes, for it is clear that another man might find Kepler's theory, that the celestial spheres are proportional to the inscribed and circumscribed spheres of the different regular solids, more agreeable to *his* reason. But the shock of opinions will soon lead men to rest on preferences of a far more universal nature. Take, for example, the doctrine that man only acts selfishly – that is, from the consideration that acting in one way will afford him more pleasure than acting in another. This rests on no fact in the world, but it has had a wide acceptance as being the only reasonable theory.

This method is far more intellectual and respectable from the point of view of reason than either of the others which we have noticed. But its failure has been the most manifest. It makes of inquiry something similar to the development of taste; but taste, unfortunately, is always more or less a matter of fashion, and accordingly metaphysicians have never come to any fixed agreement, but the pendulum has swung backward and forward between a more material and a more spiritual philosophy, from the earliest times to the latest. And so from this, which has been called the *a priori* method, we are driven, in Lord Bacon's phrase, to a true induction. We have examined into this *a priori* method as something which promised to deliver our opinions from their accidental and capricious element. But development, while it is a process which eliminates the effect of some casual circumstances, only magnifies that of others. This method, therefore, does not differ in a very essential way from that of authority. The government may not have lifted its finger to influence my convictions; I may have been left outwardly quite free to choose, we will say, between monogamy and polygamy, and, appealing to my conscience only, I may have concluded that the latter practice is in itself licentious. But when I come to see that the chief obstacle to the spread of Christianity among a people of as high culture as the Hindoos has been a conviction of the immorality of our way of treating women, I cannot help seeing that, though governments do not interfere, sentiments in their development will be very greatly determined by accidental causes. Now, there are some people, among whom I must suppose that my reader is to be found, who, when they see that any belief of theirs is determined by any circumstance

extraneous to the facts, will from that moment not merely admit in words that that belief is doubtful, but will experience a real doubt of it, so that it ceases to be a belief.

To satisfy our doubts, therefore, it is necessary that a method should be found by which our beliefs may be caused by nothing human, but by some external permanency – by something upon which our thinking has no effect. Some mystics imagine that they have such a method in a private inspiration from on high. But that is only a form of the method of tenacity, in which the conception of truth as something public is not yet developed. Our external permanency would not be external, in our sense, if it was restricted in its influence to one individual. It must be something which affects, or might affect, every man. And, though these affections are necessarily as various as are individual conditions, yet the method must be such that the ultimate conclusion of every man shall be the same. Such is the method of science. Its fundamental hypothesis, restated in more familiar language, is this: There are real things, whose characters are entirely independent of our opinions about them; those realities affect our senses according to regular laws, and, though our sensations are as different as are our relations to the objects, yet, by taking advantage of the laws of perception, we can ascertain by reasoning how things really and truly are, and any man, if he have sufficient experience and reason enough about it, will be led to the one true conclusion. The new conception here involved is that of reality. It may be asked how I know that there are any realities. If this hypothesis is the sole support of my method of inquiry, my method of inquiry must not be used to support my hypothesis. The reply is this: 1. If investigation cannot be regarded as proving that there are real things, it at least does not lead to a contrary conclusion; but the method and the conception on which it is based remain ever in harmony. No doubts of the method, therefore, necessarily arise from its practice, as is the case with all the others. 2. The feeling which gives rise to any method of fixing belief is a dissatisfaction at two repugnant propositions. But here already is a vague concession that there is some *one* thing to which a proposition should conform. Nobody, therefore, can really doubt that there are realities, or, if he did, doubt would not be a source of dissatisfaction. The hypothesis, therefore, is one which every mind admits. So that the social impulse does not cause me to doubt it. 3. Everybody uses the scientific method about a great many things, and only ceases to use it when he does not know how to apply it. 4. Experience of the method has not led me to doubt it, but, on the contrary, scientific investigation has had the most wonderful triumphs in the way of settling opinion. These afford the explanation of my not doubting the method or the hypothesis which it supposes; and not having any doubt, nor believing that anybody else whom I could influence has, it would be the merest babble for me to say more about it. If there be anybody with a living doubt upon the subject, let him consider it.

To describe the method of scientific investigation is the object of this series of papers. At present I have only room to notice some points of contrast between it and other methods of fixing belief.

This is the only one of the four methods which presents any distinction of a right and a wrong way. If I adopt the method of tenacity and shut myself out from all influences, whatever I think necessary to doing this is necessary according to that method. So with the method of authority: the state may try to put down heresy by means which, from a scientific point of view, seem very ill-calculated to accomplish its purposes; but the only test *on that method* is what the state thinks, so that it cannot pursue the method wrongly. So with the *a priori* method. The very essence of it is to think as one is inclined to think. All metaphysicians will be sure to do that, however they may be inclined to judge each other to be perversely wrong. The Hegelian system recognizes every natural tendency of thought as logical, although it be certain to be abolished by counter-tendencies. Hegel thinks there is a regular system in the succession of these tendencies, in consequence of which, after drifting one way and the other for a long time, opinion will at last go right. And it is true that metaphysicians get the right ideas at last; Hegel's system of Nature represents tolerably the science of that day; and one may be sure that whatever scientific investigation has put out of doubt will presently receive *a priori* demonstration on the part of the metaphysicians. But with the scientific method the case is different. I may start with known and observed facts to proceed to the unknown; and yet the rules which I follow in doing so may not be such as investigation would approve. The test of whether I am truly following the method is not an immediate appeal to my feelings and purposes, but, on the contrary, itself involves the application of the method. Hence it is that bad reasoning as well as good reasoning is possible; and this fact is the foundation of the practical side of logic.

It is not to be supposed that the first three methods of settling opinion present no advantage whatever over the scientific method. On the contrary, each has some peculiar convenience of its own. The *a priori* method is distinguished for its comfortable conclusions. It is the nature of the process to adopt whatever belief we are inclined to, and there are certain flatteries to the vanity of man which we all believe by nature, until we are awakened from our pleasing dream by rough facts. The method of authority will always govern the mass of mankind; and those who wield the various forms of organized force in the state will never be convinced that dangerous reasoning ought not to be suppressed in some way. If liberty of speech is to be untrammeled from the grosser forms of constraint, then uniformity of opinion will be secured by a moral terrorism to which the respectability of society will give its thorough approval. Following the method of authority is the path of peace. Certain non-conformities are permitted; certain others (considered unsafe) are forbidden. These are different in different countries and in different

ages; but, wherever you are, let it be known that you seriously hold a tabooed belief, and you may be perfectly sure of being treated with a cruelty less brutal but more refined than hunting you like a wolf. Thus, the greatest intellectual benefactors of mankind have never dared, and dare not now, to utter the whole of their thought; and thus a shade of *prima facie* doubt is cast upon every proposition which is considered essential to the security of society. Singularly enough, the persecution does not all come from without; but a man torments himself and is oftentimes most distressed at finding himself believing propositions which he has been brought up to regard with aversion. The peaceful and sympathetic man will, therefore, find it hard to resist the temptation to submit his opinions to authority. But most of all I admire the method of tenacity for its strength, simplicity, and directness. Men who pursue it are distinguished for their decision of character, which becomes very easy with such a mental rule. They do not waste time in trying to make up their minds what they want, but, fastening like lightning upon whatever alternative comes first, they hold to it to the end, whatever happens, without an instant's irresolution. This is one of the splendid qualities which generally accompany brilliant, unlasting success. It is impossible not to envy the man who can dismiss reason, although we know how it must turn out at last.

Such are the advantages which the other methods of settling opinion have over scientific investigation. A man should consider well of them; and then he should consider that, after all, he wishes his opinions to coincide with the fact, and that there is no reason why the results of those three methods should do so. To bring about this effect is the prerogative of the method of science. Upon such considerations he has to make his choice – a choice which is far more than the adoption of any intellectual opinion, which is one of the ruling decisions of his life, to which, when once made, he is bound to adhere. The force of habit will sometimes cause a man to hold on to old beliefs, after he is in a condition to see that they have no sound basis. But reflection upon the state of the case will overcome these habits, and he ought to allow reflection its full weight. People sometimes shrink from doing this, having an idea that beliefs are wholesome which they cannot help feeling rest on nothing. But let such persons suppose an analogous though different case from their own. Let them ask themselves what they would say to a reformed Mussulman who should hesitate to give up his old notions in regard to the relations of the sexes; or to a reformed Catholic who should still shrink from reading the Bible. Would they not say that these persons ought to consider the matter fully, and clearly understand the new doctrine, and then ought to embrace it, in its entirety? But, above all, let it be considered that what is more wholesome than any particular belief is integrity of belief, and that to avoid looking into the support of any belief from a fear that it may turn out rotten is quite as immoral as it is disadvantageous. The person who confesses that there is such a thing as truth, which is distinguished from falsehood simply

by this, that if acted on it will carry us to the point we aim at and not astray, and then, though convinced of this, dares not know the truth and seeks to avoid it, is in a sorry state of mind indeed.

Yes, the other methods do have their merits: a clear logical conscience does cost something – just as any virtue, just as all that we cherish, costs us dear. But we should not desire it to be otherwise. The genius of a man's logical method should be loved and reverenced as his bride, whom he has chosen from all the world. He need not contemn the others; on the contrary, he may honor them deeply, and in doing so he only honors her the more. But she is the one that he has chosen, and he knows that he was right in making that choice. And having made it, he will work and fight for her, and will not complain that there are blows to take, hoping that there may be as many and as hard to give, and will strive to be the worthy knight and champion of her from the blaze of whose splendors he draws his inspiration and his courage.

HOW TO MAKE OUR IDEAS CLEAR

Charles S. Peirce. "How to Make Our Ideas Clear." *Popular Science Monthly* 12.1 (January 1878): 286–302.

I

Whoever has looked into a modern treatise on logic of the common sort, will doubtless remember the two distinctions between *clear* and *obscure* conceptions, and between *distinct* and *confused* conceptions. They have lain in the books now for nigh two centuries, unimproved and unmodified, and are generally reckoned by logicians as among the gems of their doctrine.

A clear idea is defined as one which is so apprehended that it will be recognized wherever it is met with, and so that no other will be mistaken for it. If it fails of this clearness, it is said to be obscure.

This is rather a neat bit of philosophical terminology; yet, since it is clearness that they were defining, I wish the logicians had made their definition a little more plain. Never to fail to recognize an idea, and under no circumstances to mistake another for it, let it come in how recondite a form it may, would indeed imply such prodigious force and clearness of intellect as is seldom met with in this world. On the other hand, merely to have such an acquaintance with the idea as to have become familiar with it, and to have lost all hesitancy in recognizing it in ordinary cases, hardly seems to deserve the name of clearness of apprehension, since after all it only amounts to a subjective feeling of mastery which may be entirely mistaken. I take it, however, that when the logicians speak of "clearness," they mean nothing more than such a familiarity with an idea, since they regard the quality as but a small merit, which needs to be supplemented by another, which they call *distinctness*.

A distinct idea is defined as one which contains nothing which is not clear. This is technical language; by the *contents* of an idea logicians understand whatever is contained in its definition. So that an idea is *distinctly* apprehended, according to them, when we can give a precise definition of it, in abstract terms. Here the professional logicians leave the subject; and I would not have troubled the reader with what they have to say, if it were not such a striking example of how they have been slumbering through ages of intellectual activity, listlessly disregarding the enginery of modern thought, and never dreaming of applying its lessons to the improvement of logic. It is easy to show that the doctrine that familiar use and abstract distinctness make the perfection of apprehension has its only true place in philosophies which have

long been extinct; and it is now time to formulate the method of attaining to a more perfect clearness of thought, such as we see and admire in the thinkers of our own time.

When Descartes set about the reconstruction of philosophy, his first step was to (theoretically) permit skepticism and to discard the practice of the schoolmen of looking to authority as the ultimate source of truth. That done, he sought a more natural fountain of true principles, and professed to find it in the human mind; thus passing, in the directest way, from the method of authority to that of apriority, as described in my first paper. Self-consciousness was to furnish us with our fundamental truths, and to decide what was agreeable to reason. But since, evidently, not all ideas are true, he was led to note, as the first condition of infallibility, that they must be clear. The distinction between an idea *seeming* clear and really being so, never occurred to him. Trusting to introspection, as he did, even for a knowledge of external things, why should he question its testimony in respect to the contents of our own minds? But then, I suppose, seeing men, who seemed to be quite clear and positive, holding opposite opinions upon fundamental principles, he was further led to say that clearness of ideas is not sufficient, but that they need also to be distinct, i.e., to have nothing unclear about them. What he probably meant by this (for he did not explain himself with precision) was, that they must sustain the test of dialectical examination; that they must not only seem clear at the outset, but that discussion must never be able to bring to light points of obscurity connected with them.

Such was the distinction of Descartes, and one sees that it was precisely on the level of his philosophy. It was somewhat developed by Leibnitz. This great and singular genius was as remarkable for what he failed to see as for what he saw. That a piece of mechanism could not do work perpetually without being fed with power in some form, was a thing perfectly apparent to him; yet he did not understand that the machinery of the mind can only transform knowledge, but never originate it, unless it be fed with facts of observation. He thus missed the most essential point of the Cartesian philosophy, which is, that to accept propositions which seem perfectly evident to us is a thing which, whether it be logical or illogical, we cannot help doing. Instead of regarding the matter in this way, he sought to reduce the first principles of science to formulas which cannot be denied without self-contradiction, and was apparently unaware of the great difference between his position and that of Descartes. So he reverted to the old formalities of logic, and, above all, abstract definitions played a great part in his philosophy. It was quite natural, therefore, that on observing that the method of Descartes labored under the difficulty that we may seem to ourselves to have clear apprehensions of ideas which in truth are very hazy, no better remedy occurred to him than to require an abstract definition of every important term. Accordingly, in adopting the distinction of *clear* and *distinct* notions, he described the latter

quality as the clear apprehension of everything contained in the definition; and the books have ever since copied his words. There is no danger that his chimerical scheme will ever again be over-valued. Nothing new can ever be learned by analyzing definitions. Nevertheless, our existing beliefs can be set in order by this process, and order is an essential element of intellectual economy, as of every other. It may be acknowledged, therefore, that the books are right in making familiarity with a notion the first step toward clearness of apprehension, and the defining of it the second. But in omitting all mention of any higher perspicuity of thought, they simply mirror a philosophy which was exploded a hundred years ago. That much-admired "ornament of logic" – the doctrine of clearness and distinctness – may be pretty enough, but it is high time to relegate to our cabinet of curiosities the antique *bijou*, and to wear about us something better adapted to modern uses.

The very first lesson that we have a right to demand that logic shall teach us is, how to make our ideas clear; and a most important one it is, depreciated only by minds who stand in need of it. To know what we think, to be masters of our own meaning, will make a solid foundation for great and weighty thought. It is most easily learned by those whose ideas are meagre and restricted; and far happier they than such as wallow helplessly in a rich mud of conceptions. A nation, it is true, may, in the course of generations, overcome the disadvantage of an excessive wealth of language and its natural concomitant, a vast, unfathomable deep of ideas. We may see it in history, slowly perfecting its literary forms, sloughing at length its metaphysics, and, by virtue of the untirable patience which is often a compensation, attaining great excellence in every branch of mental acquirement. The page of history is not yet unrolled which is to tell us whether such a people will or will not in the long-run prevail over one whose ideas (like the words of their language) are few, but which possesses a wonderful mastery over those which it has. For an individual, however, there can be no question that a few clear ideas are worth more than many confused ones. A young man would hardly be persuaded to sacrifice the greater part of his thoughts to save the rest; and the muddled head is the least apt to see the necessity of such a sacrifice. Him we can usually only commiserate, as a person with a congenital defect. Time will help him, but intellectual maturity with regard to clearness comes rather late, an unfortunate arrangement of Nature, inasmuch as clearness is of less use to a man settled in life, whose errors have in great measure had their effect, than it would be to one whose path lies before him. It is terrible to see how a single unclear idea, a single formula without meaning, lurking in a young man's head, will sometimes act like an obstruction of inert matter in an artery, hindering the nutrition of the brain, and condemning its victim to pine away in the fullness of his intellectual vigor and in the midst of intellectual plenty. Many a man has cherished for years as his hobby some vague shadow of an idea, too meaningless to be positively false; he has, nevertheless, passion-

ately loved it, has made it his companion by day and by night, and has given to it his strength and his life, leaving all other occupations for its sake, and in short has lived with it and for it, until it has become, as it were, flesh of his flesh and bone of his bone; and then he has waked up some bright morning to find it gone, clean vanished away like the beautiful Melusina of the fable, and the essence of his life gone with it. I have myself known such a man; and who can tell how many histories of circle-squarers, metaphysicians, astrologers, and what not, may not be told in the old German story?

II

The principles set forth in the first part of these papers lead, at once, to a method of reaching a clearness of thought of a far higher grade than the "distinctness" of the logicians. We have there found that the action of thought is excited by the irritation of doubt, and ceases when belief is attained; so that the production of belief is the sole function of thought. All these words, however, are too strong for my purpose. It is as if I had described the phenomena as they appear under a mental microscope. Doubt and Belief, as the words are commonly employed, relate to religious or other grave discussions. But here I use them to designate the starting of any question, no matter how small or how great, and the resolution of it. If, for instance, in a horse-car, I pull out my purse and find a five-cent nickel and five coppers, I decide, while my hand is going to the purse, in which way I will pay my fare. To call such a question Doubt, and my decision Belief, is certainly to use words very disproportionate to the occasion. To speak of such a doubt as causing an irritation which needs to be appeased, suggests a temper which is uncomfortable to the verge of insanity. Yet, looking at the matter minutely, it must be admitted that, if there is the least hesitation as to whether I shall pay the five coppers or the nickel (as there will be sure to be, unless I act from some previously contracted habit in the matter), though irritation is too strong a word, yet I am excited to such small mental activity as may be necessary to deciding how I shall act. Most frequently doubts arise from some indecision, however momentary, in our action. Sometimes it is not so. I have, for example, to wait in a railway-station, and to pass the time I read the advertisements on the walls, I compare the advantages of different trains and different routes which I never expect to take, merely fancying myself to be in a state of hesitancy, because I am bored with having nothing to trouble me. Feigned hesitancy, whether feigned for mere amusement or with a lofty purpose, plays a great part in the production of scientific inquiry. However the doubt may originate, it stimulates the mind to an activity which may be slight or energetic, calm or turbulent. Images pass rapidly through consciousness, one incessantly melting into another, until at last, when all is over – it may be in a fraction of a second, in an hour, or after long years –

we find ourselves decided as to how we should act under such circumstances as those which occasioned our hesitation. In other words, we have attained belief.

In this process we observe two sorts of elements of consciousness, the distinction between which may best be made clear by means of an illustration. In a piece of music there are the separate notes, and there is the air. A single tone may be prolonged for an hour or a day, and it exists as perfectly in each second of that time as in the whole taken together; so that, as long as it is sounding, it might be present to a sense from which everything in the past was as completely absent as the future itself. But it is different with the air, the performance of which occupies a certain time, during the portions of which only portions of it are played. It consists in an orderliness in the succession of sounds which strike the ear at different times; and to perceive it there must be some continuity of consciousness which makes the events of a lapse of time present to us. We certainly only perceive the air by hearing the separate notes; yet we cannot be said to directly hear it, for we hear only what is present at the instant, and an orderliness of succession cannot exist in an instant. These two sorts of objects, what we are *immediately* conscious of and what we are *mediately* conscious of, are found in all consciousness. Some elements (the sensations) are completely present at every instant so long as they last, while others (like thought) are actions having beginning, middle, and end, and consist in a congruence in the succession of sensations which flow through the mind. They cannot be immediately present to us, but must cover some portion of the past or future. Thought is a thread of melody running through the succession of our sensations.

We may add that just as a piece of music may be written in parts, each part having its own air, so various systems of relationship of succession subsist together between the same sensations. These different systems are distinguished by having different motives, ideas, or functions. Thought is only one such system, for its sole motive, idea, and function is to produce belief, and whatever does not concern that purpose belongs to some other system of relations. The action of thinking may incidentally have other results; it may serve to amuse us, for example, and among *dilettanti* it is not rare to find those who have so perverted thought to the purposes of pleasure that it seems to vex them to think that the questions upon which they delight to exercise it may ever get finally settled; and a positive discovery which takes a favorite subject out of the arena of literary debate is met with ill-concealed dislike. This disposition is the very debauchery of thought. But the soul and meaning of thought, abstracted from the other elements which accompany it, though it may be voluntarily thwarted, can never be made to direct itself toward anything but the production of belief. Thought in action has for its only possible motive the attainment of thought at rest; and whatever does not refer to belief is no part of the thought itself.

And what, then, is belief? It is the demi-cadence which closes a musical phrase in the symphony of our intellectual life. We have seen that it has just three properties: First, it is something that we are aware of; second, it appeases the irritation of doubt; and, third, it involves the establishment in our nature of a rule of action, or, say for short, a *habit*. As it appeases the irritation of doubt, which is the motive for thinking, thought relaxes, and comes to rest for a moment when belief is reached. But, since belief is a rule for action, the application of which involves further doubt and further thought, at the same time that it is a stopping-place, it is also a new starting-place for thought. That is why I have permitted myself to call it thought at rest, although thought is essentially an action. The *final* upshot of thinking is the exercise of volition, and of this thought no longer forms a part; but belief is only a stadium of mental action, an effect upon our nature due to thought, which will influence future thinking.

The essence of belief is the establishment of a habit; and different beliefs are distinguished by the different modes of action to which they give rise. If beliefs do not differ in this respect, if they appease the same doubt by producing the same rule of action, then no mere differences in the manner of consciousness of them can make them different beliefs, any more than playing a tune in different keys is playing different tunes. Imaginary distinctions are often drawn between beliefs which differ only in their mode of expression; – the wrangling which ensues is real enough, however. To believe that any objects are arranged as in Fig. 1, and to believe that they are arranged as in Fig. 2, are one and the same belief; yet it is conceivable that a man should assert one proposition and deny the other. Such false distinctions do as much harm as the confusion of beliefs really different, and are among the pitfalls of which we ought constantly to beware, especially when we are upon metaphysical ground. One singular deception of this sort, which often occurs, is to mistake the sensation produced by our own unclearness of thought for a character

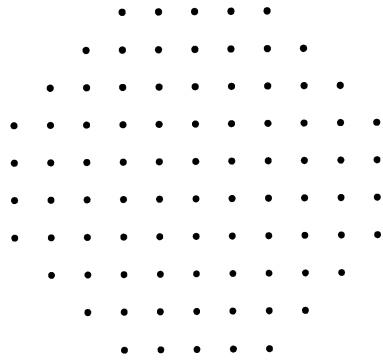

Figure 1

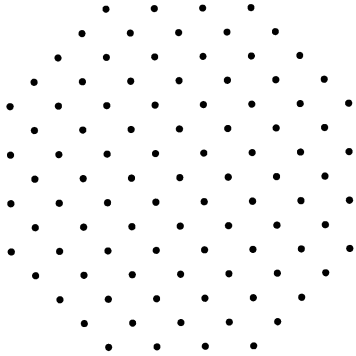

Figure 2

of the object we are thinking. Instead of perceiving that the obscurity is purely subjective, we fancy that we contemplate a quality of the object which is essentially mysterious; and if our conception be afterward presented to us in a clear form we do not recognize it as the same, owing to the absence of the feeling of unintelligibility. So long as this deception lasts, it obviously puts an impassable barrier in the way of perspicuous thinking; so that it equally interests the opponents of rational thought to perpetuate it, and its adherents to guard against it.

Another such deception is to mistake a mere difference in the grammatical construction of two words for a distinction between the ideas they express. In this pedantic age, when the general mob of writers attend so much more to words than to things, this error is common enough. When I just said that thought is an *action*, and that it consists in a *relation*, although a person performs an action but not a relation, which can only be the result of an action, yet there was no inconsistency in what I said, but only a grammatical vagueness.

From all these sophisms we shall be perfectly safe so long as we reflect that the whole function of thought is to produce habits of action; and that whatever there is connected with a thought, but irrelevant to its purpose, is an accretion to it, but no part of it. If there be a unity among our sensations which has no reference to how we shall act on a given occasion, as when we listen to a piece of music, why we do not call that thinking. To develop its meaning, we have, therefore, simply to determine what habits it produces, for what a thing means is simply what habits it involves. Now, the identity of a habit depends on how it might lead us to act, not merely under such circumstances as are likely to arise, but under such as might possibly occur, no matter how improbable they may be. What the habit is depends on *when* and *how* it causes us to act. As for the *when*, every

stimulus to action is derived from perception; as for the *how*, every purpose of action is to produce some sensible result. Thus, we come down to what is tangible and practical, as the root of every real distinction of thought, no matter how subtile it may be; and there is no distinction of meaning so fine as to consist in anything but a possible difference of practice.

To see what this principle leads to, consider in the light of it such a doctrine as that of transubstantiation. The Protestant churches generally hold that the elements of the sacrament are flesh and blood only in a tropical sense; they nourish our souls as meat and the juice of it would our bodies. But the Catholics maintain that they are literally just that; although they possess all the sensible qualities of wafer-cakes and diluted wine. But we can have no conception of wine except what may enter into a belief, either –

1. That this, that, or the other, is wine; or,
2. That wine possesses certain properties.

Such beliefs are nothing but self-notifications that we should, upon occasion, act in regard to such things as we believe to be wine according to the qualities which we believe wine to possess. The occasion of such action would be some sensible perception, the motive of it to produce some sensible result. Thus our action has exclusive reference to what affects the senses, our habit has the same bearing as our action, our belief the same as our habit, our conception the same as our belief; and we can consequently mean nothing by wine but what has certain effects, direct or indirect, upon our senses; and to talk of something as having all the sensible characters of wine, yet being in reality blood, is senseless jargon. Now, it is not my object to pursue the theological question; and having used it as a logical example I drop it, without caring to anticipate the theologian's reply. I only desire to point out how impossible it is that we should have an idea in our minds which relates to anything but conceived sensible effects of things. Our idea of anything *is* our idea of its sensible effects; and if we fancy that we have any other we deceive ourselves, and mistake a mere sensation accompanying the thought for a part of the thought itself. It is absurd to say that thought has any meaning unrelated to its only function. It is foolish for Catholics and Protestants to fancy themselves in disagreement about the elements of the sacrament, if they agree in regard to all their sensible effects, here or hereafter.

It appears, then, that the rule for attaining the third grade of clearness of apprehension is as follows: Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object.

III

Let us illustrate this rule by some examples; and, to begin with the simplest one possible, let us ask what we mean by calling a thing *hard*. Evidently that it will not be scratched by many other substances. The whole conception of this quality, as of every other, lies in its conceived effects. There is absolutely no difference between a hard thing and a soft thing so long as they are not brought to the test. Suppose, then, that a diamond could be crystallized in the midst of a cushion of soft cotton, and should remain there until it was finally burned up. Would it be false to say that that diamond was soft? This seems a foolish question, and would be so, in fact, except in the realm of logic. There such questions are often of the greatest utility as serving to bring logical principles into sharper relief than real discussions ever could. In studying logic we must not put them aside with hasty answers, but must consider them with attentive care, in order to make out the principles involved. We may, in the present case, modify our question, and ask what prevents us from saying that all hard bodies remain perfectly soft until they are touched, when their hardness increases with the pressure until they are scratched. Reflection will show that the reply is this: there would be no *falsity* in such modes of speech. They would involve a modification of our present usage of speech with regard to the words hard and soft, but not of their meanings. For they represent no fact to be different from what it is; only they involve arrangements of facts which would be exceedingly maladroit. This leads us to remark that the question of what would occur under circumstances which do not actually arise is not a question of fact, but only of the most perspicuous arrangement of them. For example, the question of free-will and fate in its simplest form, stripped of verbiage, is something like this: I have done something of which I am ashamed; could I, by an effort of the will, have resisted the temptation, and done otherwise? The philosophical reply is, that this is not a question of fact, but only of the arrangement of facts. Arranging them so as to exhibit what is particularly pertinent to my question – namely, that I ought to blame myself for having done wrong – it is perfectly true to say that, if I had willed to do otherwise than I did, I should have done otherwise. On the other hand, arranging the facts so as to exhibit another important consideration, it is equally true that, when a temptation has once been allowed to work, it will, if it has a certain force, produce its effect, let me struggle how I may. There is no objection to a contradiction in what would result from a false supposition. The *reductio ad absurdum* consists in showing that contradictory results would follow from a hypothesis which is consequently judged to be false. Many questions are involved in the free-will discussion, and I am far from desiring to say that both sides are equally right. On the contrary, I am of opinion that one side denies important facts, and that the other does not. But what I do say is, that the above single question was the origin of the whole

doubt; that, had it not been for this question, the controversy would never have arisen; and that this question is perfectly solved in the manner which I have indicated.

Let us next seek a clear idea of Weight. This is another very easy case. To say that a body is heavy means simply that, in the absence of opposing force, it will fall. This (neglecting certain specifications of how it will fall, etc., which exist in the mind of the physicist who uses the word) is evidently the whole conception of weight. It is a fair question whether some particular facts may not *account* for gravity; but what we mean by the force itself is completely involved in its effects.

This leads us to undertake an account of the idea of Force in general. This is the great conception which, developed in the early part of the seventeenth century from the rude idea of a cause, and constantly improved upon since, has shown us how to explain all the changes of motion which bodies experience, and how to think about all physical phenomena; which has given birth to modern science, and changed the face of the globe; and which, aside from its more special uses, has played a principal part in directing the course of modern thought, and in furthering modern social development. It is, therefore, worth some pains to comprehend it. According to our rule, we must begin by asking what is the immediate use of thinking about force; and the answer is, that we thus account for changes of motion. If bodies were left to themselves, without the intervention of forces, every motion would continue unchanged both in velocity and in direction. Furthermore, change of motion never takes place abruptly; if its direction is changed, it is always through a curve without angles; if its velocity alters, it is by degrees. The gradual changes which are constantly taking place are conceived by geometers to be compounded together according to the rules of the parallelogram of forces. If the reader does not already know what this is, he will find it, I hope, to his advantage to endeavor to follow the following explanation; but if mathematics are insupportable to him, pray let him skip three paragraphs rather than that we should part company here.

A *path* is a line whose beginning and end are distinguished. Two paths are considered to be equivalent, which, beginning at the same point, lead to the same point. Thus the two paths, *ABCDE* and *AFGHE*, are equivalent (Fig. 3). Paths which do *not* begin at the same point are considered to be equivalent, provided that, on moving either of them without turning it, but keeping it always parallel to its original position, when its beginning coincides with that of the other path, the ends also coincide. Paths are considered as geometrically added together, when one begins

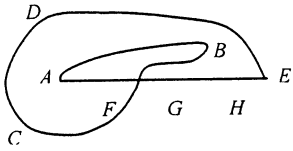

Figure 3

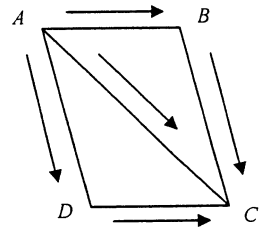

Figure 4

where the other ends; thus the path *AE* is conceived to be a sum of *AB*, *BC*, *CD*, and *DE*. In the parallelogram of Fig. 4 the diagonal *AC* is the sum of *AB* and *BC*; or, since *AD* is geometrically equivalent to *BC*, *AC* is the geometrical sum of *AB* and *AD*.

All this is purely conventional. It simply amounts to this: that we choose to call paths having the relations I have described equal or added. But, though it is a convention, it is a convention with a good reason. The rule for geometrical addition may be applied not only to paths, but to any other things which can be represented by paths. Now, as a path is determined by the varying direction and distance of the point which moves over it from the starting-point, it follows that anything which from its beginning to its end is determined by a varying direction and a varying magnitude is capable of being represented by a line. Accordingly, *velocities* may be represented by lines, for they have only directions and rates. The same thing is true of *accelerations*, or changes of velocities. This is evident enough in the case of velocities; and it becomes evident for accelerations if we consider that precisely what velocities are to positions – namely, states of change of them – that accelerations are to velocities.

The so-called "parallelogram of forces" is simply a rule for compounding accelerations. The rule is, to represent the accelerations by paths, and then to geometrically add the paths. The geometers, however, not only use the "parallelogram of forces" to compound different accelerations, but also to resolve one acceleration into a sum of several. Let *AB* (Fig. 5) be the path which represents a certain acceleration – say, such a change in the motion of a

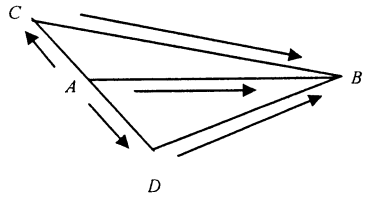

Figure 5

body that at the end of one second the body will, under the influence of that change, be in a position different from what it would have had if its motion had continued unchanged such that a path equivalent to *AB* would lead from the latter position to the former. This acceleration may be considered as the sum of the accelerations represented by *AC* and *CB*. It may also be considered as the sum of the very different accelerations represented by *AD* and *DB*, where *AD* is almost the opposite of *AC*. And it is clear that there is an immense variety of ways in which *AB* might be resolved into the sum of two accelerations.

After this tedious explanation, which I hope, in view of the extraordinary interest of the conception of force, may not have exhausted the reader's patience, we are prepared at last to state the grand fact which this conception embodies. This fact is that if the actual changes of motion which the different particles of bodies experience are each resolved in its appropriate way, each component acceleration is precisely such as is prescribed by a certain law of Nature, according to which bodies in the relative positions which the bodies in question actually have at the moment,[1] always receive certain accelerations, which, being compounded by geometrical addition, give the acceleration which the body actually experiences.

This is the only fact which the idea of force represents, and whoever will take the trouble clearly to apprehend what this fact is, perfectly comprehends what force is. Whether we ought to say that a force *is* an acceleration, or that it *causes* an acceleration, is a mere question of propriety of language, which has no more to do with our real meaning than the difference between the French idiom "*Il fait froid*" and its English equivalent "*It is cold.*" Yet it is surprising to see how this simple affair has muddled men's minds. In how many profound treatises is not force spoken of as a "mysterious entity," which seems to be only a way of confessing that the author despairs of ever getting a clear notion of what the word means! In a recent admired work on "Analytic Mechanics" it is stated that we understand precisely the effect of force, but what force itself is we do not understand! This is simply a self-contradiction. The idea which the word force excites in our minds has no other function than to affect our actions, and these actions can have no reference to force otherwise than through its effects. Consequently, if we know what the effects of force are, we are acquainted with every fact which is implied in saying that a force exists, and there is nothing more to know. The truth is, there is some vague notion afloat that a question may mean something which the mind cannot conceive; and when some hair-splitting philosophers have been confronted with the absurdity of such a view, they have invented an empty distinction between positive and negative conceptions,

[1] Possibly the velocities also have to be taken into account.

in the attempt to give their non-idea a form not obviously nonsensical. The nullity of it is sufficiently plain from the considerations given a few pages back; and, apart from those considerations, the quibbling character of the distinction must have struck every mind accustomed to real thinking.

IV

Let us now approach the subject of logic, and consider a conception which particularly concerns it, that of *reality*. Taking clearness in the sense of familiarity, no idea could be clearer than this. Every child uses it with perfect confidence, never dreaming that he does not understand it. As for clearness in its second grade, however, it would probably puzzle most men, even among those of a reflective turn of mind, to give an abstract definition of the real. Yet such a definition may perhaps be reached by considering the points of difference between reality and its opposite, fiction. A figment is a product of somebody's imagination; it has such characters as his thought impresses upon it. That those characters are independent of how you or I think is an external reality. There are, however, phenomena within our own minds, dependent upon our thought, which are at the same time real in the sense that we really think them. But though their characters depend on how we think, they do not depend on what we think those characters to be. Thus, a dream has a real existence as a mental phenomenon, if somebody has really dreamt it; that he dreamt so and so, does not depend on what anybody thinks was dreamt, but is completely independent of all opinion on the subject. On the other hand, considering, not the fact of dreaming, but the thing dreamt, it retains its peculiarities by virtue of no other fact than that it was dreamt to possess them. Thus we may define the real as that whose characters are independent of what anybody may think them to be.

But, however satisfactory such a definition may be found, it would be a great mistake to suppose that it makes the idea of reality perfectly clear. Here, then, let us apply our rules. According to them, reality, like every other quality, consists in the peculiar sensible effects which things partaking of it produce. The only effect which real things have is to cause belief, for all the sensations which they excite emerge into consciousness in the form of beliefs. The question therefore is, how is true belief (or belief in the real) distinguished from false belief (or belief in fiction). Now, as we have seen in the former paper, the ideas of truth and falsehood, in their full development, appertain exclusively to the scientific method of settling opinion. A person who arbitrarily chooses the propositions which he will adopt can use the word truth only to emphasize the expression of his determination to hold on to his choice. Of course, the method of tenacity never prevailed exclusively; reason is too natural to men for that. But in the literature of the dark ages we find some fine examples of it. When Scotus Erigena is commenting upon a poetical

passage in which hellebore is spoken of as having caused the death of Socrates, he does not hesitate to inform the inquiring reader that Helleborus and Socrates were two eminent Greek philosophers, and that the latter having been overcome in argument by the former took the matter to heart and died of it! What sort of an idea of truth could a man have who could adopt and teach, without the qualification of a perhaps, an opinion taken so entirely at random? The real spirit of Socrates, who I hope would have been delighted to have been "overcome in argument," because he would have learned something by it, is in curious contrast with the naive idea of the glossist, for whom discussion would seem to have been simply a struggle. When philosophy began to awake from its long slumber, and before theology completely dominated it, the practice seems to have been for each professor to seize upon any philosophical position he found unoccupied and which seemed a strong one, to intrench himself in it, and to sally forth from time to time to give battle to the others. Thus, even the scanty records we possess of those disputes enable us to make out a dozen or more opinions held by different teachers at one time concerning the question of nominalism and realism. Read the opening part of the "Historia Calamitatum" of Abelard, who was certainly as philosophical as any of his contemporaries, and see the spirit of combat which it breathes. For him, the truth is simply his particular stronghold. When the method of authority prevailed, the truth meant little more than the Catholic faith. All the efforts of the scholastic doctors are directed toward harmonizing their faith in Aristotle and their faith in the Church, and one may search their ponderous folios through without finding an argument which goes any further. It is noticeable that where different faiths flourish side by side, renegades are looked upon with contempt even by the party whose belief they adopt; so completely has the idea of loyalty replaced that of truth-seeking. Since the time of Descartes, the defect in the conception of truth has been less apparent. Still, it will sometimes strike a scientific man that the philosophers have been less intent on finding out what the facts are, than on inquiring what belief is most in harmony with their system. It is hard to convince a follower of the *a priori* method by adducing facts; but show him that an opinion he is defending is inconsistent with what he has laid down elsewhere, and he will be very apt to retract it. These minds do not seem to believe that disputation is ever to cease; they seem to think that the opinion which is natural for one man is not so for another, and that belief will, consequently, never be settled. In contenting themselves with fixing their own opinions by a method which would lead another man to a different result, they betray their feeble hold of the conception of what truth is.

On the other hand, all the followers of science are fully persuaded that the processes of investigation, if only pushed far enough, will give one certain solution to every question to which they can be applied. One man may investigate the velocity of light by studying the transits of Venus and the aberration of the stars; another by the oppositions of Mars and the eclipses of Jupiter's

satellites; a third by the method of Fizeau; a fourth by that of Foucault; a fifth by the motions of the curves of Lissajous; a sixth, a seventh, an eighth, and a ninth, may follow the different methods of comparing the measures of statical and dynamical electricity. They may at first obtain different results, but, as each perfects his method and his processes, the results will move steadily together toward a destined centre. So with all scientific research. Different minds may set out with the most antagonistic views, but the progress of investigation carries them by a force outside of themselves to one and the same conclusion. This activity of thought by which we are carried, not where we wish, but to a foreordained goal, is like the operation of destiny. No modification of the point of view taken, no selection of other facts for study, no natural bent of mind even, can enable a man to escape the predestinate opinion. This great law is embodied in the conception of truth and reality. The opinion which is fated[2] to be ultimately agreed to by all who investigate, is what we mean by the truth, and the object represented in this opinion is the real. That is the way I would explain reality.

But it may be said that this view is directly opposed to the abstract definition which we have given of reality, inasmuch as it makes the characters of the real depend on what is ultimately thought about them. But the answer to this is that, on the one hand, reality is independent, not necessarily of thought in general, but only of what you or I or any finite number of men may think about it; and that, on the other hand, though the object of the final opinion depends on what that opinion is, yet what that opinion is does not depend on what you or I or any man thinks. Our perversity and that of others may indefinitely postpone the settlement of opinion; it might even conceivably cause an arbitrary proposition to be universally accepted as long as the human race should last. Yet even that would not change the nature of the belief, which alone could be the result of investigation carried sufficiently far; and if, after the extinction of our race, another should arise with faculties and disposition for investigation, that true opinion must be the one which they would ultimately come to. "Truth crushed to earth shall rise again," and the opinion which would finally result from investigation does not depend on how anybody may actually think. But the reality of that which is real does depend on the real fact that investigation is destined to lead, at last, if continued long enough, to a belief in it.

But I may be asked what I have to say to all the minute facts of history, forgotten never to be recovered, to the lost books of the ancients, to the buried secrets.

[2] Fate means merely that which is sure to come true, and can nohow be avoided. It is a superstition to suppose that a certain sort of events are ever fated, and it is another to suppose that the word fate can never be freed from its superstitious taint. We are all fated to die.

"Full many a gem of purest ray serene
The dark, unfathomed caves of ocean bear;
Full many a flower is born to blush unseen,
And waste its sweetness on the desert air."

Do these things not really exist because they are hopelessly beyond the reach of our knowledge? And then, after the universe is dead (according to the prediction of some scientists), and all life has ceased forever, will not the shock of atoms continue though there will be no mind to know it? To this I reply that, though in no possible state of knowledge can any number be great enough to express the relation between the amount of what rests unknown to the amount of the known, yet it is unphilosophical to suppose that, with regard to any given question (which has any clear meaning), investigation would not bring forth a solution of it, if it were carried far enough. Who would have said, a few years ago, that we could ever know of what substances stars are made whose light may have been longer in reaching us than the human race has existed? Who can be sure of what we shall not know in a few hundred years? Who can guess what would be the result of continuing the pursuit of science for ten thousand years, with the activity of the last hundred? And if it were to go on for a million, or a billion, or any number of years you please, how is it possible to say that there is any question which might not ultimately be solved?

But it may be objected, "Why make so much of these remote considerations, especially when it is your principle that only practical distinctions have a meaning?" Well, I must confess that it makes very little difference whether we say that a stone on the bottom of the ocean, in complete darkness, is brilliant or not – that is to say, that it *probably* makes no difference, remembering always that that stone *may* be fished up to-morrow. But that there are gems at the bottom of the sea, flowers in the untraveled desert, etc., are propositions which, like that about a diamond being hard when it is not pressed, concern much more the arrangement of our language than they do the meaning of our ideas.

It seems to me, however, that we have, by the application of our rule, reached so clear an apprehension of what we mean by reality, and of the fact which the idea rests on, that we should not, perhaps, be making a pretension so presumptuous as it would be singular, if we were to offer a metaphysical theory of existence for universal acceptance among those who employ the scientific method of fixing belief. However, as metaphysics is a subject much more curious than useful, the knowledge of which, like that of a sunken reef, serves chiefly to enable us to keep clear of it, I will not trouble the reader with any more Ontology at this moment. I have already been led much further into that path than I should have desired; and I have given the reader such a dose of mathematics, psychology, and all that is most abstruse, that I fear he may

already have left me, and that what I am now writing is for the compositor and proof-reader exclusively. I trusted to the importance of the subject. There is no royal road to logic, and really valuable ideas can only be had at the price of close attention. But I know that in the matter of ideas the public prefer the cheap and nasty; and in my next paper I am going to return to the easily intelligible, and not wander from it again. The reader who has been at the pains of wading through this month's paper, shall be rewarded in the next one by seeing how beautifully what has been developed in this tedious way can be applied to the ascertainment of the rules of scientific reasoning.

We have, hitherto, not crossed the threshold of scientific logic. It is certainly important to know how to make our ideas clear, but they may be ever so clear without being true. How to make them so, we have next to study. How to give birth to those vital and procreative ideas which multiply into a thousand forms and diffuse themselves everywhere, advancing civilization and making the dignity of man, is an art not yet reduced to rules, but of the secret of which the history of science affords some hints.

THE LAW OF MIND

Charles S. Peirce. "The Law of Mind." *The Monist* 2.3 (July 1892): 533–559.

In an article published in *The Monist* for January 1891, I endeavored to show what ideas ought to form the warp of a system of philosophy, and particularly emphasised that of absolute chance. In the number of April 1892, I argued further in favor of that way of thinking, which it will be convenient to christen *tychism* (from τύχη, chance). A serious student of philosophy will be in no haste to accept or reject this doctrine; but he will see in it one of the chief attitudes which speculative thought may take, feeling that it is not for an individual, nor for an age, to pronounce upon a fundamental question of philosophy. That is a task for a whole era to work out. I have begun by showing that *tychism* must give birth to an evolutionary cosmology, in which all the regularities of nature and of mind are regarded as products of growth, and to a Schelling-fashioned idealism which holds matter to be mere specialised and partially deadened mind. I may mention, for the benefit of those who are curious in studying mental biographies, that I was born and reared in the neighborhood of Concord, – I mean in Cambridge, – at the time when Emerson, Hedge, and their friends were disseminating the ideas that they had caught from Schelling, and Schelling from Plotinus, from Boehm, or from God knows what minds stricken with the monstrous mysticism of the East. But the atmosphere of Cambridge held many an antiseptic against Concord transcendentalism; and I am not conscious of having contracted any of that virus. Nevertheless, it is probable that some cultured bacilli, some benignant form of the disease was implanted in my soul, unawares, and that now, after long incubation, it comes to the surface, modified by mathematical conceptions and by training in physical investigations.

The next step in the study of cosmology must be to examine the general law of mental action. In doing this, I shall for the time drop my tychism out of view, in order to allow a free and independent expansion to another conception signalised in my first *Monist*-paper as one of the most indispensable to philosophy, though it was not there dwelt upon; I mean the idea of continuity The tendency to regard continuity, in the sense in which I shall define it, as an idea of prime importance in philosophy may conveniently be termed *synechism*. The present paper is intended chiefly to show what synechism is, and what it leads to. I attempted, a good many years ago, to develop this doctrine in the *Journal of Speculative Philosophy* (Vol. II); but

I am able now to improve upon that exposition, in which I was a little blinded by nominalistic prepossessions. I refer to it, because students may possibly find that some points not sufficiently explained in the present paper are cleared up in those earlier ones.

What the Law Is.

Logical analysis applied to mental phenomena shows that there is but one law of mind, namely, that ideas tend to spread continuously and to affect certain others which stand to them in a peculiar relation of affectibility. In this spreading they lose intensity, and especially the power of affecting others, but gain generality and become welded with other ideas.

I set down this formula at the beginning, for convenience; and now proceed to comment upon it.

Individuality of Ideas.

We are accustomed to speak of ideas as reproduced, as passed from mind to mind, as similar or dissimilar to one another, and, in short, as if they were substantial things; nor can any reasonable objection be raised to such expressions. But taking the word "idea" in the sense of an event in an individual consciousness, it is clear that an idea once past is gone forever, and any supposed recurrence of it is another idea. These two ideas are not present in the same state of consciousness, and therefore cannot possibly be compared. To say, therefore, that they are similar can only mean that an occult power from the depths of the soul forces us to connect them in our thoughts after they are both no more. We may note, here, in passing that of the two generally recognised principles of association, contiguity and similarity, the former is a connection due to a power without, the latter a connection due to a power within.

But what can it mean to say that ideas wholly past are thought of at all, any longer? They are utterly unknowable. What distinct meaning can attach to saying that an idea in the past in any way affects an idea in the future, from which it is completely detached? A phrase between the assertion and the denial of which there can in no case be any sensible difference is mere gibberish.

I will not dwell further upon this point, because it is a commonplace of philosophy.

Continuity of Ideas.

We have here before us a question of difficulty, analogous to the question of nominalism and realism. But when once it has been clearly formulated, logic leaves room for one answer only. How can a past idea be present? Can it be

present vicariously? To a certain extent, perhaps; but not merely so; for then the question would arise how the past idea can be related to its vicarious representation. The relation, being between ideas, can only exist in some consciousness: now that past idea was in no consciousness but that past consciousness that alone contained it; and that did not embrace the vicarious idea.

Some minds will here jump to the conclusion that a past idea cannot in any sense be present. But that is hasty and illogical. How extravagant, too, to pronounce our whole knowledge of the past to be mere delusion! Yet it would seem that the past is as completely beyond the bounds of possible experience as a Kantian thing-in-itself.

How can a past idea be present? Not vicariously. Then, only by direct perception. In other words, to be present, it must be *ipso facto* present. That is, it cannot be wholly past; it can only be going, infinitesimally past, less past than any assignable past date. We are thus brought to the conclusion that the present is connected with the past by a series of real infinitesimal steps.

It has already been suggested by psychologists that consciousness necessarily embraces an interval of time. But if a finite time be meant, the opinion is not tenable. If the sensation that precedes the present by half a second were still immediately before me, then, on the same principle the sensation preceding that would be immediately present, and so on *ad infinitum*. Now, since there is a time, say a year, at the end of which an idea is no longer *ipso facto* present, it follows that this is true of any finite interval, however short.

But yet consciousness must essentially cover an interval of time; for if it did not, we could gain no knowledge of time, and not merely no veracious cognition of it, but no conception whatever. We are, therefore, forced to say that we are immediately conscious through an infinitesimal interval of time.

This is all that is requisite. For, in this infinitesimal interval, not only is consciousness continuous in a subjective sense, that is, considered as a subject or substance having the attribute of duration; but also, because it is immediate consciousness, its object is *ipso facto* continuous. In fact, this infinitesimally spread-out consciousness is a direct feeling of its contents as spread out. This will be further elucidated below. In an infinitesimal interval we directly perceive the temporal sequence of its beginning, middle, and end, – not, of course, in the way of recognition, for recognition is only of the past, but in the way of immediate feeling. Now upon this interval follows another, whose beginning is the middle of the former, and whose middle is the end of the former. Here, we have an immediate perception of the temporal sequence of its beginning, middle, and end, or say of the second, third, and fourth instants. From these two immediate perceptions, we gain a mediate, or inferential, perception of the relation of all four instants. This mediate perception is objectively, or as to the object represented, spread over the four instants; but subjectively, or as itself the subject of duration, it is completely embraced in

the second moment. [The reader will observe that I use the word *instant* to mean a point of time, and *moment* to mean an infinitesimal duration.] If it is objected that, upon the theory proposed, we must have more than a mediate perception of the succession of the four instants, I grant it; for the sum of the two infinitesimal intervals is itself infinitesimal, so that it is immediately perceived. It is immediately perceived in the whole interval, but only mediately perceived in the last two thirds of the interval. Now, let there be an indefinite succession of these inferential acts of comparative perception; and it is plain that the last moment will contain objectively the whole series. Let there be, not merely an indefinite succession, but a continuous flow of inference through a finite time; and the result will be a mediate objective consciousness of the whole time in the last moment. In this last moment, the whole series will be recognised, or known as known before, except only the last moment, which of course will be absolutely unrecognisable to itself. Indeed, even this last moment will be recognised like the rest, or, at least, be just beginning to be so. There is a little *elenchus*, or appearance of contradiction, here, which the ordinary logic of reflection quite suffices to resolve.

Infinity and Continuity, in General.

Most of the mathematicians who during the last two generations have treated the differential calculus have been of the opinion that an infinitesimal quantity is an absurdity; although, with their habitual caution, they have often added "or, at any rate, the conception of an infinitesimal is so difficult, that we practically cannot reason about it with confidence and security." Accordingly, the doctrine of limits has been invented to evade the difficulty, or, as some say, to explain the signification of the word "infinitesimal." This doctrine, in one form or another, is taught in all the textbooks, though in some of them only as an alternative view of the matter; it answers well enough the purposes of calculation, though even in that application it has its difficulties.

The illumination of the subject by a strict notation for the logic of relatives had shown me clearly and evidently that the idea of an infinitesimal involves no contradiction, before I became acquainted with the writings of Dr. Georg Cantor (though many of these had already appeared in the *Mathematische Annalen* and in *Borchardt's Journal*, if not yet in the *Acta Mathematica*, all mathematical journals of the first distinction), in which the same view is defended with extraordinary genius and penetrating logic.

The prevalent opinion is that finite numbers are the only ones that we can reason about, at least, in any ordinary mode of reasoning, or, as some authors express it, they are the only numbers that can be reasoned about mathematically. But this is an irrational prejudice. I long ago showed that finite collections are distinguished from infinite ones only by one circumstance and its consequences, namely that to them is applicable a peculiar and unusual

mode of reasoning called by its discoverer, De Morgan, the "syllogism of transposed quantity."

Balzac, in the introduction of his *Physiologie du mariage*, remarks that every young Frenchman boasts of having seduced some Frenchwoman. Now, as a woman can only be seduced once, and there are no more Frenchwomen than Frenchmen, it follows, if these boasts are true, that no Frenchwomen escape seduction. If their number be finite, the reasoning holds. But since the population is continually increasing, and the seduced are on the average younger than the seducers, the conclusion need not be true. In like manner, De Morgan, as an actuary, might have argued that if an insurance company pays to its insured on an average more than they have ever paid it, including interest, it must lose money. But every modern actuary would see a fallacy in that, since the business is continually on the increase. But should war, or other cataclysm, cause the class of insured to be a finite one, the conclusion would turn out painfully correct, after all. The above two reasonings are examples of the syllogism of transposed quantity.

The proposition that finite and infinite collections are distinguished by the applicability to the former of the syllogism of transposed quantity ought to be regarded as the basal one of scientific arithmetic.

If a person does not know how to reason logically, and I must say that a great many fairly good mathematicians, – yea distinguished ones, – fall under this category, but simply uses a rule of thumb in blindly drawing inferences like other inferences that have turned out well, he will, of course, be continually falling into error about infinite numbers. The truth is such people do not reason, at all. But for the few who do reason, reasoning about infinite numbers is easier than about finite numbers, because the complicated syllogism of transposed quantity is not called for. For example, that the whole is greater than its part is not an axiom, as that eminently bad reasoner, Euclid, made it to be. It is a theorem readily proved by means of a syllogism of transposed quantity, but not otherwise. Of finite collections it is true, of infinite collections false. Thus, a part of the whole numbers are even numbers. Yet the even numbers are no fewer than all the numbers; an evident proposition since if every number in the whole series of whole numbers be doubled, the result will be the series of even numbers.

1, 2, 3, 4, 5, 6, etc.
2, 4, 6, 8, 10, 12, etc.

So for every number there is a distinct even number. In fact, there are as many distinct doubles of numbers as there are of distinct numbers. But the doubles of numbers are all even numbers.

In truth, of infinite collections there are but two grades of magnitude, the *endless* and the *innumerable*. Just as a finite collection is distinguished from

an infinite one by the applicability to it of a special mode of reasoning, the syllogism of transposed quantity, so, as I showed in the paper last referred to, a numerable collection is distinguished from an innumerable one by the applicability to it of a certain mode of reasoning, the Fermatian inference, or, as it is sometimes improperly termed, "mathematical induction."

As an example of this reasoning, Euler's demonstration of the binomial theorem for integral powers may be given. The theorem is that $(x + y)^n$, where n is a whole number, may be expanded into the sum of a series of terms of which the first is $x^n y^0$ and each of the others is derived from the next preceding by diminishing the exponent of x by 1 and multiplying by that exponent and at the same time increasing the exponent of y by 1 and dividing by that increased exponent. Now, suppose this proposition to be true for a certain exponent, $n = M$, then it must also be true for $n = M + 1$. For let one of the terms in the expansion of $(x + y)^M$ be written $Ax^p y^q$. Then, this term with the two following will be

$$Ax^p y^q + A(p / (q + 1))x^{p-1}y^{q+1} + A(p / (q + 1))((\mathrm{p} - 1) / (q + 2))x^{p-2}y^{q+2}$$

Now, when $(x + y)^M$ is multiplied by $x + y$ to give $(x + y)^{M+1}$, we multiply first by x and then by y instead of by x and add the two results. When we multiply by x, the second of the above three terms will be the only one giving a term involving $x^p y^{q+1}$ and the third will be the only one giving a term in $x^{p-1}y^{q+2}$; and when we multiply by y the first will be the only term giving a term in $x^p y^{q+1}$, and the second will be the only term giving a term in $x^{p-1}y^{q+2}$. Hence, adding like terms, we find that the coefficient of $x^p y^{q+1}$ in the expansion of $(x + y)^{M+1}$ will be the sum of the coefficients of the first two of the above three terms, and that the coefficient of $x^{p-1}y^{q+2}$ will be the sum of the coefficients of the last two terms. Hence, two successive terms in the expansion of $(x + y)^{M+1}$ will be

$$A(1 + (p / (q + 1)))x^p y^{q+1} + A(p / (q + 1))(1+((\mathrm{p} - 1) / (q + 2)))x^{p-1}y^{q+2}$$
$$= A((p + q + 1) / (q + 1))x^p y^{q+1} + A((p + q + 1) / (q + 1))(p / (q + 2))x^{p-1}y^{q+2}.$$

It is thus seen that the succession of terms follows the rule. Thus if any integral power follows the rule, so also does the next higher power. But the first power obviously follows the rule. Hence, all powers do so.

Such reasoning holds good of any collection of objects capable of being ranged in a series which, though it may be endless, can be numbered so that each member of it receives a definite integral number. For instance, all the whole numbers constitute such a numerable collection. Again, all numbers resulting from operating according to any definite rule with any finite number of whole numbers form such a collection. For they may be arranged in a series thus. Let F be the symbol of operation. First operate on 1, giving F(1). Then, operate on a second 1, giving F(1,1). Next, introduce 2, giving 3rd, F(2); 4th,

F(2,1); 5th, F(1,2); 6th, F(2,2). Next use a third variable giving 7th, F(1,1,1); 8th, F(2,1,1); 9th, F(1,2,1); 10th, F(2,2,1); 11th, F(1,1,2); 12th, F(2,1,2); 13th, F(1,2,2); 14th, F(2,2,2). Next introduce 3, and so on, alternately introducing new variables and new figures; and in this way it is plain that every arrangement of integral values of the variables will receive a numbered place in the series.[1]

The class of endless but numerable collections (so called because they can be so ranged that to each one corresponds a distinct whole number) is very large. But there are collections which are certainly innumerable. Such is the collection of all numbers to which endless series of decimals are capable of approximating. It has been recognised since the time of Euclid that certain numbers are surd or incommensurable, and are not exactly expressible by any finite series of decimals, nor by a circulating decimal. Such is the ratio of the circumference of a circle to its diameter, which we know is nearly 3.1415926. The calculation of this number has been carried to over 700 figures without the slightest appearance of regularity in their sequence. The demonstrations that this and many other numbers are incommensurable are perfect. That the entire collection of incommensurable numbers is innumerable has been clearly proved by Cantor. I omit the demonstration; but it is easy to see that to discriminate one from some other would, in general, require the use of an endless series of numbers. Now if they cannot be exactly expressed and discriminated, clearly they cannot be ranged in a linear series.

It is evident that there are as many points on a line or in an interval of time as there are of real numbers, in all. These are, therefore, innumerable collections. Many mathematicians have incautiously assumed that the points on a surface or in a solid are more than those on a line. But this has been refuted by Cantor. Indeed, it is obvious that for every set of values of coördinates there is a single distinct number. Suppose, for instance, the values of the coördinates all lie between 0 and +1. Then if we compose a number by putting in the first decimal place the first figure of the first coördinate, in the second the first figure of the second coördinate, and so on, and when the first figures are all dealt out go on to the second figures in like manner, it is plain that the values of the coördinates can be read off from the single resulting number, so that a triad or tetrad of numbers, each having innumerable values, has no more values than a single incommensurable number.

Were the number of dimensions infinite, this would fail; and the collection of infinite sets of numbers, having each innumerable variations, might, therefore, be greater than the simple innumerable collection, and might be called *endlessly infinite*. The single individuals of such a collection could not,

[1] This proposition is substantially the same as a theorem of Cantor, though it is enunciated in a much more general form.

however, be designated, even approximately, so that this is indeed a magnitude concerning which it would be possible to reason only in the most general way, if at all.

Although there are but two grades of magnitudes of infinite collections, yet when certain conditions are imposed upon the order in which individuals are taken, distinctions of magnitude arise from that cause. Thus, if a simply endless series be doubled by separating each unit into two parts, the successive first parts and also the second parts being taken in the same order as the units from which they are derived, this double endless series will, so long as it is taken in that order, appear as twice as large as the original series. In like manner the product of two innumerable collections, that is, the collection of possible pairs composed of one individual of each, if the order of continuity is to be maintained, is, by virtue of that order, infinitely greater than either of the component collections.

We now come to the difficult question, What is continuity? Kant confounds it with infinite divisibility, saying that the essential character of a continuous series is that between any two members of it a third can always be found. This is an analysis beautifully clear and definite; but, unfortunately, it breaks down under the first test. For according to this, the entire series of rational fractions arranged in the order of their magnitude, would be an infinite series, although the rational fractions are numerable, while the points of a line are innumerable. Nay, worse yet, if from that series of fractions any two with all that lie between them be excised, and any number of such finite gaps be made, Kant's definition is still true of the series, though it has lost all appearance of continuity.

Cantor defines a continuous series as one which is *concatenated* and *perfect*. By a concatenated series, he means such a one that if any two points are given in it, and any finite distance, however small, it is possible to proceed from the first point to the second through a succession of points of the series each at a distance from the preceding one less than the given distance. This is true of the series of rational fractions ranged in the order of their magnitude. By a perfect series, he means one which contains every point such that there is no distance so small that this point has not an infinity of points of the series within that distance of it. This is true of the series of numbers between 0 and 1 capable of being expressed by decimals in which only the digits 0 and 1 occur.

It must be granted that Cantor's definition includes every series that is continuous; nor can it be objected that it includes any important or indubitable case of a series not continuous. Nevertheless, it has some serious defects. In the first place, it turns upon metrical considerations; while the distinction between a continuous and a discontinuous series is manifestly non-metrical. In the next place, a perfect series is defined as one containing "every point" of a certain description. But no positive idea is conveyed of what all

the points are: that is definition by negation, and cannot be admitted. If that sort of thing were allowed, it would be very easy to say, at once, that the continuous linear series of points is one which contains every point of the line between its extremities. Finally, Cantor's definition does not convey a distinct notion of what the components of the conception of continuity are. It ingeniously wraps up its properties in two separate parcels, but does not display them to our intelligence.

Kant's definition expresses one simple property of a continuum; but it allows of gaps in the series. To mend the definition, it is only necessary to notice how these gaps can occur. Let us suppose, then, a linear series of points extending from a point, *A*, to a point, *B*, having a gap from *B* to a third point, *C*, and thence extending to a final limit, *D*; and let us suppose this series conforms to Kant's definition. Then, of the two points, *B* and *C*, one or both must be excluded from the series; for otherwise, by the definition, there would be points between them. That is, if the series contains *C*, though it contains all the points up to *B*, it cannot contain *B*. What is required, therefore, is to state in non-metrical terms that if a series of points up to a limit is included in a continuum the limit is included. It may be remarked that this is the property of a continuum to which Aristotle's attention seems to have been directed when he defines a continuum as something whose parts have a common limit. The property may be exactly stated as follows: If a linear series of points is continuous between two points, *A* and *D*, and if an endless series of points be taken, the first of them between *A* and *D* and each of the others between the last preceding one and *D*, then there is a point of the continuous series between all that endless series of points and *D*, and such that every other point of which this is true lies between this point and *D*. For example, take any number between 0 and 1, as 0.1; then, any number between 0.1 and 1, as 0.11; then any number between 0.11 and 1, as 0.111; and so on, without end. Then, because the series of real numbers between 0 and 1 is continuous, there must be a *least* real number, greater than every number of that endless series. This property, which may be called the Aristotelicity of the series, together with Kant's property, or its Kanticity, completes the definition of a continuous series.

The property of Aristotelicity may be roughly stated thus: a continuum contains the end point belonging to every endless series of points which it contains. An obvious corollary is that every continuum contains its limits. But in using this principle it is necessary to observe that a series may be continuous except in this, that it omits one or both of the limits.

Our ideas will find expression more conveniently if, instead of points upon a line, we speak of real numbers. Every real number is, in one sense, the limit of a series, for it can be indefinitely approximated to. Whether every real number is a limit of a *regular* series may perhaps be open to doubt. But the series referred to in the definition of Aristotelicity must be understood as

including all series whether regular or not. Consequently, it is implied that between any two points an innumerable series of points can be taken.

Every number whose expression in decimals requires but a finite number of places of decimals is commensurable. Therefore, incommensurable numbers suppose an infinitieth place of decimals. The word infinitesimal is simply the Latin form of infinitieth; that is, it is an ordinal formed from *infinitum*, as centesimal from *centum*. Thus, continuity supposes infinitesimal quantities. There is nothing contradictory about the idea of such quantities. In adding and multiplying them the continuity must not be broken up, and consequently they are precisely like any other quantities, except that neither the syllogism of transposed quantity, nor the Fermatian inference applies to them.

If A is a finite quantity and i an infinitesimal, then in a certain sense we may write $A + i = A$. That is to say, this is so for all purposes of measurement. But this principle must not be applied except to get rid of *all* the terms in the highest order of infinitesimals present. As a mathematician, I prefer the method of infinitesimals to that of limits, as far easier and less infested with snares. Indeed, the latter, as stated in some books, involves propositions that are false; but this is not the case with the forms of the method used by Cauchy, Duhamel, and others. As they understand the doctrine of limits, it involves the notion of continuity, and therefore contains in another shape the very same ideas as the doctrine of infinitesimals.

Let us now consider an aspect of the Aristotelical principle which is particularly important in philosophy. Suppose a surface to be part red and part blue; so that every point on it is either red or blue, and, of course, no part can be both red and blue. What, then, is the color of the boundary line between the red and the blue? The answer is that red or blue, to exist at all, must be spread over a surface; and the color of the surface is the color of the surface in the immediate neighborhood of the point. I purposely use a vague form of expression. Now, as the parts of the surface in the immediate neighborhood of any ordinary point upon a curved boundary are half of them red and half blue, it follows that the boundary is half red and half blue. In like manner, we find it necessary to hold that consciousness essentially occupies time; and what is present to the mind at any ordinary instant is what is present during a moment in which that instant occurs. Thus, the present is half past and half to come. Again, the color of the parts of a surface at any finite distance from a point, has nothing to do with its color just at that point; and, in the parallel, the feeling at any finite interval from the present has nothing to do with the present feeling, except vicariously. Take another case: the velocity of a particle at any instant of time is its mean velocity during an infinitesimal instant in which that time is contained. Just so my immediate feeling is my feeling through an infinitesimal duration containing the present instant.

Analysis of Time.

One of the most marked features about the law of mind is that it makes time to have a definite direction of flow from past to future. The relation of past to future is, in reference to the law of mind, different from the relation of future to past. This makes one of the great contrasts between the law of mind and the law of physical force, where there is no more distinction between the two opposite directions in time than between moving northward and moving southward.

In order, therefore, to analyse the law of mind, we must begin by asking what the flow of time consists in. Now, we find that in reference to any individual state of feeling, all others are of two classes, those which affect this one (or have a tendency to affect it, and what this means we shall inquire shortly), and those which do not. The present is affectible by the past but not by the future.

Moreover, if state *A* is affected by state *B*, and state *B* by state *C*, then *A* is affected by state *C*, though not so much so. It follows, that if *A* is affectible by *B*, *B* is not affectible by *A*.

If, of two states, each is absolutely unaffectible by the other, they are to be regarded as parts of the same state. They are contemporaneous.

To say that a state is *between* two states means that it affects one and is affected by the other. Between any two states in this sense lies an innumerable series of states affecting one another; and if a state lies between a given state and any other state which can be reached by inserting states between this state and any third state, these inserted states not immediately affecting or being affected by either, then the second state mentioned immediately affects or is affected by the first, in the sense that in the one the other is *ipso facto* present in a reduced degree.

These propositions involve a definition of time and of its flow. Over and above this definition they involve a doctrine, namely, that every state of feeling is affectible by every earlier state.

That Feelings Have Intensive Continuity.

Time with its continuity logically involves some other kind of continuity than its own. Time, as the universal form of change, cannot exist unless there is something to undergo change, and to undergo a change continuous in time, there must be a continuity of changeable qualities. Of the continuity of intrinsic qualities of feeling we can now form but a feeble conception. The development of the human mind has practically extinguished all feelings, except a few sporadic kinds, sound, colors, smells, warmth, etc., which now appear to be disconnected and disparate. In the case of colors, there is a tridimensional spread of feelings. Originally, all feelings may have been connected in the same way, and the presumption is that the number of dimensions was

endless. For development essentially involves a limitation of possibilities. But given a number of dimensions of feeling, all possible varieties are obtainable by varying the intensities of the different elements. Accordingly, time logically supposes a continuous range of intensity in feeling. It follows, then, from the definition of continuity, that when any particular kind of feeling is present, an infinitesimal continuum of all feelings differing infinitesimally from that is present.

That Feelings Have Spatial Extension.

Consider a gob of protoplasm, say an amoeba or a slime-mould. It does not differ in any radical way from the contents of a nerve-cell, though its functions may be less specialised. There is no doubt that this slime-mould, or this amœba, or at any rate some similar mass of protoplasm feels. That is to say, it feels when it is in its excited condition. But note how it behaves. When the whole is quiescent and rigid, a place upon it is irritated. Just at this point, an active motion is set up, and this gradually spreads to other parts. In this action, no unity nor relation to a nucleus, or other unitary organ can be discerned. It is a mere amorphous continuum of protoplasm, with feeling passing from one part to another. Nor is there anything like a wave-motion. The activity does not advance to new parts, just as fast as it leaves old parts. Rather, in the beginning, it dies out at a slower rate than that at which it spreads. And while the process is going on, by exciting the mass at another point, a second quite independent state of excitation will be set up. In some places, neither excitation will exist, in others each separately, in still other places, both effects will be added together. Whatever there is in the whole phenomenon to make us think there is feeling in such a mass of protoplasm, – *feeling*, but plainly no *personality*, – goes logically to show that that feeling has a subjective, or substantial, spatial extension, as the excited state has. This is, no doubt, a difficult idea to seize, for the reason that it is a subjective, not an objective, extension. It is not that we have a feeling of bigness; though Professor James, perhaps rightly, teaches that we have. It is that the feeling, as a subject of inhesion, is big. Moreover, our own feelings are focused in attention to such a degree that we are not aware that ideas are not brought to an absolute unity; just as nobody not instructed by special experiment has any idea how very, very little of the field of vision is distinct. Still, we all know how the attention wanders about among our feelings; and this fact shows that those feelings that are not coördinated in attention have a reciprocal externality, although they are present at the same time. But we must not tax introspection to make a phenomenon manifest which essentially involves externality.

Since space is continuous, it follows that there must be an immediate community of feeling between parts of mind infinitesimally near together.

Without this, I believe it would have been impossible for minds external to one another ever to become coördinated, and equally impossible for any coördination to be established in the action of the nerve-matter of one brain.

Affections of Ideas.

But we are met by the question what is meant by saying that one idea affects another. The unravelment of this problem requires us to trace out phenomena a little further.

Three elements go to make up an idea. The first is its intrinsic quality as a feeling. The second is the energy with which it affects other ideas, an energy which is infinite in the here-and-nowness of immediate sensation, finite and relative in the recency of the past. The third element is the tendency of an idea to bring along other ideas with it.

As an idea spreads, its power of affecting other ideas gets rapidly reduced; but its intrinsic quality remains nearly unchanged. It is long years now since I last saw a cardinal in his robes; and my memory of their color has become much dimmed. The color itself, however, is not remembered as dim. I have no inclination to call it a dull red. Thus, the intrinsic quality remains little changed; yet more accurate observation will show a slight reduction of it. The third element, on the other hand, has increased. As well as I can recollect, it seems to me the cardinals I used to see wore robes more scarlet than vermilion is, and highly luminous. Still, I know the color commonly called cardinal is on the crimson side of vermilion and of quite moderate luminosity, and the original idea calls up so many other hues with it, and asserts itself so feebly, that I am unable any longer to isolate it.

A finite interval of time generally contains an innumerable series of feelings; and when these become welded together in association, the result is a general idea. For we have just seen how by continuous spreading an idea becomes generalised.

The first character of a general idea so resulting is that it is living feeling. A continuum of this feeling, infinitesimal in duration, but still embracing innumerable parts, and also, though infinitesimal, entirely unlimited, is immediately present. And in its absence of boundedness a vague possibility of more than is present is directly felt.

Second, in the presence of this continuity of feeling, nominalistic maxims appear futile. There is no doubt about one idea affecting another, when we can directly perceive the one gradually modified and shaping itself into the other. Nor can there any longer be any difficulty about one idea resembling another, when we can pass along the continuous field of quality from one to the other and back again to the point which we had marked.

Third, consider the insistency of an idea. The insistency of a past idea with reference to the present is a quantity which is less the further back that past

idea is, and rises to infinity as the past idea is brought up into coincidence with the present. Here we must make one of those inductive applications of the law of continuity which have produced such great results in all the positive sciences. We must extend the law of insistency into the future. Plainly, the insistency of a future idea with reference to the present is a quantity affected by the minus sign; for it is the present that affects the future, if there be any effect, not the future that affects the present. Accordingly, the curve of insistency is a sort of equilateral hyperbola. [See the figure.] Such a conception is none the less mathematical, that its quantification cannot now be exactly specified.

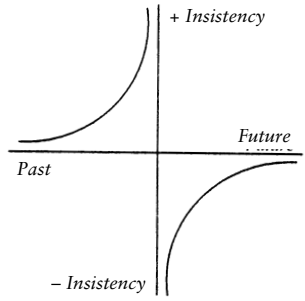

Figure 6

Now consider the induction which we have here been led into. This curve says that feeling which has not yet emerged into immediate consciousness is already affectible and already affected. In fact, this is habit, by virtue of which an idea is brought up into present consciousness by a bond that had already been established between it and another idea while it was still *in futuro*.

We can now see what the affection of one idea by another consists in. It is that the affected idea is attached as a logical predicate to the affecting idea as subject. So when a feeling emerges into immediate consciousness, it always appears as a modification of a more or less general object already in the mind. The word suggestion is well adapted to expressing this relation. The future is suggested by, or rather is influenced by the suggestions of, the past.

Ideas Cannot Be Connected Except by Continuity.

That ideas can nowise be connected without continuity is sufficiently evident to one who reflects upon the matter. But still the opinion may be entertained that after continuity has once made the connection of ideas possible, then they may get to be connected in other modes than through continuity. Certainly,

I cannot see how anyone can deny that the infinite diversity of the universe, which we call chance, may bring ideas into proximity which are not associated in one general idea. It may do this many times. But then the law of continuous spreading will produce a mental association; and this I suppose is an abridged statement of the way the universe has been evolved. But if I am asked whether a blind *ἀνάγκη* cannot bring ideas together, first I point out that it would not remain blind. There being a continuous connection between the ideas, they would infallibly become associated in a living, feeling, and perceiving general idea. Next, I cannot see what the mustness or necessity of this *ἀνάγκη* would consist in. In the absolute uniformity of the phenomenon, says the nominalist. Absolute is well put in; for if it merely happened so three times in succession, or three million times in succession, in the absence of any reason, the coincidence could only be attributed to chance. But absolute uniformity must extend over the whole infinite future; and it is idle to talk of that except as an idea. No; I think we can only hold that wherever ideas come together they tend to weld into general ideas; and wherever they are generally connected, general ideas govern the connection; and these general ideas are living feelings spread out.

Mental Law Follows the Forms of Logic.

The three main classes of logical inference are Deduction, Induction, and Hypothesis. These correspond to three chief modes of action of the human soul. In deduction the mind is under the dominion of a habit or association by virtue of which a general idea suggests in each case a corresponding reaction. But a certain sensation is seen to involve that idea. Consequently, that sensation is followed by that reaction. That is the way the hind legs of a frog, separated from the rest of the body, reason, when you pinch them. It is the lowest form of psychical manifestation.

By induction, a habit becomes established. Certain sensations, all involving one general idea, are followed each by the same reaction; and an association becomes established, whereby that general idea gets to be followed uniformly by that reaction.

Habit is that specialisation of the law of mind whereby a general idea gains the power of exciting reactions. But in order that the general idea should attain all its functionality, it is necessary, also, that it should become suggestible by sensations. That is accomplished by a psychical process having the form of hypothetic inference. By hypothetic inference, I mean, as I have explained in other writings, an induction from qualities. For example, I know that the kind of man known and classed as a "mugwump" has certain characteristics. He has a high self-respect and places great value upon social distinction. He laments the great part that rowdyism and unrefined good fellowship play in the dealings of American politicians with their constituency. He thinks that the reform which would follow from the abandonment of the system by which the distribution

of offices is made to strengthen party organisations and a return to the original and essential conception of office-filling would be found an unmixed good. He holds that monetary considerations should usually be the decisive ones in questions of public policy. He respects the principle of individualism and of *laisser-faire* as the greatest agency of civilisation. These views, among others, I know to be obtrusive marks of a "mugwump." Now, suppose I casually meet a man in a railway-train, and falling into conversation find that he holds opinions of this sort; I am naturally led to suppose that he is a "mugwump." That is hypothetic inference. That is to say, a number of readily verifiable marks of a mugwump being selected, I find this man has these, and infer that he has all the other characters which go to make a thinker of that stripe. Or let us suppose that I meet a man of a semi-clerical appearance and a sub-pharisaical sniff, who appears to look at things from the point of view of a rather wooden dualism. He cites several texts of scripture and always with particular attention to their logical implications; and he exhibits a sternness, almost amounting to vindictiveness, towards evil-doers in general. I readily conclude that he is a minister of a certain denomination. Now the mind acts in a way similar to this, every time we acquire a power of coördinating reactions in a peculiar way, as in performing any act requiring skill. Thus, most persons have a difficulty in moving the two hands simultaneously and in opposite directions through two parallel circles nearly in the medial plane of the body. To learn to do this, it is necessary to attend, first, to the different actions in different parts of the motion, when suddenly a general conception of the action springs up and it becomes perfectly easy. We think the motion we are trying to do involves this action, and this, and this. Then, the general idea comes which unites all those actions, and thereupon the desire to perform the motion calls up the general idea. The same mental process is many times employed whenever we are learning to speak a language or are acquiring any sort of skill.

Thus, by induction, a number of sensations followed by one reaction become united under one general idea followed by the same reaction; while, by the hypothetic process, a number of reactions called for by one occasion get united in a general idea which is called out by the same occasion. By deduction, the habit fulfils its function of calling out certain reactions on certain occasions.

Uncertainty of Mental Action.

The inductive and hypothetic forms of inference are essentially probable inferences, not necessary; while deduction may be either necessary or probable.

But no mental action seems to be necessary or invariable in its character. In whatever manner the mind has reacted under a given sensation, in that manner it is the more likely to react again; were this, however, an absolute

necessity, habits would become wooden and ineradicable and, no room being left for the formation of new habits, intellectual life would come to a speedy close. Thus, the uncertainty of the mental law is no mere defect of it, but is on the contrary of its essence. The truth is, the mind is not subject to "law," in the same rigid sense that matter is. It only experiences gentle forces which merely render it more likely to act in a given way than it otherwise would be. There always remains a certain amount of arbitrary spontaneity in its action, without which it would be dead.

Some psychologists think to reconcile the uncertainty of reactions with the principle of necessary causation by means of the law of fatigue. Truly for a *law*, this law of fatigue is a little lawless. I think it is merely a case of the general principle that an idea in spreading loses its insistency. Put me tarragon into my salad, when I have not tasted it for years, and I exclaim, "What nectar is this!" But add it to every dish I taste for week after week, and a habit of expectation has been created; and in thus spreading into habit, the sensation makes hardly any more impression upon me; or, if it be noticed, it is on a new side from which it appears as rather a bore. The doctrine that fatigue is one of the primordial phenomena of mind I am much disposed to doubt. It seems a somewhat little thing to be allowed as an exception to the great principle of mental uniformisation. For this reason, I prefer to explain it in the manner here indicated, as a special case of that great principle. To consider it as something distinct in its nature, certainly somewhat strengthens the necessitarian position; but even if it be distinct, the hypothesis that all the variety and apparent arbitrariness of mental action ought to be explained away in favor of absolute determinism does not seem to me to recommend itself to a sober and sound judgment, which seeks the guidance of observed facts and not that of prepossessions.

Restatement of the Law.

Let me now try to gather up all these odds and ends of commentary and restate the law of mind, in a unitary way.

First, then, we find that when we regard ideas from a nominalistic, individualistic, sensualistic way, the simplest facts of mind become utterly meaningless. That one idea should resemble another or influence another, or that one state of mind should so much as be thought of in another, is, from that standpoint, sheer nonsense.

Second, by this and other means we are driven to perceive, what is quite evident of itself, that instantaneous feelings flow together into a continuum of feeling, which has in a modified degree the peculiar vivacity of feeling and has gained generality. And in reference to such general ideas, or continua of feeling, the difficulties about resemblance and suggestion and reference to the external, cease to have any force.

Third, these general ideas are not mere words, nor do they consist in this, that certain concrete facts will every time happen under certain descriptions of conditions; but they are just as much, or rather far more, living realities than the feelings themselves out of which they are concreted. And to say that mental phenomena are governed by law does not mean merely that they are describable by a general formula; but that there is a living idea, a conscious continuum of feeling, which pervades them, and to which they are docile.

Fourth, this supreme law, which is the celestial and living harmony, does not so much as demand that the special ideas shall surrender their peculiar arbitrariness and caprice entirely; for that would be self-destructive. It only requires that they shall influence and be influenced by one another.

Fifth, in what measure this unification acts, seems to be regulated only by special rules; or, at least, we cannot in our present knowledge say how far it goes. But it may be said that, judging by appearances, the amount of arbitrariness in the phenomena of human minds is neither altogether trifling nor very prominent.

Personality.

Having thus endeavored to state the law of mind, in general, I descend to the consideration of a particular phenomenon which is remarkably prominent in our own consciousnesses, that of personality. A strong light is thrown upon this subject by recent observations of double and multiple personality. The theory which at one time seemed plausible that two persons in one body corresponded to the two halves of the brain will, I take it, now be universally acknowledged to be insufficient. But that which these cases make quite manifest is that personality is some kind of coördination or connection of ideas. Not much to say, this, perhaps. Yet when we consider that, according to the principle which we are tracing out, a connection between ideas is itself a general idea, and that a general idea is a living feeling, it is plain that we have at least taken an appreciable step toward the understanding of personality. This personality, like any general idea, is not a thing to be apprehended in an instant. It has to be lived in time; nor can any finite time embrace it in all its fullness. Yet in each infinitesimal interval it is present and living, though specially colored by the immediate feelings of that moment. Personality, so far as it is apprehended in a moment, is immediate self-consciousness.

But the word coördination implies somewhat more than this; it implies a teleological harmony in ideas, and in the case of personality this teleology is more than a mere purposive pursuit of a predeterminate end; it is a developmental teleology. This is personal character. A general idea, living and conscious now, it is already determinative of acts in the future to an extent to which it is not now conscious.

This reference to the future is an essential element of personality. Were the ends of a person already explicit, there would be no room for development, for growth, for life; and consequently there would be no personality. The mere carrying out of predetermined purposes is mechanical. This remark has an application to the philosophy of religion. It is that a genuine evolutionary philosophy, that is, one that makes the principle of growth a primordial element of the universe, is so far from being antagonistic to the idea of a personal creator, that it is really inseparable from that idea; while a necessitarian religion is in an altogether false position and is destined to become disintegrated. But a pseudo-evolutionism which enthrones mechanical law above the principle of growth, is at once scientifically unsatisfactory, as giving no possible hint of how the universe has come about, and hostile to all hopes of personal relations to God.

Communication.

Consistently with the doctrine laid down in the beginning of this paper, I am bound to maintain that an idea can only be affected by an idea in continuous connection with it. By anything but an idea, it cannot be affected at all. This obliges me to say, as I do say, on other grounds, that what we call matter is not completely dead, but is merely mind hide-bound with habits. It still retains the element of diversification; and in that diversification there is life. When an idea is conveyed from one mind to another, it is by forms of combination of the diverse elements of nature, say by some curious symmetry, or by some union of a tender color with a refined odor. To such forms the law of mechanical energy has no application. If they are eternal, it is in the spirit they embody; and their origin cannot be accounted for by any mechanical necessity. They are embodied ideas; and so only can they convey ideas. Precisely how primary sensations, as colors and tones, are excited, we cannot tell, in the present state of psychology. But in our ignorance, I think that we are at liberty to suppose that they arise in essentially the same manner as the other feelings, called secondary. As far as sight and hearing are in question, we know that they are only excited by vibrations of inconceivable complexity; and the chemical senses are probably not more simple. Even the least psychical of peripheral sensations, that of pressure, has in its excitation conditions which, though apparently simple, are seen to be complicated enough when we consider the molecules and their attractions. The principle with which I set out requires me to maintain that these feelings are communicated to the nerves by continuity, so that there must be something like them in the excitants themselves. If this seems extravagant, it is to be remembered that it is the sole possible way of reaching any explanation of sensation, which otherwise must be pronounced a general fact, absolutely inexplicable and ultimate. Now absolute inexplicability is a hypothesis which sound logic refuses under any circumstances to justify.

I may be asked whether my theory would be favorable or otherwise to telepathy. I have no decided answer to give to this. At first sight, it seems unfavorable. Yet there may be modes of continuous connection between minds other than those of time and space.

The recognition by one person of another's personality takes place by means to some extent identical with the means by which he is conscious of his own personality. The idea of the second personality, which is as much as to say that second personality itself, enters within the field of direct consciousness of the first person, and is as immediately perceived as his ego, though less strongly. At the same time, the opposition between the two persons is perceived, so that the externality of the second is recognised.

The psychological phenomena of intercommunication between two minds have been unfortunately little studied. So that it is impossible to say, for certain, whether they are favorable to this theory or not. But the very extraordinary insight which some persons are able to gain of others from indications so slight that it is difficult to ascertain what they are, is certainly rendered more comprehensible by the view here taken.

A difficulty which confronts the synechistic philosophy is this. In considering personality, that philosophy is forced to accept the doctrine of a personal God; but in considering communication, it cannot but admit that if there is a personal God, we must have a direct perception of that person and indeed be in personal communication with him. Now, if that be the case, the question arises how it is possible that the existence of this being should ever have been doubted by anybody. The only answer that I can at present make is that facts that stand before our face and eyes and stare us in the face are far from being, in all cases, the ones most easily discerned. That has been remarked from time immemorial.

Conclusion.

I have thus developed as well as I could in a little space the *synechistic* philosophy, as applied to mind. I think that I have succeeded in making it clear that this doctrine gives room for explanations of many facts which without it are absolutely and hopelessly inexplicable; and further that it carries along with it the following doctrines: 1st, a logical realism of the most pronounced type; 2nd, objective idealism; 3rd, tychism, with its consequent thoroughgoing evolutionism. We also notice that the doctrine presents no hindrances to spiritual influences, such as some philosophies are felt to do.

PRAGMATISM

Charles S. Peirce. "Pragmatism." *Dictionary of Philosophy and Psychology*, ed. James Mark Baldwin (New York: Macmillan, 1902), vol. 2, pp. 321, 322.

The opinion that metaphysics is to be largely cleared up by the application of the following maxim for attaining clearness of apprehension: "Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object."

This maxim was first proposed by C. S. Peirce in the *Popular Science Monthly* for January, 1878 (xii. 287); and he explained how it was to be applied to the doctrine of reality. The writer was led to the maxim by reflection upon Kant's *Critic of the Pure Reason.* Substantially the same way of dealing with ontology seems to have been practised by the Stoics. The writer subsequently saw that the principle might easily be misapplied, so as to sweep away the whole doctrine of incommensurables, and, in fact, the whole Weierstrassian way of regarding the calculus. In 1896 William James published his *Will to Believe*, and later his *Philosophical Conceptions and Practical Results*, which pushed this method to such extremes as must tend to give us pause. The doctrine appears to assume that the end of man is action – a stoical axiom which, to the present writer at the age of sixty, does not recommend itself so forcibly as it did at thirty. If it be admitted, on the contrary, that action wants an end, and that that end must be something of a general description, then the spirit of the maxim itself, which is that we must look to the upshot of our concepts in order rightly to apprehend them, would direct us towards something different from practical facts, namely, to general ideas, as the true interpreters of our thought. Nevertheless, the maxim has approved itself to the writer, after many years of trial, as of great utility in leading to a relatively high grade of clearness of thought. He would venture to suggest that it should always be put into practice with conscientious thoroughness, but that, when that has been done, and not before, a still higher grade of clearness of thought can be attained by remembering that the only ultimate good which the practical facts to which it directs attention can subserve is to further the development of concrete reasonableness; so that the meaning of the concept does not lie in any individual reactions at all, but in the manner in which those reactions contribute to that development. Indeed, in the article of 1878, above referred to, the writer practised better than he

preached; for he applied the stoical maxim most unstoically, in such a sense as to insist upon the reality of the objects of general ideas in their generality.

A widely current opinion during the last quarter of a century has been that reasonableness is not a good in itself, but only for the sake of something else. Whether it be so or not seems to be a synthetical question, not to be settled by an appeal to the principle of contradiction – as if a reason for reasonableness were absurd. Almost everybody will now agree that the ultimate good lies in the evolutionary process in some way. If so, it is not in individual reactions in their segregation, but in something general or continuous. Synechism is founded on the notion that the coalescence, the becoming continuous, the becoming governed by laws, the becoming instinct with general ideas, are but phases of one and the same process of the growth of reasonableness. This is first shown to be true with mathematical exactitude in the field of logic, and is thence inferred to hold good metaphysically. It is not opposed to pragmatism in the manner in which C. S. Peirce applied it, but includes that procedure as a step.

THE MAXIM OF PRAGMATISM

Charles S. Peirce. "The Maxim of Pragmatism." R 301, Harvard Lecture 1, 26 March 1903.

This is the inaugural lecture in a series of seven "lectures on pragmatism" delivered at Harvard University in the spring of 1903. Peirce read it on 26 March 1903. The text is based on the surviving manuscript listed as MS 301 in Richard S. Robin's *Annotated Catalogue of the Papers of Charles S. Peirce* and preserved in the Houghton Library, Harvard University. Peirce did not title the lecture.

A certain maxim of Logic which I have called Pragmatism has recommended itself to me for divers reasons and on sundry considerations. Having taken it as my guide in most of my thought, I find that as the years of my knowledge of it lengthen, my sense of the importance of it presses upon me more and more. If it is only true, it is certainly a wonderfully efficient instrument. It is not to philosophy only that it is applicable. I have found it of signal service in every branch of science that I have studied. My want of skill in practical affairs does not prevent me from perceiving the advantage of being well imbued with pragmatism in the conduct of life.

Yet I am free to confess that objections to this way of thinking have forced themselves upon me and have been found more formidable the further my plummet has been dropped into the abyss of philosophy, and the closer my questioning at each new attempt to fathom its depths.

I propose, then, to submit to your judgment in half a dozen lectures an examination of the *pros* and *cons* of pragmatism by means of which I hope to show you the result of allowing to both *pros* and *cons* their full legitimate values. With more time I would gladly follow up the guiding thread so caught up and go on to ascertain what are the veritable conclusions, or at least the genera of veritable conclusions to which a carefully rectified pragmatism will truly lead. If you find what I say acceptable you will have learned something worth your while. If you can refute me, the gain will be chiefly on my side; but even in that even/t/, I anticipate your acknowledging, when I take my leave of you, that the discussion has not been without profit; and in future years I am confident that you will recur to these thoughts and find that you have more to thank me for than you could understand at first.

I suppose I may take it for granted that you all know what *pragmatism* is. I have met with a number of definitions of it lately, against none of which I am much disposed to raise any violent protest. Yet to say exactly what pragmatism is describes pretty well what you and I have to puzzle out together.

We must start with some rough approximation of it, and I am inclined to think that the shape in which I first stated it will be the most useful one to adopt as matter to work upon, chiefly because it is the form most personal to your lecturer, and which for that reason he can discourse *[on]* most intelligently. Besides, pragmatism and personality are more or less of the same kidney.

I sent forth my statement in January 1878; and for about twenty years never heard from it again. I let fly my dove; and that dove has never come back to me to this very day. But of late quite a brood of young ones have been fluttering about, from the feathers of which I might fancy that mine had found a brood. To speak plainly, a considerable number of philosophers have lately written as they might have written in case they had been reading either what I wrote but were ashamed to confess it, or had been reading something that some reader of mine had *[*written*]*. For they seem quite disposed to adopt my term *pragmatism*. I shouldn't wonder if they were ashamed of me. What could be more humiliating than to confess that one has learned anything of a logician? But for my part I am delighted to find myself sharing the opinions of so brilliant a company. The new pragmatists seem to be distinguished for their terse, vivid, and concrete style of expression together with a certain buoyancy of tone as if they were conscious of carrying about them the master key to all the secrets of metaphysics.

Every metaphysician is supposed to have some radical fault to find with every other, and I cannot find any direr fault with the new pragmatists than that they are *lively*. In order to be deep it is requisite to be dull.

On their side, one of the faults that I think they might find with me is that I make pragmatism to be a mere maxim of logic instead of a sublime principle of speculative philosophy.

In order to be admitted to better philosophical standing I have endeavored to put pragmatism as I understand it into the same form of a philosophical theorem. I have not succeeded any better than this:

> Pragmatism is the principle that every theoretical judgment expressible in a sentence in the indicative mood is a confused form of thought whose only meaning, if it has any, lies in its tendency to enforce a corresponding practical maxim expressible as a conditional sentence having its apodosis in the imperative mood.

But the Maxim of Pragmatism, as I originally stated it, *Revue Philosophique* VII, pp. 47, 48 and *Popular Science Monthly* XII, p. 293, is as follows:

> Pour développer le sens d'une pensée, il faut donc simplement déterminer quelles habitudes elle produit, car le sens d'une chose consiste simplement dans les habitudes qu'elle implique. Le caractère d'une habitude dépend de la façon dont elle peut nous faire agir non pas seulement dans telle circonstance probable, mais dans toute circonstance possible, si improbable qu'elle puisse être. Ce qu'est une habitude dépend de ces deux points: quand et comment elle fait agir. Pour le premier point: quand? tout stimulant à l'action dérive d'une perception; pour le second point: comment? le but de toute action est d'amener au résultat sensible. Nous atteignons ainsi le tangible et le pratique comme base de toute différence de pensée, si subtile qu'elle puisse être.
>
> Considérer quels sont les effets pratiques que nous pensons pouvoir être produits par l'objet de notre conception. La conception de tous ces effets est la conception complète de l'objet.
>
> Consider what effects that might conceivably have practical bearings we conceive the object of our conception to have: then, our conception of those effects is the whole of our conceptions of the object.

The utility of the maxim provided it is only true appears in a sufficient light in the original article. I will here add a few examples which were not given in that paper.

There are many problems connected with probabilities which are subject to doubt. One of them, for example, is this: Suppose an infinitely large company of infinitely rich men sit down to play against an infinitely rich bank at a game of chance, at which neither side has any advantage, each one betting a franc against a franc at each bet. Suppose that each player continues to play until he has netted a gain of one franc and then retires, surrendering his place to a new player.

The chance that a player will ultimately net a gain of a franc may be calculated as follows:

Let x_l be a player's chance, if he were to continue playing indefinitely, of ever netting a gain of l francs.

But after he has netted a gain of 1 franc, his chance of doing which is x_1, he is no richer than before, since he is infinitely rich. Consequently his chance of winning the second franc, after he has won the first, is the same as his chance of winning the first franc. That is, it is x_1 and his chance of winning both is $x_2 = (x_1)^2$. And so in general $x_l = (x_1)^l$.

Now his chance of netting a gain of 1 franc, x_1, is the sum of the chances of the two ways in which it may come about; namely, by first winning the first bet of which the chance is 1/2, and by first losing the first bet and then netting a gain of 2 francs of which the chance is $1/2\ x_1{}^2$.

Therefore

$$x_1 = 1/2 + 1/2x_1^2$$
$$\text{or} \quad x_1^2 - 2x_1 + 1 = 0$$
$$\text{or} \quad (x_1 - 1)^2 = 0.$$

But if the square of a number is zero, the number itself is zero. Therefore

$$x_1 - 1 = 0$$
$$\text{or} \quad x_1 = 1.$$

If so it must be certain that *every* player would win his franc and would retire.

Consequently there would be a continual outflow of money from the bank. And yet, since the game is an even one, the banker would not net any loss. How is this paradox to be explained?

The theory of probabilities is full of paradoxes and puzzles. Let us, then, apply the maxim of pragmatism to the solution of them.

In order to do this, we must ask, *What is meant by saying that the probability of an event has a certain value, p?* According to the maxim of pragmatism, then, we must ask what practical difference it can make whether the value is p or something else. Then we must ask how are probabilities applied to practical affairs. The answer is that the great business of insurance depends upon it. Probability is used in insurance to determine how much must be paid on a certain risk to make it safe to pay a certain sum if the event insured against should occur. Then, we must ask how can it be safe to engage to pay a large sum if an uncertain event occurs. The answer is that the insurance company does a very large business and is able to ascertain pretty closely out of a thousand risks of a given description how many in any one year will be losses. The business problem is this. The number of policies of a certain description that can be sold in a year will depend on the price set up on them. Let p be that price, and let n be the number that can be sold at that price, so that the larger p is, the smaller n will be. Now n being a large number a certain proportion q of these policies, qn in all, will be losses during the year; and if l be the loss on each, qnl will be the total loss. Then what the insurance company has to do is to set p at such a figure that $pn - qln$ or $(p - ql)n$ shall reach its maximum possible value.

The solution of this equation is

$$p = ql + (\partial p/\partial n)n.$$

where $\partial p/\partial n$ is the amount by which the price would have to be lowered in order to sell one policy more. Of course if the price were raised instead of lowered just one policy fewer would be sold.

For then by so lowering [the price,] the profit from being

$$(p - ql)n$$

would be changed to

$$(p - ql - (\partial p/\partial n))(n + 1)$$

that is, to

$$(p - ql)n + p - ql - (\partial p/\partial n)(n + 1)$$

and this being less than before

$$ql + (\partial p/\partial n)(n + 1) > p$$

and by raising it, the change would be to

$$(p - ql + (\partial p/\partial n))\ (n - 1)$$

that is, to

$$(p - ql)n - p + ql + (\partial p/\partial n)(n - 1)$$

and this being less than before

$$p > ql + (\partial p/\partial n)(n - 1).$$

So since p is intermediate between

$$ql + (\partial p/\partial n)n + (\partial p/\partial n)$$
$$\text{and}\quad ql + (\partial p/\partial n)n - (\partial p/\partial n)$$

and $(\partial p/\partial n)$ is very small, it must be very close to the truth to write

$$p = ql + (\partial p/\partial n)n.$$

This is the problem of insurance. Now in order that probability may have any bearing on this problem, it is obvious that it must be of the nature of a *real fact* and not a mere *state of mind*. For facts only enter into the solution of the problem of insurance. And this fact must evidently be a fact of statistics.

Without now going into certain reasons of detail that I should enter into if I were lecturing on probabilities, it must be that probability is a *statistical*

ratio and further in order to satisfy still more special conditions, it is convenient, for the class of problems to which insurance belongs, to make it the statistical ratio of the number of experiential occurrences of a specific kind to the number of experiential occurrences of a generic kind, in the long run.

In order, then, that probability should mean anything, it will be requisite to specify to what *species* of event it refers and to what *genus* of event it refers.

It also refers to a *long run*, that is, to an indefinitely long series of occurrences taken together in the order of their occurrence in possible experience.

In this view of the matter, we note, to begin with, that a given species of event considered as belonging to a given genus of events does not necessarily have any definite probability. Because the probability is the ratio of one infinite multitude to another. Now infinity divided by infinity is altogether indeterminate, except in special cases.

It is very easy to give examples of events that have no definite probability. If a person agrees [to] toss up a cent again and again forever and, beginning as soon as the first head turns up, whenever two heads are separated by any odd number of tails in the succession of throws, pay 2 to that power in cents provided that whenever the two successive heads are separated by any even number of throws he receives 2 to that power in cents,[1] it is impossible to say what the probability will be that he comes out a winner.

In half of the cases after the first head, the next throw will be a head and he will receive $(-2)^0 = 1$ cent, which, since it happens half the time, will be in the long run a winning of 1/2 a cent per head thrown.

But in half of the other half [of] the cases, that is, in a quarter of all the cases, one tail will intervene and he will have to receive $(-2)^1 = -2$ cents, i.e., he will have to pay 2 cents, which happening a quarter of the time will make an average loss of 1/2 a cent per head thrown.

But in half the remaining quarter of the cases, i.e., one eighth of all the cases, two tails will intervene, and he will receive $(-2)^2 = 4$ cents, which happening once every eight times, will be worth 1/2 a cent per head thrown and so on; so that his account in the long run will be

$$1/2 - 1/2 + 1/2 - 1/2 + 1/2 - 1/2 + 1/2 - 1/2 \text{ ad infinitum},$$

the sum of which may be 1/2 or may be *zero*. Or rather it is quite indeterminate.

If instead of being paid $(-2)^n$ when n is the number of intervening tails, he were paid $(-2)^{n^2}$ the result would be that he would probably either win or lose enormously without there being any definite probability that it would be winning rather than losing.

[1] He receives $(-2)^n$ cents if n tails intervene between two successive heads.

I think I may recommend this game with confidence to gamblers as being the most frightful ruin yet invented; and a little cheating would do everything in it.

Now let us revert to our original problem and consider the state of things after every other bet. After the second,

G|G 1/4 of the players will have gained, gone out, and been replaced by players who have gained and gone out so that a number of francs equal to half the number of seats will have been paid out by the bank;
G|L 1/4 of the players will have gained and gone out and been replaced by players who have lost, making the bank even;
L|G 1/4 of the players will have lost and then gained, making the bank and them even;
L|L 1/4 of the players will have lost twice, making a gain to the bank of half as many francs as there are seats at the table.

The bank then will be where it was. Players to the number of three quarters of the seats will have netted their franc each; but players to the number of a quarter of the seats will have lost two francs each and another equal number one franc each, just paying for the gains of those who have retired.

That is the way it will happen every time. Just before the fifth bet of the player at the table, 3/8 will have lost nothing, 1/4 will have lost one franc, 1/4 two francs, 1/16 three francs and 1/16 four francs. Thus some will always have lost a good deal. Those who sit at the table will among them always have paid just what those who have gone out have carried away.

But it will be asked How then can it happen that *all* gain? I reply that I never said all would gain, I only said the probability was 1 that any one would ultimately gain his franc. But does not probability 1 mean certainty? Not at all, it only means that the ratio of the number of those who ultimately gain to the total number is 1. Since the number of seats at the table is infinite, the ratio of the number of those who never gain to the number of seats may be zero and yet they may be infinitely numerous. So that probabilities 1 and 0 are very far from corresponding to certainty *pro* and *con*.

If I were to go into practical matters, the advantage of pragmatism, of looking at the substantial practical issue, would be still more apparent. But here pragmatism is generally practised by successful men. In fact, the genus of efficient men *[is]* mainly distinguished from the inefficient precisely by this.

There is no doubt, then, that pragmatism opens a very easy road to the solution of an immense variety of questions. But it does not at all follow from that, that it is true. On the contrary, one may very properly entertain a suspicion of any method which so resolves the most difficult questions into easy problems. No doubt Ockham's razor is logically sound. A hypothesis should be stripped of every feature which is in no wise called for to furnish

an explanation of observed facts. *Entia non sunt multiplicanda praeter necessitatem*; only we may very well doubt whether a very simple hypothesis can contain every factor that is necessary. Certain it is that most hypotheses which at first seemed to unite great simplicity with entire sufficiency have had to be greatly complicated in the further progress of science.

What is the *proof* that the possible practical consequences of a concept constitute the sum total of the concept? The argument upon which I rested the maxim in my original paper was that *belief* consists mainly in being deliberately prepared to adopt the formula believed in as the guide to action. If this be in truth the nature of belief, then undoubtedly the proposition believed in can itself be nothing but a maxim of conduct. That, I believe, is quite evident.

But *how do we know* that belief is nothing but the deliberate preparedness to act according to the formula believed?

My original article carried this back to a psychological principle. The conception of truth according to me was developed out of an original impulse to act consistently, to have a definite intention. But in the first place, this was not very clearly made out, and in the second place, I do not think it satisfactory to reduce such fundamental things to facts of psychology. For man could alter his nature, or his environment would alter it if he did not voluntarily do so, if the impulse were not what was advantageous or fitting. Why has evolution made man's mind to be so constructed? That is the question we must nowadays ask, and all attempts to ground the fundamentals of logic on psychology are seen to be essentially shallow.

The question of the nature of belief, or in other words the question of what the true logical analysis of the act of judgment is, is the question upon which logicians of late years have chiefly concentrated their energies. Is the pragmatistic answer satisfactory?

Do we not all perceive that *judgment* is something closely allied to *assertion?* That is the view that ordinary speech entertains. A man or woman will be heard to use the phrase "I says to myself." That is, *judgment* is held to be either no more than an *assertion to oneself* or at any rate something very like that.

Now it is a fairly easy problem to analyze the nature of *assertion*. To find an easily dissected example, we shall naturally take a case where the assertive element is magnified, – a very formal assertion, such as an affidavit. Here a man goes before a notary or magistrate and takes such action that if what he says is not true, evil consequences will be visited upon him, and this he does with a view to thus causing other men to be affected just as they would if the proposition sworn to had presented itself to them as a perceptual fact.

We thus see that the act of assertion is an act of a totally different nature from the act of apprehending the meaning of the proposition and we cannot expect that any analysis of what assertion is or any analysis of what *judgment*

or *belief* is, if that act is at all allied to assertion, should throw any light at all on the widely different question of what the apprehension of the meaning of a proposition is.

What is the difference between making an *assertion* and *laying a wager?* Both are acts whereby the agent deliberately subjects himself to evil consequences if a certain proposition is not true. Only when he offers to bet he hopes the other man will make himself responsible in the same way for the truth of the contrary proposition; while when he makes an *assertion* he always (or almost always) wishes the man to whom he makes it to be led to do what he does. Accordingly, in our vernacular "I will bet" so and so, is the phrase expressive of a private opinion which one does not expect others to share, while "You bet"___ is a form of assertion intended to cause another to follow suit.

Such then seems at least in a preliminary glance at the matter to be a satisfactory account of assertion. Now let us pass to judgment and belief. There can, of course, be no question that a man will act in accordance with his belief so far as his belief has any practical consequences. The only doubt is whether this is *all* that belief is, whether belief is a mere nullity so far as it does not influence conduct. What possible effect upon conduct can it have, for example, to believe that the diagonal of a square is incommensurable with the side? Name a discrepancy *?* no matter how small, and the diagonal differs from a rational quantity by much less than that. Professor Newcomb in his calculus and all mathematicians of his rather antiquated fashion think that they have proved two quantities to be equal when they have proved that they differ by less than any assignable quantity. I once tried hard to make Newcomb say whether the diagonal of the square differed from a rational fraction of the side or not; but he saw what I was driving at and would not answer. The proposition that the diagonal is incommensurable has stood in the textbooks from time immemorial without ever being assailed and I am sure that the most modern type of mathematician holds to it most decidedly. Yet it seems quite absurd to say that there is any objective practical difference between commensurable and incommensurable.

Of course you can say if you like that the act of expressing a quantity as a rational fraction is a piece of conduct and that it is in itself a *practical* difference that one kind of quantity can be so expressed and the other not. But a thinker must be shallow indeed if he does not see that to admit a species of practicality that consists in one's conduct about words and modes of expression is at once to break down all the bars against the nonsense that pragmatism is designed to exclude.

What the pragmatist has his pragmatism for is to be able to say "here is a definition and it does not differ at all from your confusedly apprehended conception because there is no *practical* difference." But what is to prevent his opponent from replying that there is a practical difference which consists

in his recognizing one as his conception and not the other. That is, one is expressible in a way in which the other is not expressible.

Pragmatism is completely volatilized if you admit that sort of practicality.

It must be understood that all I am now attempting to show is that Pragmatism is apparently a matter of such great probable concern, and at the same time so much doubt hangs over its legitimacy, that it will be well worth our while to make a methodical, scientific, and thorough examination of the whole question, so as to make sure of our ground, and obtain some secure method for such a preliminary filtration of questions as pragmatism professes to furnish.

Let us, then, enter upon this inquiry. But before doing so let us mark out the proposed course of it. That should always be done in such cases, even if circumstances subsequently require the plan to be modified, as they usually will.

Although our inquiry is to be an inquiry into truth, whatever the truth may turn out to be, and therefore of course is not to be influenced by any liking for pragmatism or any pride in it as an American doctrine, yet still we do not come to this inquiry any more than anybody comes to any inquiry in that blank state that the lawyers pretend to insist upon as desirable; though I give them credit for enough common sense to know better.

We have some reason already to think there is some truth in pragmatism although we also have some reason to think that there is something wrong with it. For unless both branches of this statement were true we should do wrong to waste time and energy upon the inquiry we are undertaking.

I will, therefore, presume that there is enough truth in it to render a preliminary glance at ethics desirable. For if, as pragmatism teaches us, what we think is to be interpreted in terms of what we are prepared to do, then surely *logic*, or the doctrine of what we ought to think, must be an application of the doctrine of what we deliberately choose to do, which is Ethics.

But we cannot get any clue to the secret of Ethics, – a most entrancing field of thought but sown broadcast with pitfalls, – until we have first made up our formula for what it is that we are prepared to admire. I do not care what doctrine of ethics be embraced, it will always be so. Suppose for example our maxim of ethics to be Pearson's that all our action ought to be directed toward the perpetuation of the biological stock to which we belong. Then the question will arise, On what principle should it be deemed such a fine thing for this stock to survive, – or a fine thing at all? Is there nothing in the world or *in posse* that would be admirable *per se* except copulation and swarming? Is swarming a fine thing at all apart from any results that it may lead to? The course of thought will follow a parallel line if we consider Marshall's ethical maxim: "Act to restrain the impulses which demand immediate reaction, in order that the impulse-order determined by the existence of impulses of less strength, but of wider significance, may have full weight in the guidance of

your life." Although I have not as clear an apprehension as I could wish of the philosophy of this very close, but too technical, thinker, yet I presume that he would not be among those who would object to making Ethics dependent upon Esthetics. Certainly, this maxim which I have just read to you from his latest book supposes that it is a fine thing for an impulse to have its way, but yet not an equally fine thing for one impulse to have its way and for another impulse to have its way. There is a preference which depends upon the *significance* of impulses, whatever that may mean. It supposes that there is some ideal state of things which regardless of how it should be brought about and independently of any ulterior reason whatsoever, is held to be good or fine.

In short, ethics must rest upon a doctrine which without at all considering what our conduct is to be, divides ideally possible states of things into two classes, those that would be admirable and those that would be unadmirable, and undertakes to define precisely what it is that constitutes the admirableness of an ideal. Its problem is to determine by analysis what it is that one ought deliberately to admire *per se* in itself regardless of what it may lead to and regardless of its bearings upon human conduct. I call that inquiry *Esthetics*, because it is generally said that the three normative sciences are logic, ethics, and esthetics, being the three doctrines that distinguish *[*the*]* good and the bad, *Logic* in regard to representations of truth, *Ethics* in regard to efforts of will, and *Esthetics* in objects considered simply in their presentation. Now that third normative science can I think be no other than that which I have described. It is evidently the basic normative science upon which as a foundation the doctrine of ethics must be reared to be surmounted in its turn by the doctrine of logic.

But before we can attack any normative science, any science which proposes to separate the sheep from the goats, it is plain that there must be a preliminary inquiry which shall justify the attempt to establish such dualism. This must be a science that does *not* draw any distinction of good and bad in any sense whatever, but just contemplates phenomena as they are, simply opens its eyes and describes what it sees. Not what it sees in the real as distinguished from figment, – not regarding any such dichotomy, – but simply describing the object, as a phenomenon, and stating what it finds in all phenomena alike. This is the science which Hegel made his starting point, under the name of the *Phänomenologie des Geistes*, – although he considered it in a fatally narrow spirit, since he restricted himself to what *actually* forces itself on the mind and so colored his whole philosophy with the ignoration of the distinction of essence and existence and so gave it the nominalistic and I might say in a certain sense the *pragmatoidal* character in which the worst of the Hegelian errors have their origin. I will so far follow Hegel as to call this science *Phenomenology* although I will not restrict it to the observation and analysis of *experience* but extend it to describing all the features that are

common to whatever is *experienced* or might conceivably be experienced or become an object of study in any way direct or indirect.

Hegel was quite right in holding that it was the business of this science to bring out and make clear the *Categories* or fundamental modes. He was also right in holding that these *categories* are of two kinds, the universal categories, all of which apply to everything, and the series of categories consisting of phases of evolution.

As to these latter, I am satisfied that Hegel has not approximated to any correct catalogue of them. It may be that here and there, in the long wanderings of his *Encyclopaedia* he has been a little warmed by the truth. But in all its main features his catalogue is utterly wrong, according to me. I have made long and arduous studies of this matter, but I have not been able to draw up any catalogue that satisfies me. My studies, if they are ever published, will I believe be found helpful to future students of this most difficult problem; but in these lectures I shall have little to say on that subject. The case is quite different with the three Universal Categories, which Hegel, by the way, does not look upon as Categories at all, or at least he does not call them so, but as three stages of thinking. In regard to these, it appears to me that Hegel is so nearly right that my own doctrine might very well be taken for a variety of Hegelianism, although in point of fact it was determined in my mind by considerations entirely foreign to Hegel, at a time when my attitude toward Hegelianism was one of contempt. There was no influence upon me from Hegel unless it was of so occult a kind as to entirely escape my ken; and if there was such an occult influence, it strikes me as about as good an argument for the essential truth of the doctrine, as is the coincidence that Hegel and I arrived in quite independent ways substantially to the same result.

This science of phenomenology, then, must be taken as the basis upon which normative science is to be erected, and accordingly must claim our first attention.

This science of Phenomenology is in my view the most primal of all the positive sciences. That is, it is not based, as to its principles, upon any other *positive science*. By a *positive science* I mean an inquiry which seeks for *positive* knowledge, that is, for such knowledge as may conveniently be expressed in a *categorical proposition*. Logic and the other normative sciences, although they ask, not what *is* but what *ought to be*, nevertheless are positive sciences since it is by asserting positive, categorical truth that they are able to show that what they call good really is so; and the right reason, right effort, and right being of which they treat derive that character from positive categorical fact.

Perhaps you will ask me whether it is possible to conceive of a science which should not aim to declare that something is positively or categorically true. I reply that it is not only possible to conceive of such a science, but that such science exists and flourishes, and Phenomenology, which does not depend

upon any other *positive science*, nevertheless must, if it is to be properly grounded, be made to depend upon the Conditional or Hypothetical Science of *Pure Mathematics*, whose only aim is to discover not how things actually are, but how they might be supposed to be, if not in our universe, then in some other. A Phenomenology which does not reckon with pure mathematics, a science hardly come to years of discretion when Hegel wrote, will be the same pitiful clubfooted affair that Hegel produced.

PRAGMATISM AS THE LOGIC OF ABDUCTION

Charles S. Peirce. "Pragmatism as the Logic of Abduction." R 315, Harvard Lecture 7, 14 May 1903.

This is the last of seven lectures on pragmatism Peirce delivered at Harvard University in the spring of 1903. Delivered on 14 May 1903, this lecture was not titled by Peirce. The text is based on MS 315, as listed in Richard Robin's *Annotated Catalogue of the Papers of Charles S. Peirce* and preserved in the Houghton Library, Harvard University.

I

Ladies and Gentlemen:

I am impelled to express my sense of gratitude at your kind interest in coming to listen to an extra lecture at this busy season of the year. I shall feel myself under an obligation to make a special endeavor to say something germinative.

At the end of my last lecture I had just enunciated three propositions which seem to me to give to pragmatism its peculiar character. In order to be able to refer to them briefly this evening, I will call them for the nonce my *cotary* propositions. *Cos, cotis* is a whetstone. They appear to me to put the edge on the maxim of pragmatism.

These *cotary* propositions are as follows:

First, *Nihil est in intellectu quin prius fuerit in sensu*. I take this in a sense somewhat different from that which Aristotle intended. By *intellectus*, I understand the *meaning* of any representation in any kind of cognition, virtual, symbolic, or whatever it may be. Berkeley and nominalists of his stripe deny that we have any idea at all of a triangle in general, which is neither equilateral, isosceles, nor scalene. But he cannot deny that there are propositions about triangles in general, which propositions are either true or false; and as long as that is the case, whether we have an *idea* of a triangle in some psychological sense or not, I do not, as a logician, care. We have an *intellectus*, a meaning, of which the triangle in general is an element. As for the other term, *in sensu*, that I take in the sense of in a *perceptual judgment*, the

starting-point or first premiss of all critical and controlled thinking. I will state presently what I conceive to be the evidence of the truth of this first cotary proposition. But I prefer to begin by recalling to you what all three of them are.

The second is that perceptual judgments contain general elements, so that universal propositions are deducible from them in the manner in which the logic of relations shows that particular propositions usually, not to say invariably, allow universal propositions to be necessarily inferred from them. This I sufficiently argued in my last lecture. This evening I shall take the truth of it for granted.

The third cotary proposition is that abductive inference shades into perceptual judgment without any sharp line of demarcation between them; or in other words our first premisses, the perceptual judgments, are to be regarded as an extreme case of abductive inferences, from which they differ in being absolutely beyond criticism. The abductive suggestion comes to us like a flash. It is an act of *insight*, although of extremely fallible insight. It is true that the different elements of the hypothesis were in our minds before; but it is the idea of putting together what we had never before dreamed of putting together which flashes the new suggestion before our contemplation.

On its side, the perceptive judgment is the result of a process, although of a process not sufficiently conscious to be controlled, or to state it more truly, not controllable and therefore not fully conscious. If we were to subject this subconscious process to logical analysis we should find that it terminated in what that analysis would represent as an abductive inference resting on the result of a similar process which a similar logical analysis would represent to be terminated by a similar abductive inference, and so on *ad infinitum*. This analysis would be precisely analogous to that which the sophism of Achilles and the Tortoise applies to the chase of the Tortoise by Achilles, and it would fail to represent the real process for the same reason. Namely, just as Achilles does not have to make the series of distinct endeavors which he is represented as making, so this process of forming the perceptual judgment, because it is subconscious and so not amenable to logical criticism, does not have to make separate acts of inference but performs its act in one continuous process.

II

I have already put in my brief in favor of my second cotary proposition, and in what I am about to say I shall treat that as already sufficiently proved. In arguing it I avoided all resort to anything like special phenomena, upon which I do not think that philosophy ought to rest, at all. Still, there is no harm in using special observations merely in an abductive way to throw a light upon doctrines otherwise established, and to aid the mind in grasping them; and

there are some phenomena which, I think, do aid us to see what is meant by asserting that perceptual judgments contain general elements, and which will also naturally lead up to a consideration of the third cotary proposition.

I will show you a figure which I remember my father drawing in one of his lectures. I do not remember what it was supposed to show; but I cannot imagine what else it could have been but my cotary proposition No. 2. If so, in maintaining that proposition I am substantially treading in his foot-prints, though he would doubtless have put the proposition into a shape very different from mine. Here is the figure (though I cannot draw it as skillfully as he did). It consists of a serpentine line. But when it is completely drawn, it appears to be a stone wall. The point is that

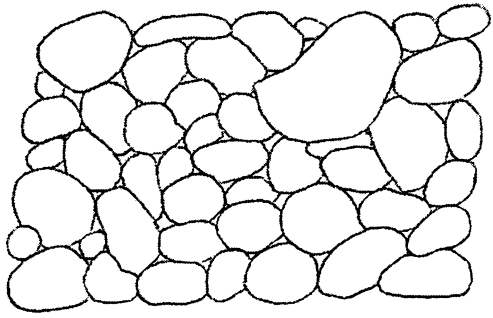

Figure 7

there are two ways of conceiving the matter. Both, I beg you to remark, are *general ways of classing the line*, general classes under which the line is subsumed. But the very decided preference of our perception for one mode of classing the percept shows that this classification is contained in the perceptual judgment. So it is with that well-known unshaded outline figure of a pair of steps seen in perspective. We seem at first to be looking at the steps from above; but some unconscious part of the mind seems to tire of putting that construction upon it and suddenly we seem to see the steps from below, and so the perceptive judgment and the percept itself seem to keep shifting from one general aspect to the other and back again.

In all such visual illusions, of which two or three dozen are well known, the most striking thing is that a certain theory of interpretation of the figure has all the appearance of being given in perception. The first time it is shown to us, it seems as completely beyond the control of rational criticism as any percept is; but after many repetitions of the now familiar experiment, the illusion wears off, becoming first less decided, and ultimately ceasing completely. This shows that these phenomena are true connecting links between abductions and perceptions.

If the percept or perceptual judgment were of a nature entirely unrelated to abduction, one would expect that the percept would be entirely free from any characters that are proper to *interpretations*, while it can hardly fail to have such characters if it be merely a continuous series of what discretely and consciously performed would be abductions. We have here then almost a crucial test of my third cotary proposition. Now, then, how is the fact? The fact is that it is not necessary to go beyond ordinary observations of common life to find a variety of widely different ways in which perception is interpretative.

The whole series of hypnotic phenomena, of which so many fall within the realm of ordinary everyday observation, – such as our waking up at the hour we wish to wake much nearer than our waking selves could guess it, – involve the fact that we perceive what we are adjusted for interpreting though it be far less perceptible than any express effort could enable us to perceive; while that to the interpretation of which our adjustments are not fitted, we fail to perceive although it exceed in intensity what we should perceive with the utmost ease if we cared at all for its interpretation. It is a marvel to me that the clock in my study strikes every half hour in the most audible manner, and yet I never hear it. I should not know at all whether the striking part were going, unless it is out of order and strikes the wrong hour. If it does that, I am pretty sure to hear it. Another familiar fact is that we perceive, or seem to perceive, objects differently from how they really are, accommodating them to their manifest intention. Proof-readers get high salaries because ordinary people miss seeing misprints, their eyes correcting them. We can repeat the *sense* of a conversation but we are often quite mistaken as to what words were uttered. Some politicians think it a clever thing to convey an idea which they carefully abstain from stating in words. The result is that a reporter is ready to swear quite sincerely that a politician said something to him which the politician was most careful not to say.

I should tire you if I dwelt further on anything so familiar, especially to every psychological student, as the interpretativeness of the perceptive judgment. It is plainly nothing but the extremest case of Abductive Judgment.

If this third cotary proposition be admitted, the second, that the perceptual judgment contains general elements, must be admitted; and as for the first, that all general elements are given in perception, that loses most of its significance. For if a general element were given otherwise than in the perceptual judgment, it could only first appear in an abductive suggestion, and that is now seen to amount substantially to the same thing. I not only opine, however, that every general element of every hypothesis, however wild or sophisticated it may be, is given somewhere in perception, but I will venture so far as to assert that every general *form* of putting concepts together is, in its elements, given in perception. In order to decide whether this be so or not, it is necessary to form a clear notion of the precise difference between

abductive judgment and the perceptual judgment which is its limiting case. The only symptom by which the two can be distinguished is that we cannot form the least conception of what it would be to deny the perceptual judgment. If I judge a perceptual image to be red, I can conceive of another man's not having that same percept. I can also conceive of his having this percept but never having thought whether it was red or not. I can conceive that while colors are among his sensations he shall never have had his attention directed to them. Or I can conceive that instead of redness a somewhat different conception should arise in his mind, that he should, for example, judge that this percept has a warmth of color. I can imagine that the redness of my percept is excessively faint and dim so that one can hardly make sure of whether it is red or not. But that any man should have a percept similar to mine and should ask himself the question whether this percept be *red*, which would imply that he had already judged *some* percept to be red, and that he should, upon careful attention to this percept, pronounce it to be decidedly and clearly *not* red, when I judge it to be prominently red, *that* I cannot comprehend at all. An abductive suggestion, however, is something whose truth *can* be questioned or even denied.

We thus come to the *test of inconceivability* as the only means of distinguishing between an abduction and a perceptual judgment. Now I fully assent to all that Stuart Mill so forcibly said in his *Examination of Hamilton* as to the utter untrustworthiness of the test of inconceivability. That which is inconceivable to us today, may prove tomorrow to be conceivable and even probable; so that we never can be absolutely sure that a judgment is perceptual and not abductive; and this may seem to constitute a difficulty in the way of satisfying ourselves that the first cotary proposition is true. At the same time, this difficulty will appear less serious when we remark that in regard to the vast majority of propositions of which men are in the habit of saying that their falsity is inconceivable, when we put the question in this form, "Is this directly perceived?", it will readily be proved that it is not perceived. For example, a man might say, "If I were to face precisely east and walk straight forward sixty steps and were then to turn to the right precisely through a right angle and were to walk straight forward fifty steps and then were to turn to the right precisely through a right angle and were to walk straight forward fifty steps and then were to turn to the right precisely through a right angle and were to walk straight forward until I was on the point of crossing my first path, I directly perceive that I should have to turn precisely through a right angle in order to walk over my previous path." A man, I say, might say that, but I should say to him, "You have, no doubt, been supposing that you would be walking on a level surface, although you did not explicitly say so. But it has probably not occurred to you that a level surface may have any shape whatever, according to the distribution of attracting masses. If you were facing due east on the earth's surface and were to walk straight forward along

the path of minimum length, when you had walked sixty paces you would no longer be facing due east but a little to the south of east, so that what you have been saying you perceived would not be the fact. Now then you wish to suppose you were walking on a plane surface. But what do you mean by a plane surface? If you mean one upon which what you are saying would be true, then of course, it is an identical proposition to say that it would be as you say. But if by a plane you mean a surface which, turned upside down, could be brought into exact coincidence with its former position throughout, then you must acknowledge that you do not evidently perceive any connection between this particular property of a plane surface and the property of a surface on which four right angles should make the quadrilateral close precisely."

In ways more or less like this, the class of cases in which abductions may be mistaken for perceptions can be considerably narrowed. Nevertheless, it must be acknowledged that this class of cases, however it may be restricted, is not thus eliminated. It may therefore very likely be objected that doubt must perforce on this account hang over my first cotary proposition that every general element of thought is given in perceptive judgment. This objection, however, involves a logical fallacy. No doubt in regard to the first cotary proposition follows as a necessary consequence of the possibility that what are really abductions have been mistaken for perceptions. For the question is whether that which really is an abductive result can contain elements foreign to its premisses. It must be remembered that abduction, although it is very little hampered by logical rules, nevertheless is logical inference, asserting its conclusion only problematically or conjecturally it is true, but nevertheless having a perfectly definite logical form.

Long before I first classed abduction as an inference it was recognized by logicians that the operation of adopting an explanatory hypothesis, – which is just what abduction is, – was subject to certain conditions. Namely, the hypothesis cannot be admitted, even as a hypothesis, unless it be supposed that it would account for the facts or some of them. The form of inference therefore is this:

> The surprising fact, *C*, is observed;
> But if *A* were true, *C* would be a matter of course.
> Hence, there is reason to suspect that *A* is true.

Thus, *A* cannot be abductively inferred, or if you prefer the expression, cannot be abductively conjectured, until its entire contents is already present in the premiss, "If *A* were true, *C* would be a matter of course."

Whether this be a correct account of the matter or not, the mere suggestion of it as a possibility shows that the bare fact that abductions may be mistaken for perceptions does not necessarily affect the force of an argument to show that quite new conceptions cannot be obtained from abduction.

But when the account just given of abduction is proposed as a proof that all conceptions must be given substantially in perception, three objections will be started. Namely, in the first place, it may be said that even if this be the normative form of abduction, the form to which abduction *ought* to conform, yet it may be that new conceptions arise in a manner which puts the rules of logic at defiance. In the second place, waiving this objection, it may be said that the argument would prove too much; for if it were valid, it would follow that no hypothesis could be so fantastic as not to have presented itself entire in experience. In the third place, it may be said that granting that the abductive conclusion "*A* is true" rests upon the premiss "If *A* is true, *C* is true," still it would be contrary to common knowledge to assert that the antecedents of all conditional judgments are given in perception, and thus it remains almost certain that some conceptions have a different origin.

In answer to the first of these objections, it is to be remarked that it is only in Deduction that there is no difference between a *valid* argument and a *strong* one. An argument is valid if it possesses the sort of strength that it professes and tends toward the establishment of the conclusion in the way in which it pretends to do this. But the question of its strength does not concern the comparison of the due effect of the argument with its pretensions, but simply rests upon how great its due effect is. An argument is nonetheless logical for being weak, provided it does not pretend to a strength that it does not possess. It is, I suppose, in view of this that the best modern logicians outside the English school never say a word about fallacies. They assume that there is no such thing as an argument illogical in itself. An argument is fallacious only so far as it is mistakenly, though not illogically, inferred to have professed what it did not perform. Perhaps it may be said that if all our reasonings conform to the laws of logic, this is, at any rate, nothing but a proposition in psychology which my principles ought to forbid my recognizing. But I do not offer it as a principle of psychology only. For a principle of psychology is a contingent truth, while this, as I contend, is a necessary truth. Namely, if a fallacy involves nothing in its conclusion which was not in its premisses, that is, nothing that was not in any previous knowledge that aided in suggesting it, then the forms of logic will invariably and necessarily enable us logically to account for it as due to a mistake arising from the use of a logical but weak argumentation. In most cases it is due to an abduction. The conclusion of an abduction is problematic or conjectural, but is not necessarily at the weakest grade of surmise, and what we call assertoric judgments are, accurately, problematic judgments of a high grade of hopefulness. There is therefore no difficulty in maintaining that fallacies are merely due to mistakes which are logically valid, though weak, argumentations. If, however, a fallacy contains something in the conclusion which was not in the premisses at all, that is, was in no previous knowledge or none that influenced the result, then again a mistake due as before to weak inference has been committed; only in

this case the mistake consists in taking that to be an inference which, in respect to this new element, is not an inference, at all. That part of the conclusion which inserts the wholly new element can be separated from the rest with which it has no logical connection nor appearance of logical connection. The first emergence of this new element into consciousness must be regarded as a perceptive judgment. We are irresistibly led to judge that we are conscious of it. But the connection of this perception with other elements must be an ordinary logical inference, subject to error like all inference.

As for the second objection that, according to my account of abduction, every hypothesis, however fantastic, must have presented itself entire in perception, I have only to say that this could only arise in a mind entirely unpracticed in the logic of relations, and apparently quite oblivious of any other mode of inference than abduction. Deduction accomplishes first the simple colligation of different perceptive judgments into a copulative whole, and then, with or without the aid of other modes of inference, is quite capable of so transforming this copulative proposition so as to bring certain of its parts into more intimate connection.

But the third objection is the really serious one. In it lies the whole nodus of the question and its full refutation would be quite a treatise. If the antecedent is not given in a perceptive judgment, then it must first emerge in the conclusion of an inference. At this point we are obliged to draw the distinction between the matter and the logical form. With the aid of the logic of relations it would be easy to show that the entire logical matter of a conclusion must in any mode of inference be contained, piecemeal, in the premisses. Ultimately therefore it must come from the uncontrolled part of the mind, because a series of controlled acts must have a first. But as to the logical *form*, it would be, at any rate, extremely difficult to dispose of it in the same way. An induction, for example, concludes in a ratio of frequency; but there is nothing about any such ratio in the single instances on which it is based. Where do the conceptions of deductive necessity, of inductive probability, of abductive expectability come from? Where does the conception of inference itself come from? That is the only difficulty. But self-control is the character which distinguishes reasoning from the processes by which perceptual judgments are formed, and self-control of any kind is purely *inhibitory*. It originates nothing.

Therefore it cannot be in the act of adoption of an inference, in the pronouncing of it to be reasonable, that the formal conceptions in question can first emerge. It must be in the first perceiving that so one might conceivably reason. And what is the nature of that? I see that I have instinctively described the phenomenon as a "perceiving." I do not wish to argue from words; but a word may furnish a valuable suggestion. What can our first acquaintance with an inference, when it is not yet adopted, be but a perception, – a perception of the world of ideas? In the first suggestion of it

the inference must be thought of as an inference, because when it is adopted there is always the thought that so one might reason in a whole class of cases. But the mere act of inhibition cannot introduce this conception. The inference must, then, be thought of as an inference in the first suggestion of it. Now when an inference is thought of *as* an inference, the conception of inference becomes a part of the *matter* of thought. Therefore, the same argument which we used in regard to matter in general applies to the conception of inference. But I am prepared to show in detail, and indeed virtually have shown, that all the forms of logic can be reduced to combinations of the conception of inference, the conception of otherness, and the conception of a character. These are obviously simply forms of Thirdness, Secondness, and Firstness of which the last two are unquestionably given in perception. Consequently the whole logical form of thought is so given in its elements.

III

It appears to me, then, that my three cotary propositions are satisfactorily grounded. Nevertheless, since others may not regard them as so certain as I myself do, I propose in the first instance to disregard them, and to show that, even if they are put aside as doubtful, a maxim practically little differing in most of its applications from that of pragmatism ought to be acknowledged and followed; and after this has been done, I will show how the recognition of the cotary propositions will affect the matter.

I have argued in several of my early papers that there are but three essentially different modes of reasoning: Deduction, Induction, and Abduction. I may mention in particular papers in the *Proceedings of the American Academy of Arts and Sciences* for April and May 1867. I must say, however, that it would be very easy to misunderstand those arguments. I did not at first fully comprehend them myself. I cannot restate the matter tonight, although I am very desirous of doing so, for I could now put it in a much clearer light. I have already explained to you briefly what these three modes of inference, Deduction, Induction, and Abduction, are. I ought to say that when I described induction as the experimental testing of a hypothesis, I was not thinking of experimentation in the narrow sense in which it is confined to cases in which we ourselves deliberately create the peculiar conditions under which we desire to study a phenomenon. I mean to extend it to every case in which, having ascertained by deduction that a theory would lead us to anticipate under certain circumstances phenomena contrary to what we should expect if the theory were *not* true, we examine the cases of that sort to see how far those predictions are borne out.

If you carefully consider the question of pragmatism you will see that it is nothing else than the question of the logic of abduction. That is, pragmatism proposes a certain maxim which, if sound, must render needless any further

rule as to the admissibility of hypotheses to rank as hypotheses, that is to say, as explanations of phenomena held as hopeful suggestions; and furthermore, this is *all* that the maxim of pragmatism really pretends to do, at least so far as it is confined to logic, and is not understood as a proposition in psychology. For the maxim of pragmatism is that a conception can have no logical effect or import differing from that of a second conception except so far as, taken in connection with other conceptions and intentions, it might conceivably modify our practical conduct differently from that second conception. Now it is indisputable that no rule of abduction would be admitted by *any* philosopher which should prohibit on any formalistic grounds any inquiry as to how we ought in consistency to shape our practical conduct. Therefore, a maxim which looks only to possibly practical considerations will not need any supplement in order to exclude any hypotheses as inadmissible. What hypothesis it admits all philosophers would agree ought to be admitted. On the other hand, if it be true that nothing but such considerations has any logical effect or import whatever, it is plain that the maxim of pragmatism cannot cut off any kind of hypothesis which ought to be admitted. Thus, the maxim of pragmatism, if true, fully *covers* the entire logic of abduction. It remains to inquire whether this maxim may not have some *further* logical effect. If so, it must in some way affect inductive or deductive inference. But that pragmatism cannot interfere with induction is evident; because induction simply teaches us what we have to expect as a result of experimentation, and it is plain that any such expectation *may* conceivably concern practical conduct. In a certain sense it *must* affect *deduction*. Anything which gives a rule to abduction and so puts a limit upon admissible hypotheses will cut down *the premisses* of deduction, and thereby will render a *reductio ad absurdum* and other equivalent forms of deduction possible which would not otherwise have been possible. But here three remarks may be made. First, to affect the *premisses* of deduction is not to affect the logic of deduction. For in the process of deduction itself no conception is introduced to which pragmatism could be supposed to object except the act of abstraction. Concerning that, I have only time to say that pragmatism ought not to object to it. Secondly, no effect of pragmatism which *is consequent upon its effect on abduction* can go to show that pragmatism is anything more than a doctrine concerning the logic of abduction. Thirdly, if pragmatism is the doctrine that every conception is a conception of conceivable practical effects, it makes conception reach far beyond the practical. It allows any flight of imagination, provided this imagination ultimately alights upon a possible practical effect, and thus many hypotheses may seem at first glance to be excluded by the pragmatical maxim that are not really so excluded.

IV

Admitting, then, that the Question of Pragmatism is the Question of Abduction, let us consider it under that form. What is good abduction? What should an explanatory hypothesis be to be worthy to rank as a hypothesis? Of course, it must explain the facts. But what other conditions ought it to fulfill to be good? The question of the goodness of anything is whether that thing fulfills its end. What, then, is the end of an explanatory hypothesis? Its end is, through subjection to the test of experiment, to lead to the avoidance of all surprise and to the establishment of a habit of positive expectation that shall not be disappointed. Any hypothesis, therefore, may be admissible, in the absence of any special reasons to the contrary, provided it be capable of experimental verification, and only in so far as it is capable of such verification. This is approximately the doctrine of pragmatism. But just here a broad question opens out before us. What are we to understand by experimental verification? The answer to that involves the whole logic of induction. Let me point out to you the different opinions which we actually find men holding today, – perhaps not consistently, but thinking that they hold them, – upon this subject.

In the first place, we find men who maintain that no hypothesis ought to be admitted, even as a hypothesis, any further than its truth or its falsity is *capable* of being directly perceived. This, as well as I can make out, is what was in the mind of Auguste Comte, who is generally assumed to have first formulated this maxim. Of course, this maxim of abduction supposes that, as people say, we "are to believe only what we actually see"; and there are well-known writers, and writers of no little intellectual force, who maintain that it is unscientific to make predictions, – unscientific, therefore, to expect anything. One ought to restrict one's opinions to what one actually perceives. I need hardly say that that position cannot be consistently maintained. It refutes itself; for it is *itself* an opinion relating to more than is actually in the field of momentary perception.

In the second place, there are those who hold that a theory which has sustained a number of experimental tests may be expected to sustain a number of other similar tests, and to have a general approximate truth, the justification of this being that this kind of inference must prove correct in the long run, as I explained in a previous lecture. But these logicians refuse to admit that we can ever have a right to conclude definitely that a hypothesis is *exactly* true, that is, that it should be able to sustain experimental tests in endless series; for, they urge, no hypothesis can be subjected to an endless series of tests. They are willing we should say that a theory is true, because, all our ideas being more or less vague and approximate, what we mean by saying that a theory is true can only be that it is very near true. But they will not allow us to say that anything put forth as an anticipation of experience should assert exactitude, because exactitude in experience would imply experiences in endless series, which is impossible.

In the third place, the great body of scientific men hold that it is too much to say that induction must be restricted to that for which there can be *positive* experimental evidence. They urge that the rationale of induction, as it is understood by logicians of the second group themselves, entitles us to hold a theory provided it be such that, if it involve any falsity, experiment must some day detect that falsity. We, therefore, have a right, they will say, to infer that something *never* will happen, provided it be of such a nature that it could not occur without being detected.

I wish to avoid in the present lecture *arguing* any such points, because the substance of all sound argumentation about pragmatism, has, as I conceive it, been already given in previous lectures, and there is no end to the forms in which it might be stated. I must, however, except from this statement the logical principles which I intend to state in tomorrow evening's lecture on multitude and continuity; and for the sake of making the relation clear between this third position and the fourth and fifth, I must anticipate a little what I shall further explain tomorrow.

What ought persons who hold this third position to say to the Achilles sophism? Or rather this is not precisely what I wish to inquire, but rather what would they be obliged to say as to Achilles overtaking the tortoise, Achilles and the tortoise being geometrical points, supposing that our only knowledge was derived inductively from observations of the relative positions of Achilles and the tortoise at those stages of the progress that the sophism supposes, and supposing that Achilles really moves twice as fast as the tortoise? They ought to say that *if* it could not happen that Achilles, in one of those stages of his progress, should at length reach a certain finite distance behind the tortoise which he would be unable to halve, *without our learning that fact*, then we should have a right to conclude that he could halve *every* distance and consequently that he could make his distance behind the tortoise less than *all* fractions having a power of two for the denominator. Therefore unless those logicians were to suppose a distance less than any measurable distance, which would be contrary to their principles, they would be obliged to say that Achilles could reduce his distance behind the tortoise to *zero*.

The reason why it would be contrary to their principles to admit any distance less than a measurable distance, is that their way of supporting induction implies that they differ from the logicians of the second class, in that these third-class logicians admit that we can infer a proposition implying an infinite multitude and therefore implying the reality of the infinite multitude itself, while their mode of justifying induction would exclude every infinite multitude except the lowest grade, that of the multitude of all integer numbers. Because with reference to a greater multitude than that, it would not be true that what did not occur in a finite ordinal place in a series could not occur anywhere within the infinite series, – which is the only reason they admit for the inductive conclusion.

But now let us look at something else that those logicians would be obliged to admit. Namely, suppose any regular polygon to have all its vertices joined by straight radii to its center. Then if there were any particular finite number of sides for a regular polygon with radii so drawn, which had the singular property that it should be impossible to bisect all the angles by new radii equal to the others and, by connecting the extremities of each new radius to those of the two adjacent old radii, to make a new polygon of double the number of angles, – if, I say, there were any *finite number* of sides for which this could not be done, it may be admitted that

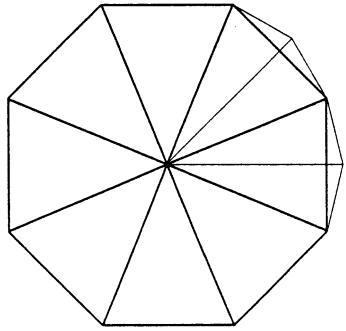

Figure 8

we should be able to find it out. The question I am asking supposes arbitrarily that they admit that. Therefore these logicians of the third class would have to admit that all such polygons could so have their sides doubled and that consequently there would be a polygon of an infinite multitude of sides which could be, on their principles, nothing else than the circle. But it is easily proved that the perimeter of that polygon, that is, the circumference of the circle, would be incommensurable, so that an incommensurable measure is real and thence it easily follows that all such lengths are real or possible. But these exceed in multitude the only multitude those logicians admit. Without any geometry, the same result could be reached, supposing only that we have an indefinitely bisectible quantity.

We are thus led to a fourth opinion very common among mathematicians, who generally hold that any one irrational real quantity, – say of length, for example, – whether algebraical or transcendental in its general expression, is just as possible and admissible as any rational quantity, but who generally reason that if the distance between two points is less than any assignable quantity, that is, less than any finite quantity, then it is nothing at all. If that be the case, it is possible for us to conceive, with mathematical precision, a state of things in favor of whose actual reality there would seem to be no

possible sound argument, however weak. For example, we can conceive that the diagonal of a square is incommensurable with its side. That is to say, if you first name any length commensurable with the side, the diagonal will differ from that by a finite quantity (and a commensurable quantity), yet however accurately we may measure the diagonal of an apparent square, there will always be a limit to our accuracy and the measure will always be commensurable. So we never could have any reason to think it otherwise. Moreover if there be, as they seem to hold, no other points on a line than such as are at distances assignable to an indefinite approximation, it will follow that if a line has an extremity, that extreme point may be conceived to be taken away, so as to leave the line without any extremity while leaving all the other points just as they were. In that case, all the points stand discrete and separate; and the line might be torn apart at any number of places without disturbing the relations of the points to one another. Each point has, on that view, its own independent existence, and there can be no merging of one into another. There is no continuity of points in the sense in which continuity implies generality.

In the fifth place it may be held that we can be justified in inferring true generality, true continuity. But I do not see in what way we ever can be justified in doing so unless we admit the cotary propositions, and in particular that such continuity is given in perception, that is, that whatever the underlying psychical process may be, we seem to perceive a genuine flow of time, such that instants melt into one another without separate individuality.

It would not be necessary for me to deny a psychical theory which should make this to be illusory in such sense as there can be in saying that anything beyond all logical criticism is illusory, but I confess I should strongly suspect that such a psychological theory involved a logical inconsistency; and at best it could do nothing at all toward solving the logical question.

V

There are two functions which we may properly require that Pragmatism should perform; or if not pragmatism, whatever the true doctrine of the Logic of Abduction may be ought to do these two services.

Namely, it ought, in the first place, to give us an expeditious riddance of all ideas essentially unclear. In the second place, it ought to lend support to, and help to render distinct, ideas essentially clear but more or less difficult of apprehension; and in particular, it ought to take a satisfactory attitude toward the element of thirdness.

Of these two offices of Pragmatism, there is at the present day not so crying a need of the first as there was a quarter of a century ago when I enunciated the maxim. The state of logical thought is very much improved. Thirty years ago when, in consequence of my study of the logic of relations,

I told philosophers that all conceptions ought to be defined, with the sole exception of the familiar concrete conceptions of everyday life, my opinion was considered in every school to be utterly incomprehensible. The doctrine then was, as it remains in nineteen out of every score of logical treatises that are appearing in these days, that there is no way of defining a term except by enumerating all its universal predicates, each of which is more abstracted and general than the term defined. So unless this process can go on endlessly, which was a doctrine little followed, the explication of a concept must stop at such ideas as Pure Being, Agency, Substance, and the like, which were held to be ideas so perfectly simple that no explanation whatever could be given of them. This grotesque doctrine was shattered by the logic of relations, which showed that the simplest conceptions, such as Quality, Relation, Self-consciousness, could be defined and that such definitions would be of the greatest service in dealing with them. By this time, although few really study the logic of relations, one seldom meets with a philosopher who continues to think the most general relations are particularly simple in any except a technical sense; and of course, the only alternative is to regard as the simplest the practically applied notions of familiar life. We should hardly find today a man of Kirchhoff's rank in science saying that we know exactly what energy *does* but what energy *is* we do not know in the least. For the answer would be that energy being a term in a dynamical equation, if we know how to apply that equation, we thereby know what energy is, although we may suspect that there is some more fundamental law underlying the laws of motion.

In the present situation of philosophy, it is far more important that Thirdness should be adequately dealt with by our logical maxim of abduction. The urgent pertinence of the question of thirdness, at this moment of the break-up of agnostic calm, when we see that the chief difference between philosophers is in regard to the extent to which they allow elements of thirdness a place in their theories, is too plain to be insisted upon.

I shall take it for granted that, as far as *thought* goes, I have sufficiently shown that thirdness is an element not reducible to secondness and firstness. But even if so much be granted, three attitudes may be taken:

1st, that thirdness, though an element of the mental phenomenon, ought not to be admitted into a theory of the real, because it is not experimentally verifiable;

2nd, that thirdness is experimentally verifiable, that is, is inferable by induction, although it cannot be directly perceived;

3rd, that it is directly perceived, from which the other cotary propositions can hardly be separated.

The man who takes the first position ought to admit no general law as really operative. Above all, therefore, he ought not to admit the law of laws, the law of the uniformity of nature. He ought to abstain from all prediction, however

qualified by a confession of fallibility. But that position can practically not be maintained.

The man who takes the second position will hold thirdness to be an addition which the operation of induction introduces over and above what its premisses in any way contain, and further that this element, though not perceived in experiment, is justified *by* experiment. Then his conception of reality must be such as completely to sunder the real from perception; and the puzzle for him will be why perception should be allowed such authority in regard to what is real.

I do not think that man can consistently hold that there is room in time for an event between any two events separate in time. But even if he could, he would (if he could grasp the reasoning) be forced to acknowledge that the contents of time consists of separate, independent, unchanging states, and nothing else. There would not be even a determinate order of sequence among these states. He might insist that one order of sequence was more readily grasped by us; but nothing more. Every man is fully satisfied that there is such a thing as truth, or he would not ask any question. *That* truth consists in a conformity to something *independent of his thinking it to be so*, or of any man's opinion on that subject. But for the man who holds this second opinion the only reality there could be would be conformity to the ultimate result of inquiry. But there would not be any course of inquiry possible except in the sense that it would be easier for him so to interpret the phenomenon; and ultimately he would be forced to say that there was no reality at all except that he now at this instant finds a certain way of thinking easier than any other. But that violates the very idea of reality and of truth.

The man who takes the third position and accepts the cotary propositions will hold with firmest of grasps to the recognition that logical criticism is limited to what we can control. In the future we may be able to control more but we must consider what we can now control. Some elements we can control in some limited measure. But the contents of the perceptual judgment cannot be sensibly controlled now, nor is there any rational hope that it ever can be. Concerning that quite uncontrolled part of the mind, logical maxims have as little to do as with the growth of hair and nails. We may be dimly able to see that in part it depends on the accidents of the moment, in part on what is personal or racial, in part on what is common to all nicely adjusted organisms whose equilibrium has narrow ranges of stability, in part on whatever is composed of vast collections of independently variable elements, in part on whatever reacts, and in part on whatever has any mode of being. But the sum of it all is that our logically controlled thoughts compose a small part of the mind, the mere blossom of a vast complexus which we may call the instinctive mind in which this man will not say that he has *faith* because that implies the conceivability of distrust, but upon which he builds as the very fact to which it is the whole business of his logic to be true.

That he will have no difficulty with Thirdness is clear enough, because he will hold that the conformity of action to general intentions is as much given in perception as is the element of action itself which cannot really be mentally torn away from such general purposiveness. There can be no doubt that he will allow hypotheses fully all the range they ought to be allowed. The only question will be whether he succeeds in excluding from hypotheses everything unclear and nonsensical. It will be asked whether he will not have a shocking leaning toward anthropomorphic conceptions? I fear I must confess that he will be inclined to see an anthropomorphic, or even a zoömorphic, if not a physiomorphic element in all our conceptions. But against unclear and nonsensical hypotheses, whatever aegis there may be in pragmatism will be more essentially significant for him than for any other logician for the reason that it is in action that logical energy returns to the uncontrolled and uncriticizable parts of the mind. His maxim will be this:

> The elements of every concept enter into logical thought at the gate of perception and make their exit at the gate of purposive action; and whatever cannot show its passports at both those two gates is to be arrested as unauthorized by reason.

The digestion of such thoughts is slow, ladies and gentlemen; but when you come in the future to reflect upon all that I have said, I am confident you will find the seven hours you have spent in listening to these ideas have not been altogether wasted.

WHAT PRAGMATISM IS

Charles S. Peirce. "What Pragmatism Is." *The Monist* 15.2 (April 1905): 161–181.

The writer of this article has been led by much experience to believe that every physicist, and every chemist, and, in short, every master in any department of experimental science, has had his mind moulded by his life in the laboratory to a degree that is little suspected. The experimentalist himself can hardly be fully aware of it, for the reason that the men whose intellects he really knows about are much like himself in this respect. With intellects of widely different training from his own, whose education has largely been a thing learned out of books, he will never become inwardly intimate, be he on ever so familiar terms with them; for he and they are as oil and water, and though they be shaken up together, it is remarkable how quickly they will go their several mental ways, without having gained more than a faint flavor from the association. Were those other men only to take skilful soundings of the experimentalist's mind, – which is just what they are unqualified to do, for the most part, – they would soon discover that, excepting perhaps upon topics where his mind is trammelled by personal feeling or by his bringing up, his disposition is to think of everything just as everything is thought of in the laboratory, that is, as a question of experimentation. Of course, no living man possesses in their fullness all the attributes characteristic of his type: it is not the typical doctor whom you will see every day driven in buggy or coupé, nor is it the typical pedagogue that will be met with in the first school-room you enter. But when you have found, or ideally constructed upon a basis of observation, the typical experimentalist, you will find that whatever assertion you may make to him, he will either understand as meaning that if a given prescription for an experiment ever can be and ever is carried out in act, an experience of a given description will result, or else he will see no sense at all in what you say. If you talk to him as Mr. Balfour talked not long ago to the British Association, saying that "the physicist seeks for something deeper than the laws connecting possible objects of experience," that "his object is a physical reality" unrevealed in experiments, and that the existence of such non-experiential reality "is the unalterable faith of science," to all such ontological meaning you will find the experimentalist mind to be color-blind. What adds to that confidence in this which the writer owes to his conversations with experimentalists is that he himself may almost be said to

have inhabited a laboratory from the age of six until long past maturity; and having all his life associated mostly with experimentalists, it has always been with a confident sense of understanding them and of being understood by them.

That laboratory life did not prevent the writer (who here and in what follows simply exemplifies the experimentalist type) from becoming interested in methods of thinking; and when he came to read metaphysics, although much of it seemed to him loosely reasoned and determined by accidental prepossessions, yet in the writings of some philosophers, especially Kant, Berkeley, and Spinoza, he sometimes came upon strains of thought that recalled the ways of thinking of the laboratory, so that he felt he might trust to them; all of which has been true of other laboratory-men.

Endeavoring, as a man of that type naturally would, to formulate what he so approved, he framed the theory that a *conception*, that is, the rational purport of a word or other expression, lies exclusively in its conceivable bearing upon the conduct of life; so that, since obviously nothing that might not result from experiment can have any direct bearing upon conduct, if one can define accurately all the conceivable experimental phenomena which the affirmation or denial of a concept could imply, one will have therein a complete definition of the concept, and *there is absolutely nothing more in it*. For this doctrine he invented the name *pragmatism*. Some of his friends wished him to call it *practicism* or *practicalism* (perhaps on the ground that *πρακτικός* is better Greek than *πραγματικός*). But for one who had learned philosophy out of Kant, as the writer, along with nineteen out of every twenty experimentalists who have turned to philosophy, had done, and who still thought in Kantian terms most readily, *praktisch* and *pragmatisch* were as far apart as the two poles, the former belonging in a region of thought where no mind of the experimentalist type can ever make sure of solid ground under his feet, the latter expressing relation to some definite human purpose. Now quite the most striking feature of the new theory was its recognition of an inseparable connection between rational cognition and rational purpose; and that consideration it was which determined the preference for the name *pragmatism*.

* * *

Concerning the matter of philosophical nomenclature, there are a few plain considerations, which the writer has for many years longed to submit to the deliberate judgment of those few fellow-students of philosophy, who deplore the present state of that study, and who are intent upon rescuing it therefrom and bringing it to a condition like that of the natural sciences, where investigators, instead of contemning each the work of most of the others as misdirected from beginning to end, co-operate, stand upon one another's shoulders,

and multiply incontestable results; where every observation is repeated, and isolated observations go for little; where every hypothesis that merits attention is subjected to severe but fair examination, and only after the predictions to which it leads have been remarkably borne out by experience is trusted at all, and even then only provisionally; where a radically false step is rarely taken, even the most faulty of those theories which gain wide credence being true in their main experiential predictions. To those students, it is submitted that no study can become scientific in the sense described, until it provides itself with a suitable technical nomenclature, whose every term has a single definite meaning universally accepted among students of the subject, and whose vocables have no such sweetness or charms as might tempt loose writers to abuse them, – which is a virtue of scientific nomenclature too little appreciated. It is submitted that the experience of those sciences which have conquered the greatest difficulties of terminology, which are unquestionably the taxonomic sciences, chemistry, mineralogy, botany, zoölogy, has conclusively shown that the only way in which the requisite unanimity and requisite ruptures with individual habits and preferences can be brought about is so to shape the canons of terminology that they shall gain the support of *moral principle* and of every man's sense of decency; and that, in particular (under defined restrictions), the general feeling shall be that he who introduces a new conception into philosophy is under an obligation to invent acceptable terms to express it, and that when he has done so, the duty of his fellow-students is to accept those terms, and to resent any wresting of them from their original meanings, as not only a gross discourtesy to him to whom philosophy was indebted for each conception, but also as an injury to philosophy itself; and furthermore, that once a conception has been supplied with suitable and sufficient words for its expression, no other *technical* terms denoting the same things, considered in the same relations, should be countenanced. Should this suggestion find favor, it might be deemed needful that the philosophians in congress assembled should adopt, after due deliberation, convenient canons to limit the application of the principle. Thus, just as is done in chemistry, it might be wise to assign fixed meanings to certain prefixes and suffixes. For example, it might be agreed, perhaps, that the prefix *prope-* should mark a broad and rather indefinite extension of the meaning of the term to which it was prefixed; the name of a doctrine would naturally end in *-ism*, while *-icism* might mark a more strictly defined acception of that doctrine, etc. Then again, just as in biology no account is taken of terms antedating Linnæus, so in philosophy it might be found best not to go back of the scholastic terminology. To illustrate another sort of limitation, it has probably never happened that any philosopher has attempted to give a general name to his own doctrine without that name's soon acquiring, in common philosophical usage, a signification much broader than was originally intended. Thus, special systems go by the names Kantianism, Benthamism, Comtianism,

Spencerianism, etc., while transcendentalism, utilitarianism, positivism, evolutionism, synthetic philosophy, etc., have irrevocably and very conveniently been elevated to broader governments.

* * *

After awaiting in vain, for a good many years, some particularly opportune conjuncture of circumstances that might serve to recommend his notions of the ethics of terminology, the writer has now, at last, dragged them in over head and shoulders, on an occasion when he has no specific proposal to offer nor any feeling but satisfaction at the course usage has run without any canons or resolutions of a congress. His word "pragmatism" has gained general recognition in a generalised sense that seems to argue power of growth and vitality. The famed psychologist, James, first took it up, seeing that his "radical empiricism" substantially answered to the writer's definition of pragmatism, albeit with a certain difference in the point of view. Next, the admirably clear and brilliant thinker, Mr. Ferdinand C. S. Schiller, casting about for a more attractive name for the "anthropomorphism" of his *Riddles of the Sphinx*, lit, in that most remarkable paper of his on "Axioms as Postulates," upon the same designation "pragmatism," which in its original sense was in generic agreement with his own doctrine, for which he has since found the more appropriate specification "humanism," while he still retains "pragmatism" in a somewhat wider sense. So far all went happily. But at present, the word begins to be met with occasionally in the literary journals, where it gets abused in the merciless way that words have to expect when they fall into literary clutches. Sometimes the manners of the British have efflo-resced in scolding at the word as ill-chosen, – ill-chosen, that is, to express some meaning that it was rather designed to exclude. So then, the writer, finding his bantling "pragmatism" so promoted, feels that it is time to kiss his child good-by and relinquish it to its higher destiny; while to serve the precise purpose of expressing the original definition, he begs to announce the birth of the word "pragmaticism," which is ugly enough to be safe from kidnappers.[1]

Much as the writer has gained from the perusal of what other pragmatists have written, he still thinks there is a decisive advantage in his original conception of the doctrine. From this original form every truth that follows

[1] To show how recent the general use of the word "pragmatism" is, the writer may mention that, to the best of his belief, he never used it in copy for the press before to-day, except by particular request, in *Baldwin's Dictionary*. Toward the end of 1890, when this part of the *Century Dictionary* appeared, he did not deem that the word had sufficient status to appear in that work. But he has used it continually in philosophical conversation since, perhaps, the mid-seventies.

from any of the other forms can be deduced, while some errors can be avoided into which other pragmatists have fallen. The original view appears, too, to be a more compact and unitary conception than the others. But its capital merit, in the writer's eyes, is that it more readily connects itself with a critical proof of its truth. Quite in accord with the logical order of investigation, it usually happens that one first forms an hypothesis that seems more and more reasonable the further one examines into it, but that only a good deal later gets crowned with an adequate proof. The present writer having had the pragmatist theory under consideration for many years longer than most of its adherents, would naturally have given more attention to the proof of it. At any rate, in endeavoring to explain pragmatism, he may be excused for confining himself to that form of it that he knows best. In the present article there will be space only to explain just what this doctrine (which, in such hands as it has now fallen into, may probably play a pretty prominent part in the philosophical discussions of the next coming years) really consists in. Should the exposition be found to interest readers of *The Monist*, they would certainly be much more interested in a second article which would give some samples of the manifold applications of pragmaticism (assuming it to be true) to the solution of problems of different kinds. After that, readers might be prepared to take an interest in a proof that the doctrine is true, – a proof which seems to the writer to leave no reasonable doubt on the subject, and to be the one contribution of value that he has to make to philosophy. For it would essentially involve the establishment of the truth of synechism.

The bare definition of pragmaticism could convey no satisfactory comprehension of it to the most apprehensive of minds, but requires the commentary to be given below. Moreover, this definition takes no notice of one or two other doctrines without the previous acceptance (or virtual acceptance) of which pragmaticism itself would be a nullity. They are included as a part of the pragmatism of Schiller, but the present writer prefers not to mingle different propositions. The preliminary propositions had better be stated forthwith.

The difficulty in doing this is that no formal list of them has ever been made. They might all be included under the vague maxim, "Dismiss make-believes." Philosophers of very diverse stripes propose that philosophy shall take its start from one or another state of mind in which no man, least of all a beginner in philosophy, actually is. One proposes that you shall begin by doubting everything, and says that there is only one thing that you cannot doubt, as if doubting were "as easy as lying." Another proposes that we should begin by observing "the first impressions of sense," forgetting that our very percepts are the results of cognitive elaboration. But in truth, there is but one state of mind from which you can "set out," namely, the very state of mind in which you actually find yourself at the time you do "set out," – a state in which you are laden with an immense mass of cognition already formed, of which you

cannot divest yourself if you would; and who knows whether, if you could, you would not have made all knowledge impossible to yourself? Do you call it *doubting* to write down on a piece of paper that you doubt? If so, doubt has nothing to do with any serious business. But do not make believe; if pedantry has not eaten all the reality out of you, recognise, as you must, that there is much that you do not doubt, in the least. Now that which you do not at all doubt, you must and do regard as infallible, absolute truth. Here breaks in Mr. Make Believe: "What! Do you mean to say that one is to believe what is not true, or that what a man does not doubt is *ipso facto* true?" No, but unless he can make a thing white and black at once, *he* has to regard what he does not doubt as absolutely true. Now you, *per hypothesis*, are that man. "But you tell me there are scores of things I do not doubt. I really cannot persuade myself that there is not some one of them about which I am mistaken." You are adducing one of your make-believe facts, which, even if it were established, would only go to show that doubt has a *limen*, that is, is only called into being by a certain finite stimulus. You only puzzle yourself by talking of this metaphysical "truth" and metaphysical "falsity," that you know nothing about. All you have any dealings with are your doubts and beliefs,[2] with the course of life that forces new beliefs upon you and gives you power to doubt old beliefs. If your terms "truth" and "falsity" are taken in such senses as to be definable in terms of doubt and belief and the course of experience (as for example they would be, if you were to define the "truth" as that to a belief in which belief would tend if it were to tend indefinitely toward absolute fixity), well and good: in that case, you are only talking about doubt and belief. But if by truth and falsity you mean something not definable in terms of doubt and belief in any way, then you are talking of entities of whose existence you can know nothing, and which Ockham's razor would clean shave off. Your problems would be greatly simplified, if, instead of saying that you want to know the "Truth," you were simply to say that you want to attain a state of belief unassailable by doubt.

Belief is not a momentary mode of consciousness; it is a habit of mind essentially enduring for some time, and mostly (at least) unconscious; and like other habits, it is (until it meets with some surprise that begins its dissolution) perfectly self-satisfied. Doubt is of an altogether contrary genus. It is not a habit, but the privation of a habit. Now a privation of a habit, in order to be anything at all, must be a condition of erratic activity that in some way must get superseded by a habit.

[2] It is necessary to say that "belief" is throughout used merely as the name of the contrary to doubt, without regard to grades of certainty nor to the nature of the proposition held for true, i.e. "believed."

Among the things which the reader, as a rational person, does not doubt, is that he not merely has habits, but also can exert a measure of self-control over his future actions; which means, however, *not* that he can impart to them any arbitrarily assignable character, but, on the contrary, that a process of self-preparation will tend to impart to action (when the occasion for it shall arise) one fixed character, which is indicated and perhaps roughly measured by the absence (or slightness) of the feeling of self-reproach, which subsequent reflection will induce. Now, this subsequent reflection is part of the self-preparation for action on the next occasion. Consequently, there is a tendency, as action is repeated again and again, for the action to approximate indefinitely toward the perfection of that fixed character, which would be marked by entire absence of self-reproach. The more closely this is approached, the less room for self-control there will be; and where no self-control is possible there will be no self-reproach.

These phenomena seem to be the fundamental characteristics which distinguish a rational being. Blame, in every case, appears to be a modification, often accomplished by a transference, or "projection," of the primary feeling of self-reproach. Accordingly, we never blame anybody for what had been beyond his power of previous self-control. Now, thinking is a species of conduct which is largely subject to self-control. In all their features (which there is no room to describe here), logical self-control is a perfect mirror of ethical self-control, – unless it be rather a species under that genus. In accordance with this, what you cannot in the least help believing is not, justly speaking, wrong belief. In other words, for you it is the absolute truth. True, it is conceivable that what you cannot help believing to-day, you might find you thoroughly disbelieve to-morrow. But then there is a certain distinction between things you "cannot" do merely in the sense that nothing stimulates you to the great effort and endeavors that would be required, and things you cannot do because in their own nature they are insusceptible of being put into practice. In every stage of your excogitations, there is something of which you can only say, "I cannot think otherwise," and your experientially based hypothesis is that the impossibility is of the second kind.

There is no reason why "thought," in what has just been said, should be taken in that narrow sense in which silence and darkness are favorable to thought. It should rather be understood as covering all rational life, so that an experiment shall be an operation of thought. Of course, that ultimate state of habit to which the action of self-control ultimately tends, where no room is left for further self-control, is, in the case of thought, the state of fixed belief, or perfect knowledge.

Two things here are all-important to assure oneself of and to remember. The first is that a person is not absolutely an individual. His thoughts are what he is "saying to himself," that is, is saying to that other self that is just coming into life in the flow of time. When one reasons, it is that critical self

that one is trying to persuade; and all thought whatsoever is a sign, and is mostly of the nature of language. The second thing to remember is that the man's circle of society (however widely or narrowly this phrase may be understood) is a sort of loosely compacted person, in some respects of higher rank than the person of an individual organism. It is these two things alone that render it possible for you, – but only in the abstract, and in a Pickwickian sense, – to distinguish between absolute truth and what you do not doubt.

Let us now hasten to the exposition of pragmaticism itself. Here it will be convenient to imagine that somebody to whom the doctrine is new, but of rather preternatural perspicacity, asks questions of a pragmaticist. Everything that might give a dramatic illusion must be stripped off, so that the result will be a sort of cross between a dialogue and a catechism, but a good deal liker the latter, – something rather painfully reminiscent of Mangnall's *Historical Questions*.

Questioner: I am astounded at your definition of your pragmatism, because only last year I was assured by a person above all suspicion of warping the truth, – himself a pragmatist, – that your doctrine precisely was "that a conception is to be tested by its practical effects." You must surely, then, have entirely changed your definition very recently.

Pragmaticist: If you will turn to Vols. VI and VII of the *Revue Philosophique*, or to the *Popular Science Monthly* for November 1877 and January 1878, you will be able to judge for yourself whether the interpretation you mention was not then clearly excluded. The exact wording of the English enunciation (changing only the first person into the second) was: "Consider what effects that might conceivably have practical bearings you conceive the object of your conception to have. Then your conception of those effects is the WHOLE of your conception of the object."

Questioner: Well, what reason have you for asserting that this is so?

Pragmaticist: That is what I specially desire to tell you. But the question had better be postponed until you clearly understand what those reasons profess to prove.

Questioner: What, then, is the *raison d'être* of the doctrine? What advantage is expected from it?

Pragmaticist: It will serve to show that almost every proposition of ontological metaphysics is either meaningless gibberish, – one word being defined by other words, and they by still others, without any real conception ever being reached, – or else is downright absurd; so that all such rubbish being swept away, what will remain of philosophy will be a series of problems capable of investigation by the observational methods of the true sciences, – the truth about which can be reached without those interminable misunderstandings and disputes which have made the highest of the positive sciences a mere amusement for idle intellects, a sort of chess, – idle pleasure its purpose, and reading out of a book its method. In this regard, pragmaticism

is a species of prope-positivism. But what distinguishes it from other species is, first, its retention of a purified philosophy; secondly, its full acceptance of the main body of our instinctive beliefs; and thirdly, its strenuous insistence upon the truth of scholastic realism (or a close approximation to that, well-stated by the late Dr. Francis Ellingwood Abbot in the Introduction to his *Scientific Theism*). So, instead of merely jeering at metaphysics, like other prope-positivists, whether by long drawn-out parodies or otherwise, the pragmaticist extracts from it a precious essence, which will serve to give life and light to cosmology and physics. At the same time, the moral applications of the doctrine are positive and potent; and there are many other uses of it not easily classed. On another occasion, instances may be given to show that it really has these effects.

Questioner: I hardly need to be convinced that your doctrine would wipe out metaphysics. Is it not as obvious that it must wipe out every proposition of science and everything that bears on the conduct of life? For you say that the only meaning that, for you, any assertion bears is that a certain experiment has resulted in a certain way: Nothing else but an experiment enters into the meaning. Tell me, then, how can an experiment, in itself, reveal anything more than that something once happened to an individual object and that subsequently some other individual event occurred?

Pragmaticist: That question is, indeed, to the purpose, – the purpose being to correct any misapprehensions of pragmaticism. You speak of an experiment in itself, emphasising "*in itself*." You evidently think of each experiment as isolated from every other. It has not, for example, occurred to you, one might venture to surmise, that every connected series of experiments constitutes a single collective experiment. What are the essential ingredients of an experiment? First, of course, an experimenter of flesh and blood. Secondly, a verifiable hypothesis. This is a proposition[3] relating to the universe environing the experimenter, or to some well-known part of it and affirming or denying of this only some experimental possibility or impossibility. The third indispensable ingredient is a sincere doubt in the experimenter's mind as to the truth of that hypothesis. Passing over several ingredients on which we need not dwell, the purpose, the plan, and the resolve, we come to the act of choice by which the experimenter singles out certain identifiable objects to be operated upon. The next is the external (or quasi-external) ACT by which

[3] The writer, like most English logicians, invariably uses the word *proposition*, not as the Germans define their equivalent, *Satz*, as the language-expression of a judgment *(Urtheil)*, but as that which is related to any assertion, whether mental and self-addressed or outwardly expressed, just as any possibility is related to its actualisation. The difficulty of the, at best, difficult problem of the essential nature of a Proposition has been increased, for the Germans, by their *Urtheil*, confounding, under one designation, the mental *assertion* with the *assertible*.

he modifies those objects. Next, comes the subsequent *reaction* of the world upon the experimenter in a perception; and finally, his recognition of the teaching of the experiment. While the two chief parts of the event itself are the action and the reaction, yet the unity of essence of the experiment lies in its purpose and plan, the ingredients passed over in the enumeration.

Another thing: in representing the pragmaticist as making rational meaning to consist in an experiment (which you speak of as an event in the past), you strikingly fail to catch his attitude of mind. Indeed, it is not in an experiment, but in *experimental phenomena*, that rational meaning is said to consist. When an experimentalist speaks of a *phenomenon*, such as "Hall's phenomenon," "Zeeman's phenomenon" and its modification, "Michelson's phenomenon," or "the chess-board phenomenon," he does not mean any particular event that did happen to somebody in the dead past, but what *surely will* happen to everybody in the living future who shall fulfil certain conditions. The phenomenon consists in the fact that when an experimentalist shall come to *act* according to a certain scheme that he has in mind, then will something else happen, and shatter the doubts of sceptics, like the celestial fire upon the altar of Elijah.

And do not overlook the fact that the pragmaticist maxim says nothing of single experiments or of single experimental phenomena (for what is conditionally true *in futuro* can hardly be singular), but only speaks of *general kinds* of experimental phenomena. Its adherent does not shrink from speaking of general objects as real, since whatever is true represents a real. Now the laws of nature are true.

The rational meaning of every proposition lies in the future. How so? The meaning of a proposition is itself a proposition. Indeed, it is no other than the very proposition of which it is the meaning: it is a translation of it. But of the myriads of forms into which a proposition may be translated, what is that one which is to be called its very meaning? It is, according to the pragmaticist, that form in which the proposition becomes applicable to human conduct, not in these or those special circumstances, nor when one entertains this or that special design, but that form which is most directly applicable to self-control under every situation, and to every purpose. This is why he locates the meaning in future time; for future conduct is the only conduct that is subject to self-control. But in order that that form of the proposition which is to be taken as its meaning should be applicable to every situation and to every purpose upon which the proposition has any bearing, it must be simply the general description of all the experimental phenomena which the assertion of the proposition virtually predicts. For an experimental phenomenon is the fact asserted by the proposition that action of a certain description will have a certain kind of experimental result; and experimental results are the only results that can affect human conduct. No doubt, some unchanging idea may come to influence a man more than it had done; but only because some

experience equivalent to an experiment has brought its truth home to him more intimately than before. Whenever a man acts purposively, he acts under a belief in some experimental phenomenon. Consequently, the sum of the experimental phenomena that a proposition implies makes up its entire bearing upon human conduct. Your question, then, of how a pragmaticist can attribute any meaning to any assertion other than that of a single occurrence is substantially answered.

Questioner: I see that pragmaticism is a thorough-going phenomenalism. Only why should you limit yourself to the phenomena of experimental science rather than embrace all observational science? Experiment, after all, is an uncommunicative informant. It never expatiates: it only answers "yes" or "no"; or rather it usually snaps out "No!" or, at best, only utters an inarticulate grunt for the negation of its "no." The typical experimentalist is not much of an observer. It is the student of natural history to whom nature opens the treasury of her confidence, while she treats the cross-examining experimentalist with the reserve he merits. Why should your phenomenalism sound the meagre jews-harp of experiment rather than the glorious organ of observation?

Pragmaticist: Because pragmaticism is not definable as "thorough-going phenomenalism," although the latter doctrine may be a kind of pragmatism. The *richness* of phenomena lies in their sensuous quality. Pragmaticism does not intend to define the phenomenal equivalents of words and general ideas, but, on the contrary, eliminates their sential element, and endeavors to define the rational purport, and this it finds in the purposive bearing of the word or proposition in question.

Questioner: Well, if you choose so to make Doing the Be-all and the End-all of human life, why do you not make meaning to consist simply in doing? Doing has to be done at a certain time upon a certain object. Individual objects and single events cover all reality, as everybody knows, and as a practicalist ought to be the first to insist. Yet, your meaning, as you have described it, is *general*. Thus, it is of the nature of a mere word and not a reality. You say yourself that your meaning of a proposition is only the same proposition in another dress. But a practical man's meaning is the very thing he means. What do you make to be the meaning of "George Washington"?

Pragmaticist: Forcibly put! A good half dozen of your points must certainly be admitted. It must be admitted, in the first place, that if pragmaticism really made Doing to be the Be-all and the End-all of life, that would be its death. For to say that we live for the mere sake of action, as action, regardless of the thought it carries out, would be to say that there is no such thing as rational purport. Secondly, it must be admitted that every proposition professes to be true of a certain real individual object, often the environing universe. Thirdly, it must be admitted that pragmaticism fails to furnish any translation or meaning of a proper name, or other designation of an individual object.

Fourthly, the pragmaticistic meaning is undoubtedly general; and it is equally indisputable that the general is of the nature of a word or sign. Fifthly, it must be admitted that individuals alone exist; and sixthly, it may be admitted that the very meaning of a word or significant object ought to be the very essence or reality of what it signifies. But when, those admissions having been unreservedly made, you find the pragmaticist still constrained most earnestly to deny the force of your objection, you ought to infer that there is some consideration that has escaped you. Putting the admissions together, you will perceive that the pragmaticist grants that a proper name (although it is not customary to say that it has a *meaning*) has a certain denotative function peculiar, in each case, to that name and its equivalents; and that he grants that every assertion contains such a denotative or pointing-out function. In its peculiar individuality, the pragmaticist excludes this from the rational purport of the assertion, although *the like* of it, being common to all assertions, and so, being general and not individual, may enter into the pragmaticistic purport. Whatever exists, *ex-sists*, that is, really acts upon other existents, so obtains a self-identity, and is definitely individual. As to the general, it will be a help to thought to notice that there are two ways of being general. A statue of a soldier on some village monument, in his overcoat and with his musket, is for each of a hundred families the image of its uncle, its sacrifice to the union. That statue, then, though it is itself single, represents any one man of whom a certain predicate may be true. It is *objectively* general. The word "soldier," whether spoken or written, is general in the same way; while the name, "George Washington," is not so. But each of these two terms remains one and the same noun, whether it be spoken or written, and whenever and wherever it be spoken or written. This noun is not an existent thing: it is a *type*, or *form*, to which objects, both those that are externally existent and those which are imagined, may *conform*, but which none of them can exactly be. This is subjective generality. The pragmaticistic purport is general in both ways.

As to reality, one finds it defined in various ways; but if that principle of terminological ethics that was proposed be accepted, the equivocal language will soon disappear. For *realis* and *realitas* are not ancient words. They were invented to be terms of philosophy in the thirteenth century, and the meaning they were intended to express is perfectly clear. That is *real* which has such and such characters, whether anybody thinks it to have those characters or not. At any rate, that is the sense in which the pragmaticist uses the word. Now, just as conduct controlled by ethical reason tends toward fixing certain habits of conduct, the nature of which (as to illustrate the meaning, peaceable habits and not quarrelsome habits) does not depend upon any accidental circumstances, and *in that sense*, may be said to be *destined*; so, thought, controlled by a rational experimental logic, tends to the fixation of certain opinions, equally destined, the nature of which will be the same in the end,

however the perversity of thought of whole generations may cause the postponement of the ultimate fixation. If this be so, as every man of us virtually assumes that it is, in regard to each matter the truth of which he seriously discusses, then, according to the adopted definition of "real," the state of things which will be believed in that ultimate opinion is real. But, for the most part, such opinions will be general. Consequently, *some* general objects are real. (Of course, nobody ever thought that *all* generals were real; but the scholastics used to assume that generals were real when they had hardly any, or quite no, experiential evidence to support their assumption; and their fault lay just there, and not in holding that generals could be real.) One is struck with the inexactitude of thought even of analysts of power, when they touch upon modes of being. One will meet, for example, the virtual assumption that what is relative to thought cannot be real. But why not, exactly? *Red* is relative to sight, but the fact that this or that is in that relation to vision that we call being red is not *itself* relative to sight; it is a real fact.

Not only may generals be real, but they may also be *physically efficient*, not in every metaphysical sense, but in the common-sense acception in which human purposes are physically efficient. Aside from metaphysical nonsense, no sane man doubts that if I feel the air in my study to be stuffy, that thought may cause the window to be opened. My thought, be it granted, was an individual event. But what determined it to take the particular determination it did was in part the general fact that stuffy air is unwholesome, and in part other *Forms*, concerning which Dr. Carus has caused so many men to reflect to advantage, – or rather, *by* which, and the general truth concerning which Dr. Carus's mind was determined to the forcible enunciation of so much truth. For truths, on the average, have a greater tendency to get believed than falsities have. Were it otherwise, considering that there are myriads of false hypotheses to account for any given phenomenon, against one sole true one (or if you will have it so, against every true one), the first step toward genuine knowledge must have been next door to a miracle. So, then, when my window was opened, because of the truth that stuffy air is malsain, a physical effort was brought into existence by the efficiency of a general and non-existent truth. This has a droll sound because it is unfamiliar; but exact analysis is with it and not against it; and it has, besides, the immense advantage of not blinding us to great facts, – such as that the ideas "justice" and "truth" are, notwithstanding the iniquity of the world, the mightiest of the forces that move it. Generality is, indeed, an indispensable ingredient of reality; for mere individual existence or actuality without any regularity whatever is a nullity. Chaos is pure nothing.

That which any true proposition asserts is *real*, in the sense of being as it is regardless of what you or I may think about it. Let this proposition be a general conditional proposition as to the future, and it is a real general such as is calculated really to influence human conduct; and such the pragmaticist holds to be the rational purport of every concept.

Accordingly, the pragmaticist does not make the *summum bonum* to consist in action, but makes it to consist in that process of evolution whereby the existent comes more and more to embody those generals which were just now said to be *destined*, which is what we strive to express in calling them *reasonable*. In its higher stages, evolution takes place more and more largely through self-control, and this gives the pragmaticist a sort of justification for making the rational purport to be general.

There is much more in elucidation of pragmaticism that might be said to advantage, were it not for the dread of fatiguing the reader. It might, for example, have been well to show clearly that the pragmaticist does not attribute any different essential mode of being to an event in the future from that which he would attribute to a similar event in the past, but only that the practical attitude of the thinker toward the two is different. It would also have been well to show that the pragmaticist does not make Forms to be the *only* realities in the world, any more than he makes the reasonable purport of a word to be the only kind of meaning there is. These things are, however, implicitly involved in what has been said. There is only one remark concerning the pragmaticist's conception of the relation of his formula to the first principles of logic which need detain the reader.

Aristotle's definition of universal predication, which is usually designated (like a papal bull or writ of court, from its opening words) as the *Dictum de omni*, may be translated as follows: "We call a predication (be it affirmative or negative) *universal*, when, and only when, there is nothing among the existent individuals to which the subject affirmatively belongs, but to which the predicate will not likewise be referred (affirmatively or negatively, according as the universal predication is affirmative or negative)." The Greek is: *λέγομεν δὲ τὸ κατὰ παντὸς κατηγορεῖσθαι ὅταν μηδὲν ᾖ λαβεῖν τῶν τοῦ ὑποκειμένου καθ' οὗ θάτερον οὐ λεχθήσεται· καὶ τὸ κατὰ μηδενὸς ὡσαύτως*. The important words "existent individuals" have been introduced into the translation (which English idiom would not here permit to be literal); but it is plain that existent individuals were what Aristotle meant. The other departures from literalness only serve to give modern English forms of expression. Now, it is well known that propositions in formal logic go in pairs, the two of one pair being convertible into another by the interchange of the ideas of antecedent and consequent, subject and predicate, etc. The parallelism extends so far that it is often assumed to be perfect; but it is not quite so. The proper mate of this sort to the *Dictum de omni* is the following definition of affirmative predication: We call a predication *affirmative* (be it universal or particular) when, and only when, there is nothing among the sensational effects that belong universally to the predicate which will not be (universally or particularly, according as the affirmative predication is universal or particular) said to belong to the subject. Now, this is substantially the essential propo-

sition of pragmaticism. Of course, its parallelism to the *Dictum de omni* will only be admitted by a person who admits the truth of pragmaticism.

* * *

Suffer me to add one word more on this point. For if one cares at all to know what the pragmaticist theory consists in, one must understand that there is no other part of it to which the pragmaticist attaches quite as much importance as he does to the recognition in his doctrine of the utter inadequacy of action or volition or even of resolve or actual purpose, as materials out of which to construct a conditional purpose or the concept of conditional purpose. Had a purposed article concerning the principle of continuity and synthetising the ideas of the other articles of a series in the early volumes of *The Monist* ever been written, it would have appeared how, with thorough consistency, that theory involved the recognition that continuity is an indispensable element of reality, and that continuity is simply what generality becomes in the logic of relatives, and thus, like generality, and more than generality, is an affair of thought, and is the essence of thought. Yet even in its truncated condition, an extra-intelligent reader might discern that the theory of those cosmological articles made reality to consist in something more than feeling and action could supply, inasmuch as the primeval chaos, where those two elements were present, was explicitly shown to be pure nothing. Now, the motive for alluding to that theory just here is, that in this way one can put in a strong light a position which the pragmaticist holds and must hold, whether that cosmological theory be ultimately sustained or exploded, namely, that the third category, – the category of thought, representation, triadic relation, mediation, genuine thirdness, thirdness as such, – is an essential ingredient of reality, yet does not by itself constitute reality, since this category (which in that cosmology appears as the element of habit) can have no concrete being without action, as a separate object on which to work its government, just as action cannot exist without the immediate being of feeling on which to act. The truth is that pragmaticism is closely allied to the Hegelian absolute idealism, from which, however, it is sundered by its vigorous denial that the third category (which Hegel degrades to a mere stage of thinking) suffices to make the world, or is even so much as self-sufficient. Had Hegel, instead of regarding the first two stages with his smile of contempt, held on to them as independent or distinct elements of the triune Reality, pragmaticists might have looked up to him as the great vindicator of their truth. (Of course, the external trappings of his doctrine are only here and there of much significance.) For pragmaticism belongs essentially to the triadic class of philosophical doctrines, and is much more essentially so than Hegelianism is. (Indeed, in one passage, at least, Hegel alludes to the triadic form of his exposition as to a mere fashion of dress.)

POSTSCRIPT. During the last five months, I have met with references to several objections to the above opinions, but not having been able to obtain the text of these objections, I do not think I ought to attempt to answer them. If gentlemen who attack either pragmatism in general or the variety of it which I entertain would only send me copies of what they write, more important readers they could easily find, but they could find none who would examine their arguments with a more grateful avidity for truth not yet apprehended, nor any who would be more sensible of their courtesy.

PRAGMATICISM

Charles S. Peirce. "Pragmaticism." MS 291, summer 1905.

Composed in the summer of 1905, this untitled text is based on the manuscript listed as MS 291 in Richard S. Robin's *Annotated Catalogue of the Papers of Charles S. Peirce* and preserved in the Houghton Library, Harvard University. The first page of the manuscript is no longer extant.

DOCTOR X. The best of your screed in the April *Monist* was about the singleness of symbols. It is in truth bad morals to use words in other than their original senses. But apply this rule to your own use of the verb "is." When the child first uses this verb, he applies it to some *sensory* reality. How, then, in the face of your code of terminological ethics, do you ever dare to use the verb "to be" for indicating anything not sensory? I, for my part, stick to the *one* meaning of "is" rigidly. When you talk of "general objects being real," and the like, you seem not to be aware that the verbs "to be," "to be real," and "to exist" have *ever* precisely one and the same significance.

PRAGMATICIST. My statements today are not designed to answer objections, but merely to correct misapprehensions. However, as your objection seems motived by a grave misapprehension, I had better set *that* right. Only in order to guard against my misapprehending *you* in my turn, let me ask you whether you mean to say that throughout that vast philosophical "treatise" of yours, the signification of the verb "is" *is* really and truly in every instance the same.

DOCTOR X. It is.

PRAGMATICIST. And everywhere that meaning is "is real"?

DOCTOR X. Yes.

PRAGMATICIST. Thanks. Then the misapprehension that motives your objection is that you understand me to be more of a scholastic realist than you are, while in fact it is the other way. For this signification of "is," which occurs in hundreds of instances in your book, and is everywhere one and the same, by virtue of that fact satisfies the definition of a general, or, as the scholastics more accurately said, of a universal; and you tell me that when you say that that universal "is" *is* always the same, you mean that it "is real" everywhere, as well as the same. So that makes you a scholastic realist. But you go much further than that; for when you say that the signification *is* the same, you of course make this signification the subject of the verb "is," which according to your

statement is equivalent to a declaration that this signification which is one and the same in so many places of your book is a *sensory* object. Not Bernardus Carnotensis himself, who seems like you to have combined scholastic realism with individualism, went to the length of making any general a sensory object.

DOCTOR X. Now you are quibbling, you know.

PRAGMATICIST. Do not answer me, I beg. For remember that you, Doctor X, – like Y, Z, and W, – are not an existent individual, even if you are a sensory object, but only a general type, – unless indeed you are a mere man of straw. A reply could only vindicate you by showing that you were not a real type, when you would prove yourself to be a man of straw; in which case I might be provoked into the personality of burning you up, in our good old medieval fashion; – though I believe you limit yourself to roasting your antagonists. For my part, I have found the combustion of a man of straw one of the best means of stopping my logical chimney from smoking; while your doctrine would seem to debar you from the employment of that useful device. It is perhaps true that the sectators of individualism, the essence of whose doctrine is that reality and existence are coëxtensive, i.e., are either alike true or alike false of every subject, must, to be logical, go along with you in holding that 'real' and 'existent' have the same meaning, or *Inhalt*. But many a logician, as soon as he is convinced that that party is under that obligation (individualism furnishing the principle of the consequency as well as furnishing the antecedent) would regard that circumstance as creating a *reductio ad absurdum* of individualism, inasmuch as *reality* means a certain kind of nondependence upon thought, and so is a cognitionary character, while *existence* means reaction with the environment, and so is a dynamic character; and accordingly the two meanings, he would say, are clearly *not* the same. Individualists are apt to fall into the almost incredible misunderstanding that all other men are individualists, too, – even the scholastic realists, who, they suppose, thought that "universals exist." It is true that there are indications of there having been some who thought so in that greater darkness before the dawn of Aristotle's *Analytics* and *Topics*, when such grotesque weldings of doctrine as that of nominalistic Platonism are heard of, and when Roscellin may possibly have said that universals were *flatus vocis*. But I ask, Can anybody who has seen Westminster Abbey, who had read the Prologue to the *Canterbury Tales*, and who stops to consider that the metaphysics of the Plantagenet age must have more adequately represented the general intellectual standing of that age, when metaphysics absorbed its greatest heuristic minds, than the metaphysics of our day can represent our general intellectual condition, can any such person believe that the great doctors of that time believed that generals *exist*? They certainly did not so opine, but regarded generals as modes of determination of individuals; and such modes were recognized as being of the nature of thought. Now whoever cares to know what pragmaticism is should understand that on its metaphysical side it is an attempt to solve the problem, In what way can a general be unaffected by any thought

about it? Hence, before we treat of the evidences of pragmaticism, it will be needful to weigh the pros and cons of scholastic realism. For pragmaticism could hardly have entered a head that was not already convinced that there are real generals.

Another misapprehension: You seem to imagine that your argument from the talk of the child will be as convincing to me as it is to you. It is not so, because (aside from "is" not being one of the technical terms to which common sense limited my maxim) I do not think that the import of any word (except perhaps a pronoun) is limited to what is in the utterer's mind *actualiter*, so that when I mention the Greek language my meaning should be limited to such Greek words as I happen to be thinking of at the moment. It is, on the contrary, according to me, what is in the mind, perhaps not even *habitualiter*, but only *virtualiter* which constitutes the import.[1] To say that I hold that the import, or adequate ultimate interpretation, of a concept is contained, not in any deed or deeds that will ever be done, but in a habit of conduct, or general moral determination of whatever procedure there *may come to be*, is no more than to say that I am a pragmaticist. Now every animal must have habits. Consequently, it must have innate habits. In so far as it has cognitive powers, it must have *in posse* innate cognitive habits, which is all that anybody but John Locke ever meant by innate ideas.[2] To say that I hold this for true is implied in my confession of the doctrine of Common Sense, – not quite that of the old Scotch school, but a critical philosophy of common sense. It is impossible rightly to apprehend the pragmaticist's position without fully understanding that nowhere would he be less at home than in the ranks of individualists, whether metaphysical (and so denying scholastic realism), or epistemological (and so denying innate ideas).

DOCTOR Y. Allow me: you speak of holding a *Critical Philosophy of Common Sense*. What meaning would you have me attach to that phrase, seeing that Critical Philosophy and the Philosophy of Common Sense, the two rival and opposed ways of answering Hume, are at internecine war, impacificable. The Common Sense philosopher opines that, be Criticism never so indefatigable, it will have to come to a halt somewhere, and leave some belief uncriticized; namely, wherever no stimulus to doubt has ever been experienced. An uncriticized belief must, says the Common-sensist, *ipso facto* be

[1] This was said in 1868, before declaring for pragmaticism, thus: "No present actual thought (which is mere feeling) has any meaning, any intellectual value; for this lies, not in what is actually thought, but in what this thought may be connected with in representation by subsequent thoughts; so that the meaning of a thought is altogether something virtual." (*J. Spec. Phil.*, Vol. II, p. 149). This paper in fact expresses a kind of pragmatism not unlike that of Professor James.

[2] How surprisingly, however, Locke grew in philosophical power during the composition of the *Essay concerning Humane Understanding*!

regarded as the very truth. That sounds conclusive. Yet it does not satisfy any of the Criticists, at all, – be they Kantians or be they of one of the modern kinds that do not usually go by the name of Criticists. That a belief should be accepted as the bed-rock of truth simply and solely because it has not been criticized, – oh, this is to their minds too monstrous! They insist that first principles be scientifically established. To think otherwise, says the great Wundt, is to ask that philosophy should come into being by *equivocal generation*. He so resuscitates the phrase which, in the days when men believed in armary unguents, in mummial philtres, and in sigillary medicines, denoted the manner in which they thought that Satan's flies and the vilest of crawling things could be produced, in order to hint how much out of good odor common sense is in his estimation. Of a principle proposed for the foundation of philosophy, think the Criticists, it must either be proved that the very circumstances and form of human knowledge require its acceptance, or better, that scientific psychology should show that its truth is unavoidable, or still better, that physiology should support it as it supports parallelism, or best of all, that histology should almost bring it within the field of the microscope, as caryocinesis is supposed almost to give ocular demonstration of some high proposition. Now, without asking whether it be Common Sense or one of the Critical methods that is *right*, one cannot help seeing that Criticism and Common Sense are so immiscible that to plunge into either is to lose all touch with the other. The Criticist believes in criticizing first principles, while the Common Sensist thinks such criticism is all nonsense. So I can find no meaning in your straddling phrase.

PRAGMATICIST. The phrase denotes a particular stripe of Common-sensism, which is separated from the old Scotch kind by four distinguishing marks. The mark that I find it convenient to describe first is that the Critical Commonsensist holds that all the veritably indubitable beliefs are *vague*, – often in some directions highly so.

Logicians have too much neglected the study of *vagueness*, not suspecting the important part it plays in mathematical thought. It is the antithetical analogue of generality. A sign is objectively *general*, in so far as, leaving its effective interpretation indeterminate, it surrenders to the interpreter the right of completing the determination for himself. "Man is mortal." "What man?" "Any man you like." A sign is objectively *vague*, in so far as, leaving its interpretation more or less indeterminate, it reserves for some other possible sign or experience the function of completing the determination. "This month," says the almanac-oracle, "a great event is to happen." "What event?" "Oh, we shall see. The almanac doesn't tell that."[3] The *general* might be defined as that to which the

[3] This is illustrated in our use of the phrase "a *certain* man," which means that the determination which is left *uncertain* to the reader or auditor is, nevertheless, or once was, *certain* either to the utterer or to some other person.

principle of excluded middle does not apply. A triangle in general is not isosceles nor equilateral; nor is a triangle in general scalene. The *vague* might be defined as that to which the principle of contradiction does not apply. For it is false neither that an animal (in a vague sense) is male, nor that an animal is female. Mr. Kempe's great memoir in the *Philosophical Transactions* for 1886, the most solid piece of work upon any branch of the stecheology of relations that has ever been done, in addition to its intrinsic value, has that of taking us out of the logician's rut, and showing us how the mathematician conceives of logical objects. Thus, in §4, he says that the four angular points of a square "are not distinguishable from" one another. On first reading this, a person who was preoccupied with conceptions derived from logicians, was moved to write to the author and ask whether he did not mean "do not differ" from one another. For if the angles are undistinguished, how do we know there are more than one of them? But though some suggestions of the letter were adopted in a supplement to the memoir, Mr. Kempe stood to "undistinguished" and "undistinguishable"; and in §29 he is more explicit, saying of the units of a singulary[4] system of units (i.e., a system all whose units are undistinguished from one another), "that no definition can be given of, or remark made about, one which is not equally applicable to each of the others." In §73, he goes further in using the expression "undistinguished in dress or other circumstance," showing that he means to exclude distinction by means of relations. All this is utterly paradoxical to the logician, who will say that two vertices of a square are distinguished from each other in not being opposite the same vertex, and in various other ways. But the difficulty disappears as soon as he recognizes that Kempe's units are not supposed to be real objects, but are only *vague* ideas, to which nobody ever supposed the principle of contradiction to apply.

Notwithstanding their contrariety, generality and vagueness are, from a formal point of view, seen to be on a par. Evidently no sign can be at once vague and general in the same respect, since in so far as the right of determination is not distinctly extended to the interpreter it remains the right of the utterer. Hence also, a sign can only escape from being either vague or general by not being indeterminate. But that no sign can be absolutely and completely indeterminate is proved in *Memoirs of the American Academy of Arts and Sciences*, Vol. IX, 1870 (p. 27) where Plutarch's anecdote about appealing from Phillip drunk to Phillip sober is put to use. Yet every proposition actually asserted must refer to some non-general subject; for the doctrine that a proposition has but a single subject has to be given up in the light of the Logic of Relations. (See *The Open Court* for 1892 Oct. 13, Vol. VI, pp. 3416

[4] Kempe's word is 'single'; but I prefer 'singulary', from Latin *singularius*, not from *singularis*. His §127 throws further light on his meaning of "undistinguished."

et seq.) Indeed, all propositions refer to one and the same determinately singular subject, well-understood between all utterers and interpreters; namely, to The Truth, which is the universe of all universes, and is assumed on all hands to be real. But besides that, there is some lesser environment of the utterer and interpreter of each proposition that actually gets conveyed, to which that proposition more particularly refers, and which is not general. The *Open Court* paper referred to made this plain, but left unnoticed some truths of the first importance about vagueness. No communication of one person to another can be entirely definite, i.e., non-vague. We may reasonably hope that physiologists will some day find some means of comparing the qualities of one person's feelings with those of another, so that it would not be fair to insist upon their present incomparability as an inevitable source of misunderstanding. Besides, it does not affect the intellectual purport of communications. But wherever degree or any other possibility of continuous variation subsists, absolute precision is impossible. Much else must be vague, because no man's interpretation of words is based on exactly the same experience as any other man's. Even in our most intellectual conceptions, the more we strive to be precise, the more unattainable precision seems. It should never be forgotten that our own thinking is carried on as a dialogue, and though mostly in a lesser degree, is subject to almost every imperfection of language. I have worked out the logic of vagueness with something like completeness, but need not inflict more of it upon you, at present.

That veritably indubitable beliefs are especially vague could be proved *a priori*. But proof not being aimed at today, it will be simpler to say that the Critical Common-sensist's personal experience is that a suitable line of reflexion accompanied by imaginary experimentation always excites doubt of any very broad proposition if it be defined with precision. Yet there are beliefs of which such a critical sifting invariably leaves a certain vague residuum unaffected. One ought then to ask oneself, whether, since much of the original belief has disappeared under an attentive dissection, perseverance might not effect the destruction of what remains of it. This question always appears reasonable as long as one stands far enough away from the facts of the case, and views them as one would a painting of Monet.

But the answer that a closer scrutiny dictates in some cases is that it is not because insufficient pains have been taken to precide[5] the residuum, that it

[5] Meaning to render precise, that is, non-vague, non-indefinite. The word is intended to cover, but not to be tied down to, the usual acception of the French *préciser*, which ought to have been *précider*, like *décider*. Latin is not so rich in stems suited to the purposes of philosophical terminology that we can afford to waste any of them; and we should, and all do, endeavor to restrict the resort to Greek to cases where a more highly technical word is wanted. Now the present employment of the two Latin verbs *praecidere* and

is vague: it is that it is vague intrinsically. Take for example our belief in the Order of Nature. The criticisms of it in *J. Spec. Ph.* (p. 204), in *Pop. Sci. M.* (XIII pp. 203–217), *J. H. Studies* (pp. 175–181), *Monist* (II pp. 321–337, III pp. 561–567), as well as by various other writers of whom may be mentioned as long antecedent to the writer, Renouvier, Delboeuf, Fouillée, Blood, and James, and no doubt there were others, and since that time Dewey and I know not who else, appear to me to have stripped it of all rational precision. As precisely defined it can hardly be said to be absolutely indubitable considering how many thinkers there are who do not believe it. But who can think that there is *no* order in nature?

Could I be assured that other men candidly and with sufficient deliberation doubt any proposition which I regard as indubitable, that fact would inevitably cause me to doubt it, too. I ought not, however, lightly to admit that they do so doubt a proposition after the most thorough criticism by myself and anxious consideration of any other criticisms which I have been able to find and understand has left it quite indubitable by me, since there are other states of mind that can easily be mistaken for doubt. If, indeed, the phenomenon in question were at all a common one, instead of being among the rarest of experiences, I should return to a variety of Common-sensism which has always strongly attracted me, namely, that there is no definite and fixed collection of opinions that are indubitable, but that criticism gradually pushes back each individual's indubitables, modifying the list, yet still leaving him beliefs indubitable at the time being. The reason I have of late given up that opinion, attractive as I find it, is that the facts of my experience accord better with the theory of a fixed list, the same for all men. I do not suppose that it is absolutely fixed (for my synechism would revolt at that), but that it is so nearly so, that for ordinary purposes it may be taken as quite so.

Doubt is a state of mind marked by a feeling of uneasiness; but we cannot, from a logical, least of all from a pragmaticistic point of view, regard the

praescindere in our English nomenclature is shockingly wasteful. *Prescind* is a good word in the sense explained in *Proceedings of the American Academy of Arts and Sciences*, Vol. VII, 1867 (p. 289); but instead of forming the derivates *presciss*, *prescission*, etc., writers have hitherto either deflected *precise*, *precision*, etc. from their very different and well-established meanings, or they have got along without any such words, which is embarrassing to writer and reader.

The use of *presciss*, *prescission*, etc. will somewhat relieve the burden upon *abstract*, that unfortunate stem, which is cursed with two remote meanings of equal authority. Writers ought, at any rate, never to use it without stopping to consider carefully whether they have made it quite clear to which kind of abstraction they refer, the *prescissive* (when in nine cases out of ten it would have been better to use one of the derivates of *praescindere*, and in the tenth to explain oneself more fully), or the *hypostatic*. The latter might be called *substantivization*; but *substantivizative* and *substantivizational* are fearful expressions for matters that in logic stand in the first rank of importance.

doubt as consisting in the feeling. A man in doubt is usually trying to imagine how he shall, or should, act when or if he finds himself in the imagined situation. He supposes himself to have an end in view, and two different and inconsistent lines of action offer themselves. His action is in imagination (or perhaps really) brought to a stop because he does not know whether (so to speak) the right hand road or the left hand road is the one that will bring him to his destination; and (to continue the figure of speech) he waits at the fork for an indication, and kicks his heels. His pent up activity finds vent in feeling, which becomes the more prominent from his attention being no longer absorbed in action. A true doubt is accordingly a doubt which really interferes with the smooth working of the belief-habit. Every natural or inbred belief manifests itself in natural or inbred ways of acting, which in fact constitute it a belief-habit. [I need not repeat that I do not say that it is the single deeds that constitute the habit. It is the single "ways," which are conditional propositions each general.] A true doubt of such a belief must interfere with this natural mode of acting. If a philosophist, reflecting upon the belief from an extraneous or unnatural point of view, develops new modes of manifestation of that belief (as, for example, by associating it with certain phrases), these new habits must not be regarded as expressions of the natural belief *simply*; for they inevitably involve something more. Consequently, if subsequent reflexion results in doubt of them, it is not necessarily doubt of the original belief, although it may be mistaken for such doubt.

These considerations lead me, quite naturally, to mention another mark of the Critical Common-sensist that separates him from the old school. Namely, he opines that the indubitable beliefs refer to a somewhat primitive mode of life, and that, while they never become dubitable in so far as our mode of life remains that of somewhat primitive man, yet as we develop *degrees of self-control* unknown to that man, occasions of action arise in relation to which the original beliefs, if stretched to cover them, have no sufficient authority. In other words, we outgrow the applicability of instinct, – not altogether, by any manner of means, but in our highest activities. The famous Scotch philosophers lived and died out before this could be duly appreciated.

DOCTOR Y. What do you mean by "somewhat primitive"? And by what sort of reasoning can a dubitable proposition about experience become indubitable?

PRAGMATICIST. A searching question, because some of our beliefs which seem as indubitable as any are of such a character that they can hardly have entered the minds, say, of Neanderthal men, and in any case, cannot possibly have been transmitted to us from the first conscious animals. Consequently, Common-sensism has to grapple with the difficulty that if there are any indubitable beliefs, these beliefs must have grown up; and during the process, cannot have been indubitable beliefs. Still, I see no reason for thinking that beliefs that were dubitable became indubitable. Every decent house-dog has

been taught beliefs that appear to have no application to the wild state of the dog; and yet your trained dog has not, I guess, been observed to have passed through a period of scepticism on the subject. There is every reason to suppose that belief came first, and the power of doubting long after. Doubt, usually, perhaps always, takes its rise from surprise, which supposes previous belief; and surprises come with novel environment. I will only add that though precise reasoning about precise experiential doubt could not entirely destroy doubt, any more than the action of finite conservative forces could leave a body in a continuous state of rest, yet vagueness, which is no more to be done away with in the world of logic than friction in mechanics, can have that effect.

As I was saying, a modern recognition of evolution must distinguish the Critical Common-sensist from the old school. Modern science, with its microscopes and telescopes, with its chemistry and electricity, and with its entirely new appliances of life, has put us into quite another world; – almost as much so as if it had transported our race to another planet. Some of the old beliefs have no application except in extended senses, and in such extended senses they are sometimes dubitable and subject to just criticism. It is above all the normative sciences, esthetics, ethics, and logic, that men are in dire need of having severely criticized in their relation to the new world created by science. Unfortunately, this need is as unconscious as it is great. The evils are in some superficial way recognized; but it never occurs to anybody that the study of esthetics, ethics, and logic can be seriously important, because these sciences are conceived by all but their deepest students in the old way. It only concerns my present purpose to glance at this state of things. The needed new criticism must know whereon it stands; namely, on the beliefs that remain indubitable; and young Critical Common-sensists of intellectual force who burn for a task in which they can worthily sacrifice their lives without encouragement, reward, recognition, or a hearing (and I trust such young men still live) can find in this field their heart's desire.

Yet a third mark of the Critical Common-sensist is that he has a high esteem for doubt. He may almost be said to have a *sacra fames* for it. Only, his hunger is not to be appeased with paper doubts: he must have the heavy and noble metal, or else belief.

He quite acknowledges that what has been indubitable one day has often been proved on the morrow to be false. He grants the presciss proposition that it may be so with any of the beliefs he holds. He really cannot admit that it may be so with all of them; but here he loses himself in vague unmeaning contradictions.

DOCTOR Y. Can indubitable propositions be demonstrable?

PRAGMATICIST. Indubitable propositions must be ultimate premisses, or at least, must be held without reference to precise proofs. For what one cannot doubt one cannot argue about; and no precise empirical argument can free its conclusion altogether from rational doubt.

Yet it is true that whenever one turns a critical glance upon one of our original beliefs, – say, the belief in the order of nature, – the mind at once seems vaguely to pretend to have reasons for believing it. One dreams of an inductive proof. One surmises that the belief results from something like an inductive proof that has been forgotten. Very likely it did, in a sense of the term "inductive process" that is so generalized as to include uncontrolled thought. But this admission must be accompanied by the emphatic denial that the indubitable belief is inferential, or is "accepted." It simply remains unshaken as it always was. That does not at all interfere with the theory that in the psychological process of its development, the occurrence of single experiences, such as might have been predictively deduced from it, were an indispensible factor, while an original potentiality of the belief-habit must have been a correlative factor. All this is perfectly consistent, too, with the necessity of criticizing the ordinary axioms of reasoning and of morals, as well as ordinarily developed ideals, as soon as they are extended so as to become applicable to the new world created by science.

I was saying that the Critical Common-sensist feels that the danger, – the scientific danger, at any rate; and Philosophy is a department of pure Heuretic Science even less concerned, for example, about practical religion, if possible, than religion ought to be about it, – does not lie in believing too little but in believing too much. The indolent university student, no matter at what pains his professor of philosophy may be to set him upon his own legs, yet having a well-grounded respect for that professor's superior acquirements and force of intellect, finds it much easier to accept all he says, as true because he says it, than to submit said professor's arguments to searching criticism; and he thus becomes, on the average, quite as much a slave to authority as was the average scholar of the medieval schools. Only, instead of bowing to Aristotle and the universal voice of the church sounding *semper eadem*, he submits to the yoke of some young doctrinaire with whom every other like him disagrees. With such sentiments, the Critical Common-sensist sets himself in serious earnest to the systematic business of endeavoring to bring all his very general first premisses to recognition, and of developing every suspicion of doubt of their truth, by the use of logical analysis, and by experimenting in imagination. If, besides being a Critical Common-sensist, he is also a pragmaticist, he will further hold that everything in the substance of his beliefs can be represented in the schemata of his imagination; that is to say, in what may be compared to composite photographs of continuous series of modifications of images; these composites being accompanied by conditional resolutions[6] as to conduct.

[6] By a *categorical resolution* I mean a representation to oneself that one will behave in a certain general way in a certain expected contingency, this representation being received with satisfaction, being rehearsed with pleasure, and perhaps exciting a special effort to learn it as a lesson. The purpose toward the accomplishment of which the action tends

These resolutions should cover all classes of circumstances, in the sense that they would produce (or, *perhaps*[7] more strictly, are manifestations of whatever it may be in our occult nature that produces) determinations of habit corresponding to every possible pragmaticistic application of the propositions believed.

Pragmaticism is, of course, in its developed fulness, too recent a phenomenon in the history of philosophy to have disclosed anything to direct experience concerning its tendencies that is particularly trustworthy. Thus far, however, it would appear that, as a matter of fact, pragmaticists press their peculiar doubts about first principles a good deal further and with a more straightforward earnestness than Kantians do. For when a Kant expresses a doubt, one has still to learn whether it is the substance of the proposition that he doubts or merely its attachment to one faculty or to another. One has even known of a pragmaticist being called by a Kantian "David Hume Redivivus"; but I fancy it was more like the David Hume of some mediumistic *séance*.

DOCTOR X. I should think that so passionate a lover of doubt would make a clean sweep of his beliefs.

PRAGMATICIST. You naturally would, holding the infant's mind to be a *tabula rasa* and the adult's a school slate, on which doubts are written with a soapstone pencil to be cleaned off with the dab of a wet sponge; but if they are marked with talc on man's "glassy essence," they may disappear for a long time only to be revived by a breath.

DOCTOR X. Yours seemed marked with t-a-l-k. Doubtless your pragmaticist dotes too much on doubt to risk subjecting it to scientific experimentation.

PRAGMATICIST. Bah! I may as well capitulate first as last. I have been betrayed by that execrable banality, *auri sacra fames*, which is not even good poetry, since it is inaccurate. For what it *expresses* is the hoarding passion of the miser, a sort of collector's rage for gold as gold, while all it *means* in the familiar passages is no more than simple cupidity; and that is what I meant in applying it to the Critical Common-sensist's eager pursuit of doubt. He is none of those overcultivated Oxford dons, – I hope their day is over, – whom any discovery that brought quietus to a vexed question would evidently vex because it would end the fun of arguing around it and about it and over it. On the contrary what he adores, if he is a good pragmaticist, is *power*; – not

is taken for granted. By a *conditional resolution*, I mean a similar representation except that the purpose or end in view is only arbitrarily supposed to be aimed at and the circumstances under which the action would take place are not generally expected to arise. By a *conditional habit*, I mean a determination of a man's occult nature tending to cause him to act in a certain general way in case certain general circumstances should arise and in case he should be animated by a certain purpose.

[7] Were it a question of brute force, there were no need of the perhaps. But being a logos-influence, the manifest would promise more efficiency than the occult.

the sham power of brute force, which, even in its own specialty of spoiling things, secures such slight results; but the creative power of reasonableness, which subdues all other powers, and rules over them with its sceptre, knowledge, and its globe, love. It is as one of the chief lieutenants of reasonableness that he highly esteems doubt, although it is not amiable.

As for allaying doubts concerning the first principles of logic and philosophy by means of scientific experiments, he does not attempt that for two reasons, one a fine little reason that insinuates itself between the joints of the Wundtian armour, the other more like wholesome country air.

The small reason is sufficient. It is that any such idioscopic inquiry must proceed upon the virtual assumption of sundry logical and metaphysical beliefs; and it is rational to settle the validity of those before undertaking an operation that supposes their truth. Now whether the truth of them be explicitly laid down on critical grounds, or the doctrine of Common Sense prevent our pretending to doubt it, along with these all other sound first principles will be admitted, and so the whole inquiry will be concluded before the first outward experiment is made. But this preliminary inquiry is long and arduous.

DOCTOR X. A sort of Panama Commission business, apparently. I should say, Pitch in like Lesseps, unless your second objection is more serious. What is that?

PRAGMATICIST. There is nothing novel in it. It is that nothing is so unerring as instinct within its proper field, while reason goes wrong about as often as right, – perhaps oftener. Now those vague beliefs that appear to be indubitable have the same sort of basis as scientific results have. That is to say, they rest on experience, – on the total everyday experience of many generations of multitudinous populations. Such experience is worthless for distinctively scientific purposes, because it does not make the minute distinctions with which science is chiefly concerned; nor does it relate to the recondite subjects of science, although all science, without being aware of it, virtually supposes the truth of the vague results of uncontrolled thought upon such experiences, cannot help doing so, and would have to shut up shop if she should manage to escape accepting them. No "wisdom" could ever have discovered argon; yet within its proper sphere which embraces objects of universal concern, the instinctive result of human experience ought to have so vastly more weight than any scientific result, that to make laboratory experiments to ascertain, for example, whether there be any uniformity in nature or no would vie with adding a teaspoonful of saccharin to the ocean in order to sweeten it.

DOCTOR Y. Is there any further peculiarity which distinguishes Critical Common-sensism from that of Reid and Dugald Stewart?

PRAGMATICIST. Yes; for it criticizes the critical method, follows its footsteps, tracks it to its lair. To the accusation that Common Sense accepts a proposition as indubitable because it has not been criticized, the answer is that this

confounds two uses of the word "because." Neither the Philosophy of Common Sense nor the man who holds it accepts any belief *on the ground* that it has not been criticized. For, as already said, such beliefs are not "accepted." What happens is that one comes to recognize that one has had the belief-habit as long as one can remember; and to say that no doubt of it has ever arisen is only another way of saying the same thing. But it is quite true that the Common-sensist like everybody else, the Criticist included, believes propositions *because* they have not been criticized in the sense that he does not doubt certain propositions that he would have doubted if he had criticized them. For in the first place, to criticize is *ipso facto* to doubt, and in the second place criticism can only attack a proposition after it has given it some precise sense in which it is impossible entirely to remove the doubt. It is probably true, too, that the Common-sensist believes unquestioningly some propositions that might have been criticized and that are not true. We are all liable to do that; but perhaps he is more in danger of it than other men. Still, as a fact, it is difficult to find a Criticist who does not hold to more fundamental beliefs than any Critical Common-sensist does.

The Critical Philosopher seems to opine that the fact that he has not hitherto doubted a proposition is no reason why he should not henceforth doubt it. [At which Common Sense whispers that, whether it be 'reason' or no, it will be a well-nigh insuperable *obstacle* to doubt.] Accordingly, he will not stop to ask whether he actually does doubt it or not, but at once proceeds to examine it. Now if it happens that he *does* actually doubt the proposition, he does quite right in starting a critical inquiry. But in case he *does not* doubt, he virtually falls into the Cartesian error of supposing that one can doubt at will. A proposition that could be doubted at will is certainly not *believed*. For belief, while it lasts, is a strong habit, and as such, forces the man to believe until some surprise breaks up the habit. The breaking of a belief can only be due to some novel experience, whether external or internal. Now experience which could be summoned up at pleasure would not be experience.

Kant (whom I *more* than admire) is nothing but a somewhat confused pragmatist. A real is anything that is not affected by men's cognitions *about it*; which is a verbal definition and not a doctrine. An external object is anything that is not affected by any cognitions, whether about it or not, of the man to whom it is external. Exaggerate this, in the usual philosopher-fashion, and you have the conception of what is not affected by any cognitions at all. Take the converse of this definition and you have the notion of what does not affect cognition, and in this indirect manner you get a hypostatically abstract notion of what the *Ding an sich* would be. In this sense, we also have a notion of a sky-blue demonstration; but in half a dozen ways the *Ding an sich* has been proved to be nonsensical; and here is another way. It has been shown (*Open Court*, *loc. cit.*) that in the formal analysis of a proposition, after all that words can convey has been thrown into the predicate,

there remains a subject that is indescribable and that can only be pointed at or otherwise indicated, unless a way of finding what is referred to be prescribed. The *Ding an sich*, however, can neither be indicated nor found. Consequently, no proposition can refer to it, and nothing true or false can be predicated of it. Therefore, all references to it must be thrown out as meaningless surplusage. But when that is done, we see clearly that Kant regards Space, Time, and his Categories just as everybody else does, and never doubts or has doubted their objectivity. His limitation of them to possible experience is pragmatism in the general sense; and the pragmaticist, as fully as Kant, recognizes the mental ingredient in these concepts. Only (trained by Kant to define), he defines more definitely, and somewhat otherwise, than Kant did, just how much of this ingredient comes from the mind of the individual in whose experience the cognition occurs. The kind of Commonsensism which thus criticizes the Critical Philosophy and recognizes its own affiliation to Kant has surely a certain claim to call itself Critical Commonsensism.

DOCTOR Z. You say that no collection of individuals could ever be adequate to the extension of a concept in general, which is, of course, the old peripatetic doctrine. But really I do not quite see how you propose to reconcile that to the proposition that the meaning extends no further than to future embodiments of it.

PRAGMATICIST. The original paper on pragmaticism was completed in September 1877[8] and appeared in the *Popular Science Monthly* for January 1878. At that time, modern investigation of the doctrines of multitude had not begun.[9] Indeed, there are indications in that paper of an endless series not being regarded as a collection! Yet the philosophical importance of the new studies was fully recognized by the pragmaticist from the first.[10]

In the *Monist* (Vol. VII, 1897, p. 206 *et seq*.) the objectivity of possibility was asserted; and the hypothesis defended in Vols. I and II supposes possibility to be real. It was, indeed, *implied* in the scholastic realism maintained

[8] This is fixed in the writer's memory by the fact that it was begun after leaving Hoboken on a steamer and was finished a day or two before reaching Plymouth, nothing remaining to be done except to translate it into English. The *Comptes Rendus* of the Europäischer Gradmessung show that on Sep. 29 he was absorbed in quite another discussion in Stuttgart.

[9] It was hardly available for philosophists before June 1883; and was not put into shape even then, Cantor being long occupied, apparently, with his great theory of ordinals, which hardly concerns multitude.

[10] C. S. Peirce's paper "On the Logic of Number," published in the spring of 1881 (*Am. J. Math*. Vol. IV, pp. 85–95) contained, though not in a perspicuous form, the leading results of Dedekind's classic of 1887.

in the *North American Review* (Vol. CXIII, pp. 454 et *seqq.*). But the paper in *Pop. Sci. M.* of Jan. 1878 (Vol. XII, pp. 286–302) evidently endeavors to avoid asking the reader to admit a real possibility. The theory of modality is far too great a question to be treated incidentally to any other. But the distinct recognition of real possibility is certainly indispensible to pragmaticism.

The pragmaticist has always explicitly stated that the intellectual purport of a concept consists in the truth of certain conditional propositions asserting that if the concept be applicable, and the utterer of the proposition or his fellow have a certain purpose in view, he would act in a certain way. A purpose is essentially general, and so is a way of acting; and a conditional proposition is a proposition about a universe of possibility. At the same time, the conditional proposition refers only to possible individual actions. If there be any paradox here, it is partially resolved in the important paper in *The Monist*, Vol. VII, where it is shown that an endless series of experiences, each entirely consistent with those that precede it, cannot itself be experienced (*as* such endless series), but involves a first dose of ideality, or generality. It is not a perfect general, it is true; but the whole endless series of steps from this to true continuity (which is perfect generality elevated to the mode of conception of the Logic of Relations) are there described. Whoever wishes to complete the theory of modality should set out from the results there demonstrated.

The conditional proposition which the pragmaticist holds to constitute the purport of a concept is in the article of Jan. 1878 spoken of as expressing a "fact"; and it does indeed express the actual state of mind of a person who has made, or is ready to make, a resolve, – not a categorical resolve, but a resolve conditional upon having a certain purpose. But nobody would make any difficulty in admitting that every resolve is limited to future acts, and acts are the most perfectly individual objects there are.

I apprehend that I have thus substantially answered your question; but in order to make my answer a little clearer, I will illustrate it by the consideration of the continuity of Space. In this illustration I shall adopt the Leibnizian conception of Space in place of the Newtonian, which I believe to be the true one. In that Leibnizian view, Space is merely a possibility limited by an impossibility; – a possibility of no matter what affections of bodies (determining their relative positions), together with the impossibility of those affections being actualized otherwise than under certain limitations, expressed in the postulates of topical, graphical, and metrical geometry. No collection of points, though it be abnumerable to the billionth degree, could fill a line so that there would be room for no more points; and in that respect the line is truly general; no possible multitude of singulars is adequate to it. Space is thus truly general; and yet it is, so to say, nothing but the way in which actual bodies conduct themselves.

DOCTOR Z. But the idea of Leibnizian Space, if there were such a thing, would not be a concept. It would be a *Vorstellung*, or composite of images. Kant might perhaps have called it a *schema*, since he defines a *schema* as a determination of intuition by a concept through the reproductive imagination. Of course, it would not be one of those *transcendental* schemata, which he talks of in the *Critik*; but it possesses much the same sort of bastard generality.

PRAGMATICIST. The breakneck hurry in which the *C.d.r.V.* was written is its only defence against a charge of slovenly workmanship. Every detail is left in the rough; and there is no more unfinished apartment in the whole glorious edifice than that devoted to the Schematization of the Categories. Kant says that no image, and consequently we may add, no collection of images, is adequate to representing what a schema represents. If that be the case, I should like to know how a schema is not as general as a concept. If I ask him, all he seems to answer is that it is the product of a different "faculty."

But what you would seem to mean by a concept is the meaning of some general symbol, this meaning being conceived as referring to the symbol. Now it is precisely the pragmaticist's contention that symbols, owing their origin (on one side) to human conventions, cannot transcend conceivable human occasions. At any rate, it is plain that no possible collection of single occasions of conduct can be, or adequately represent, *all* conceivable occasions. For there is no collection of individuals of any general description which we could not conceive to receive the addition of other individuals of the same description aggregated to it. The generality of the possible, the only true generality, is distributive, not collective. You perhaps do not see how this remark bears upon your question.

DOCTOR W. I should like to know what the attitude of your pragmaticism is to the question of whether or no valuation is a factor of all intellectual meaning.

PRAGMATICIST. Well, collective and distributive universality can bide their time. Considering how it stood in the mid-channel of pragmatistic thought to join ethics to logic, it seems to me strange that we had to wait until 1903 for any pragmatist to assert that logic ought to be based upon ethics. Perhaps some one of us had said it before; but I only know that it was then said in a course of lectures before the Lowell Institute in Boston, and was maintained on the ground that reasoning is thought subjected to self-control, and that the whole operation of logical self-control takes precisely the same quite complicated course which everybody ought to acknowledge is that of effective ethical self-control. Mr. Schiller in the same year published an essay entitled "The Ethical Basis of Metaphysics." The title is promising, but the essay is, for me, reduced to gibberish by the author's talking about the *real*, without the slightest hint of what he means by this word except that it is something the character of which is affected (and it would seem very greatly) by

anybody's thinking that it possesses or does not possess that character. In short, he treats a verbal definition as a doctrine, and stoutly denying it, leaves the word a mystery for so stupid a reader as me. To meet some such barrier has more than once been my ill-luck in reading this earnest writer, who always seems to have something he is determined to make out, riding roughshod over everything.

To return to self-control, which I have time only slightly to sketch, of course there are inhibitions and coordinations that entirely escape consciousness. As we rather ridiculously say, they are "purely physiological." There are, in the next place, modes of self-control which seem quite instinctive. Next, a man can be his own training-master and thus control his self-control. When this point is reached, much or all the training may be conducted in imagination, quite effectually. When a man trains himself, thus controlling control, he must have in view some rule, in a broad sense moral, special and irrational though it be. But next, he may undertake (on another occasion, of course) to improve upon this rule; that is, to exercise a control over his control of control. To do this he must have in view something higher than an irrational rule. He must have some sort of moral principle. This, in turn, may be controlled by reference to an esthetic ideal of what is fine. There are certainly more grades than I have enumerated. Perhaps their number is indefinite. The brutes are certainly capable of more than one grade of control; but it seems to me that our superiority to them is more due to our greater number of grades of self-control than it is to our versatility.

DOCTOR Y. Is it not due to our faculty of language?

PRAGMATICIST. To my thinking that faculty is itself a phenomenon of self-control. For thinking is a kind of conduct, and is itself controllable, as everybody knows. Now the intellectual control of thinking takes place by thinking about thought. All thinking is by signs; and the brutes use signs. But they perhaps rarely think of them as signs. To do so is manifestly a second step in the use of language. Brutes use language, and seem to exercise some little control over it. But they certainly do not carry this control to anything like the same grade that we do. They do not criticize their thought logically. One extremely important grade of thinking about thought, which my logical analyses have shown to be one of chief, if not the chief, explanation of the power of mathematical reasoning, is a stock topic of ridicule among the wits. This operation is performed when something that one has thought about any subject is itself made a subject of thought. You remember how in the last *Intermède* to the *Malade Imaginaire*, the doctor puts a question to the candidate for the medical degree?

> Si mihi licentiam dat dominus praeses,
> Et tanti docti doctores
> Et assistantes illustres

Très sçavanti bacheliero,
Quem estimo et honoro,
Demandabo causam et rationem quare
Opium facit dormire.

To which the candidate replies,

Mihi a docto doctore
Demandatur causam et rationem quare
Opium facit dormire.
A quoi respondeo,
Quia est in eo
Vertus dormitiva,
Cujus est natura
Sensus assoupire.

Whereupon the chorus bursts out,

Bene, bene, bene, bene respondere.
Dignus, dignus est intrare
In nostro docto corpore.
Bene, bene respondere.

Even in this burlesque instance, this operation of hypostatic abstraction is not quite utterly futile. For it does say that there is *some* peculiarity in the opium to which the sleep must be due; and this is not suggested in merely saying that opium puts people to sleep. By the way, John Locke's account of a real function of this sort at Montpellier three years after the play was first performed with such tragic effect upon Molière shows that there was more truth than caricature in the *Intermède*. In order to get an inkling, – though a very slight one, – of the importance of this operation in mathematics, it will suffice to remember that a *collection* is a hypostatic abstraction, or *ens rationis*, that *multitude* is the hypostatic abstraction derived from a predicate of a collection, and that a *cardinal number* is an abstraction attached to a multitude. So an *ordinal number* is an abstraction attached to a *place*, which in its turn is a hypostatic abstraction from a relative character of a unit of a *series*, itself an abstraction again. Now, Doctor Z, as well as I can make out, what you mean by a *concept* is a predicate considered by itself, except for its connection with the word or other symbol expressing it, and now regarded as denotative of the concept. Such a concept is not merely prescissively abstracted, but, as being made a subject of thought, is hypostatically abstract. So understood, it is true that it is more removed from the perceptual objects than is the *Vorstellung*, or composite of images. But for all that, its intellectual

purport is just the same. It is only the grammatico-logical form that is transmuted.

And you, Doctor W, will see that since pragmaticism makes the purport to consist in a conditional proposition concerning conduct, a sufficiently deliberate consideration of that purport will reflect that the conditional conduct ought to be regulated by an ethical principle, which by further self-criticism may be made to accord with an esthetical ideal. For I cannot admit that any ideal can be too high for a duly transfigured esthetics. So, although I do not think that an esthetic valuation is essentially involved *actualiter* (so to speak) in every intellectual purport, I do think that it is a *virtual* factor of a duly rationalized purport. That is to say, it really does belong to the purport, since conduct may depend upon its being appealed to. Yet in ordinary cases, it will not be needful that this should be done. Such seem to me to be the facts, phrase them how you may.

DOCTOR W. I am glad to hear you say so. And what do you think of Humanism?

PRAGMATICIST. Why if you had said *Anthropomorphism*, I should have replied that I heartily embrace most of the clauses of that doctrine, if some right of private interpretation be allowed me. I hold, for instance, that man is so completely hemmed in by the bounds of his possible practical experience, his mind is so restricted to being the instrument of his needs, that he cannot, in the least, *mean* anything that transcends those limits. The strict consequence of this is, that it is all nonsense to tell him that he must not think in this or that way because to do so would be to transcend the limits of a possible experience. For let him try ever so hard to think anything about what is beyond that limit, it simply cannot be done. You might as well pass a law that no man shall jump over the moon; it wouldn't forbid him to jump just as high as he possibly could.

For much the same reason, I do not believe that man can have the idea of any cause or agency so stupendous that there is any more adequate way of conceiving it than as vaguely like a man. Therefore, whoever cannot look at the starry heavens without thinking that all this universe must have had an adequate cause, can in my opinion no otherwise think of that cause half so justly than by thinking it is God.

But when you talk of Humanism, I am utterly perplexed to know what it means. One of its clauses seems borrowed from Hegel, on whom how greatly its author dotes is well known. Namely, he apparently does not wish to have phenomena torn to pieces; or at any rate not if that introduces any falsity; and he does not wish us to devote any attention to the effects of conditions that do not occur, or at any rate not to substitute the solution of such a problem for the true problems of nature. For my part, I think such talk shows great ignorance of the conditions of science. Then again, as I understand it, this Humanism is to be a philosophy not purely intellectual because every

department of man's nature must be voiced in it. For my part, I beg to be excused from having any dealings with such a philosophy. I wish philosophy to be a strict science, passionless and severely fair. I know very well that science is not the whole of life, but I believe in the division of labor among intellectual agencies. The apostle of Humanism says that professional philosophists "have rendered philosophy like unto themselves, abstruse, arid, abstract, and abhorrent." But I conceive that some branches of science are not in a healthy state if they are *not* abstruse, arid, and abstract, in which case, like the Aristotelianism which is this gentleman's particular *bête noire*, it will be as Shakespeare said (*of it*, remember):

> Not harsh and crabbed as dull fools suppose,
> But musical as is Apollo's lute, etc.

ISSUES OF PRAGMATICISM

Charles S. Peirce. "Issues of Pragmaticism." *The Monist* 15.4 (October 1905): 481–499.

Pragmaticism was originally enounced[1] in the form of a maxim, as follows: Consider what effects that might *conceivably* have practical bearings you *conceive* the object of your *conception* to have. Then, your *conception* of those effects is the whole of your *conception* of the object.

I will restate this in other words, since ofttimes one can thus eliminate some unsuspected source of perplexity to the reader. This time it shall be in the indicative mood, as follows: The entire intellectual purport of any symbol consists in the total of all general modes of rational conduct which, conditionally upon all the possible different circumstances and desires, would ensue upon the acceptance of the symbol.

Two doctrines that were defended by the writer about nine years before the formulation of pragmaticism may be treated as consequences of the latter belief. One of these may be called Critical Common-sensism. It is a variety of the Philosophy of Common Sense, but is marked by six distinctive characters, which had better be enumerated at once.

Character I. Critical Common-sensism admits that there not only are indubitable propositions but also that there are indubitable inferences. In one sense, anything evident is indubitable; but the propositions and inferences which Critical Common-sensism holds to be original, in the sense one cannot "go behind" them (as the lawyers say), are indubitable in the sense of being acritical. The term "reasoning" ought to be confined to such fixation of one belief by another as is reasonable, deliberate, self-controlled. A reasoning must be conscious; and this consciousness is not mere "immediate consciousness," which (as I argued in 1868, *J. Spec. Phil.*, Vol. II) is simple Feeling viewed from another side, but is in its ultimate nature (meaning in that characteristic element of it that is not reducible to anything simpler), a sense of taking a habit, or disposition to respond to a given kind of stimulus in a given kind of way. As to the nature of that, some *éclaircissements* will appear below and again in my third paper, on the Basis of Pragmaticism. But the secret of

[1] *Popular Science Monthly*, XII, 293; for Jan. 1878. An introductory article opens the volume, in the number for Nov., 1877.

rational consciousness is not so much to be sought in the study of this one peculiar nucleolus, as in the review of the process of self-control in its entirety. The machinery of logical self-control works on the same plan as does moral self-control, in multiform detail. The greatest difference, perhaps, is that the latter serves to inhibit mad puttings forth of energy, while the former most characteristically insures us against the quandary of Buridan's ass. The formation of habits under imaginary action (see the paper of Jan., 1878, p. 290 at the top) is one of the most essential ingredients of both; but in the logical process the imagination takes far wider flights, proportioned to the generality of the field of inquiry, being bounded in pure mathematics solely by the limits of its own powers, while in the moral process we consider only situations that may be apprehended or anticipated. For in moral life we are chiefly solicitous about our conduct and its inner springs, and the approval of conscience, while in intellectual life there is a tendency to value existence as the vehicle of forms. Certain obvious features of the phenomena of self-control (and especially of habit), can be expressed compactly and without any hypothetical addition, except what we distinctly rate as imagery, by saying that we have an occult nature of which and of its contents we can only judge by the conduct that it determines, and by phenomena of that conduct. All will assent to that (or all but the extreme nominalist), but anti-synechistic thinkers wind themselves up in a factitious snarl by falsifying the phenomena in representing consciousness to be, as it were, a skin, a separate tissue, overlying an unconscious region of the occult nature, mind, soul, or physiological basis. It appears to me that in the present state of our knowledge a sound methodeutic prescribes that, in adhesion to the appearances, the difference is only relative and the demarcation not precise.

According to the maxim of Pragmaticism, to say that determination affects our occult nature is to say that it is capable of affecting deliberate conduct; and since we are conscious of what we do deliberately, we are conscious *habitualiter* of whatever hides in the depths of our nature; and it is presumable (and *only* presumable,[2] although curious instances are on record) that a sufficiently energetic effort of attention would bring it out. Consequently, to say that an operation of the mind is controlled is to say that it is, in a special sense, a conscious operation; and this no doubt is the consciousness of reasoning. For this theory requires that in reasoning we should be conscious, not only of the conclusion, and of our deliberate approval of it, but also of its being the result of the premiss from which it does result, and furthermore that the inference is one of a possible class of inferences which conform to one guiding principle. Now in fact we find a well-marked class of mental operations, clearly of a

[2] But see the experiments of J. Jastrow and me: "On Small Differences of Sensation" in the *Memoirs of the National Academy of Sciences*. Vol. III.

different nature from any others which do possess just these properties. They alone deserve to be called *reasonings*; and if the reasoner is conscious, even vaguely, of what his guiding principle is, his reasoning should be called a *logical argumentation.* There are, however, cases in which we are conscious that a belief has been determined by another given belief, but are not conscious that it proceeds on any general principle. Such is St. Augustine's "*cogito, ergo sum.*" Such a process should be called, not a reasoning but an *acritical inference.* Again, there are cases in which one belief is determined by another, without our being at all aware of it. These should be called *associational suggestions of belief.*

Now the theory of Pragmaticism was originally based, as anybody will see who examines the papers of Nov. 1877 and Jan. 1878, upon a study of that experience of the phenomena of self-control which is common to all grown men and women; and it seems evident that to some extent, at least, it must always be so based. For it is to conceptions of deliberate conduct that Pragmaticism would trace the intellectual purport of symbols; and deliberate conduct is self-controlled conduct. Now control may itself be controlled, criticism itself subjected to criticism; and ideally there is no obvious definite limit to the sequence. But if one seriously inquires whether it is possible that a completed series of actual efforts should have been endless or beginningless (I will spare the reader the discussion), I think he can only conclude that (with some vagueness as to what constitutes an effort) this must be regarded as impossible. It will be found to follow that there are, besides perceptual judgments, original (i.e., indubitable because uncriticized) beliefs of a general and recurrent kind, as well as indubitable acritical inferences.

It is important for the reader to satisfy himself that genuine doubt always has an external origin, usually from surprise; and that it is as impossible for a man to create in himself a genuine doubt by such an act of the will as would suffice to imagine the condition of a mathematical theorem, as it would be for him to give himself a genuine surprise by a simple act of the will.

I beg my reader also to believe that it would be impossible for me to put into these articles over two percent of the pertinent thought which would be necessary in order to present the subject as I have worked it out. I can only make a small selection of what it seems most desirable to submit to his judgment. Not only must all steps be omitted which he can be expected to supply for himself, but unfortunately much more that may cause him difficulty.

Character II. I do not remember that any of the old Scotch philosophers ever undertook to draw up a complete list of the original beliefs, but they certainly thought it a feasible thing, and that the list would hold good for the minds of all men from Adam down. For in those days Adam was an undoubted historical personage. Before any waft of the air of evolution had reached those coasts how could they think otherwise? When I first wrote, we were hardly orientated in the new ideas, and my impression was that the indubitable propositions changed with a thinking man from year to year. I made some studies

preparatory to an investigation of the rapidity of these changes, but the matter was neglected, and it has been only during the last two years that I have completed a provisional inquiry which shows me that the changes are so slight from generation to generation, though not imperceptible even in that short period, that I thought to own my adhesion, under inevitable modification, to the opinion of that subtle but well-balanced intellect, Thomas Reid, in the matter of Common Sense (as well as in regard to immediate perception, along with Kant).[3]

Character III. The Scotch philosophers recognized that the original beliefs, and the same thing is at least equally true of the acritical inferences, were of the general nature of instincts. But little as we know about instincts, even now, we are much better acquainted with them than were the men of the XVIIIth century. We know, for example, that they can be somewhat modified in a very short time. The great facts have always been known; such as that instinct seldom errs, while reason goes wrong nearly half the time, if not more frequently. But one thing the Scotch failed to recognize is that the original beliefs only remain indubitable in their application to affairs that resemble those of a primitive mode of life. It is, for example, quite open to reasonable doubt whether the motions of electrons are confined to three dimensions, although it is good methodeutic to presume that they are until some evidence to the contrary is forthcoming. On the other hand, as soon as we find that a belief shows symptoms of being instinctive, although it may seem to be dubitable, we must suspect that experiment would show that it is not really so; for in our artificial life, especially in that of a student, no mistake is more likely than that of taking a paper-doubt for the genuine metal. Take, for example, the belief in the criminality of incest. Biology will doubtless testify that the practice is unadvisable; but surely nothing that it has to say could warrant the intensity of our sentiment about it. When, however, we consider the thrill of horror which the idea excites in us, we find reason in that to consider it to be an instinct; and from that we may infer that if some rationalistic brother and sister were to marry, they would find that the conviction of horrible guilt could not be shaken off.

In contrast to this may be placed the belief that suicide is to be classed as murder. There are two pretty sure signs that this is not an instinctive belief. One is that it is substantially confined to the Christian world. The other is that when it comes to the point of actual self-debate, this belief seems to be completely expunged and ex-sponged from the mind. In reply to these powerful arguments, the main points urged are the authority of the Fathers of the Church and the

[3] I wish I might hope, after finishing some more difficult work, to be able to resume this study and go to the bottom of the subject, which needs the qualities of age and does not call upon the powers of youth. A great range of reading is necessary; for it is the belief men *betray* and not that which they *parade* which has to be studied.

undoubtedly intense instinctive clinging to life. The latter phenomenon is, however, entirely irrelevant. For though it is a wrench to part with life, which has its charms at the very worst, just as it is to part with a tooth, yet there is no *moral* element in it whatever. As to the Christian tradition, it may be explained by the circumstances of the early Church. For Christianity, the most terribly earnest and most intolerant of religions (see *The Book of Revelations of St. John the Divine*), – and it remained so until diluted with civilization, – recognized no morality as worthy of an instant's consideration except Christian morality. Now the early Church had need of martyrs, i.e., witnesses, and if any man had done with life, it was abominable infidelity to leave it otherwise than as a witness to its power. This belief, then, should be set down as dubitable; and it will no sooner have been pronounced dubitable, than Reason will stamp it as false.

The Scotch School appears to have no such distinction, concerning the limitations of indubitability and the consequent limitations of the jurisdiction of original belief.

Character IV. By all odds, the most distinctive character of the Critical Common-sensist, in contrast to the old Scotch philosopher, lies in his insistence that the acritically indubitable is invariably vague.

Logicians have been at fault in giving Vagueness the go-by, so far as not even to analyze it. The present writer has done his best to work out the Stechiology (or Stoicheiology), Critic, and Methodeutic of the subject, but can here only give a definition or two with some proposals respecting terminology.

Accurate writers have apparently made a distinction between the *definite* and the *determinate*. A subject is *determinate* in respect to any character which inheres in it or is (universally and affirmatively) predicated of it, as well as in respect to the negative of such character, these being the very same respect. In all other respects it is *indeterminate*. The *definite* shall be defined presently. A sign (under which designation I place every kind of thought, and not alone external signs) that is in any respect objectively indeterminate (i.e., whose object is undetermined by the sign itself) is objectively *general* in so far as it extends to the interpreter the privilege of carrying its determination further.[4]

[4] Hamilton and a few other logicians understood the subject of a universal proposition in the collective sense; but every person who is well-read in logic is familiar with many passages in which the leading logicians explain with an iteration that would be superfluous if all readers were intelligent that such subject is distributively not collectively general. A term denoting a collection is singular and such a term is an "abstraction" or product of the operation of hypostatic abstraction as truly as is the name of the essence. "Mankind" is quite as much an abstraction and *ens rationis* as is "humanity." Indeed, every object of a conception is either a signate individual or some kind of indeterminate individual. Nouns in the plural are usually distributive and general; common nouns in the singular are usually indefinite.

Example: "Man is mortal." To the question, What man? the reply is that the proposition explicitly leaves it to you to apply its assertion to what man or men you will. A sign that is objectively indeterminate in any respect is objectively *vague* in so far as it reserves further determination to be made in some other conceivable sign, or at least does not appoint the interpreter as its deputy in this office. *Example:* "A man whom I could mention seems to be a little conceited." The *suggestion* here is that the man in view is the person addressed; but the utterer does not authorize such an interpretation or *any* other application of what she says. She can still say, if she likes, that she does *not* mean the person addressed. Every utterance naturally leaves the right of further exposition in the utterer; and therefore, in so far as a sign is indeterminate, it is vague, unless it is expressly or by a well-understood convention rendered general. Usually, an affirmative predication covers *generally* every essential character of the predicate, while a negative predication *vaguely* denies some essential character. In another sense, honest people, when not joking, intend to make the meaning of their words determinate, so that there shall be no latitude of interpretation at all. That is to say, the character of their meaning consists in the implications and non-implications of their words; and they intend to fix what is implied and what is not implied. They believe that they succeed in doing so, and if their chat is about the theory of numbers, perhaps they may. But the further their topics are from such presciss, or "abstract," subjects, the less possibility is there of such precision of speech. In so far as the implication is not determinate, it is usually left vague; but there are cases where an unwillingness to dwell on disagreeable subjects causes the utterer to leave the determination of the implication to the interpreter; as if one says, "That creature is filthy, in every sense of the term."

Perhaps a more scientific pair of definitions would be that anything is *general* in so far as the principle of excluded middle does not apply to it and is *vague* in so far as the principle of contradiction does not apply to it. Thus, although it is true that "Any proposition you please, *once you have determined its identity*, is either true or false"; yet *so long as it remains indeterminate and so without identity*, it need neither be true that any proposition you please is true, nor that any proposition you please is false. So likewise, while it is false that "A proposition *whose identity I have determined* is both true and false," yet until it is determinate, it may be true that a proposition is true and that a proposition is false.

In those respects in which a sign is not vague, it is said to be *definite*, and also with a slightly different mode of application, to be *precise*, a meaning probably due to *præcisus* having been applied to *curt* denials and refusals. It has been the well-established, ordinary sense of *precise* since the Plantagenets; and it were much to be desired that this word, with its derivates *precision*, *precisive*, etc., should, in the dialect of philosophy, be restricted to this sense. To express the act of *rendering precise* (though usually only in reference to

numbers, dates, and the like), the French have the verb *préciser*, which, after the analogy of *décider*, should have been *précider*. Would it not be a useful addition to our English terminology of logic, to adopt the verb *to precide*, to express the general sense, to render precise? Our older logicians with salutary boldness seem to have created for their service the verb *to prescind*, the corresponding Latin word meaning only to "cut off at the end," while the English word means to suppose without supposing some more or less determinately indicated accompaniment. In geometry, for example, we "prescind" shape from color, which is precisely the same thing as to "abstract" color from shape, although very many writers employ the verb "to abstract" so as to make it the equivalent of "prescind." But whether it was the invention or the courage of our philosophical ancestors which exhausted itself in the manufacture of the verb "prescind," the curious fact is that instead of forming from it the noun *prescission*, they took pattern from the French logicians in putting the word *precision* to this second use. About the same time[5] [See Watts's *Logick*, 1725, I, vi, 9 *ad fin.*], the adjective *precisive* was introduced to signify what *prescissive* would have more unmistakably conveyed. If we desire to rescue the good ship Philosophy for the service of Science from the hands of lawless rovers of the sea of literature, we shall do well to keep prescind, presciss, prescission, and prescissive on the one hand, to refer to dissection in hypothesis, while precide, precise, precision, and precisive are used so as to refer exclusively to an expression of determination which is either full or made free for the interpreter. We shall thus do much to relieve the stem "abstract" from staggering under the double burden of conveying the idea of prescission as well as the unrelated and very important idea of the creation of an *ens rationis* out of an *ἔπος τερόεν*, – to filch the phrase to furnish a name for an expression of non-substantive thought, – an operation that has been treated as a subject of ridicule, – this hypostatic abstraction, – but which gives mathematics half its power.

The purely formal conception that the three affections of terms, *determination*, *generality*, and *vagueness* form a group dividing a category of what Kant calls "functions of judgment" will be passed by as unimportant by those who have yet to learn how important a part purely formal conceptions may play in philosophy. Without stopping to discuss this, it may be pointed out that the "quantity" of propositions in logic, that is, the distribution of the *first* subject,[6] is either *singular* (that is, determinate, which renders it substantially

[5] But unfortunately it has not been in the writer's power to consult the *Oxford Dictionary* concerning these words; so that probably some of the statements in the text might be corrected with the aid of that work.

[6] Thus returning to the writer's original nomenclature, in spite of *Monist* VII, 209, where an obviously defective argument was regarded as sufficient to determine a mere matter of terminology. But the Quality of propositions is there regarded from a point of view

negligible in formal logic), or *universal* (that is, general), or *particular* (as the mediaeval logicians say, that is, vague or *indefinite*). It is a curious fact that in the logic of relations it is the first and last quantifiers of a proposition that are of chief importance. To affirm of anything that it is a horse is to yield to it *every* essential character of a horse: to deny of anything that it is a horse is vaguely to refuse to it *some* one or more of those essential characters of the horse. There are, however, predicates that are unanalyzable in a given state of intelligence and experience. These are, therefore, determinately affirmed or denied. Thus, this same group of concepts reappears. Affirmation and denial are in themselves unaffected by these concepts, but it is to be remarked that there are cases in which we can have an apparently definite idea of a border line between affirmation and negation. Thus, a point of a surface may be in a region of that surface, or out of it, or on its boundary. This gives us an indirect and vague conception of an intermediacy between affirmation and denial in general, and consequently of an intermediate, or nascent state, between determination and indetermination. There must be a similar intermediacy between generality and vagueness. Indeed, in an article in the seventh volume of *The Monist*, pp. 205–217, there lies just beneath the surface of what is explicitly said, the idea of an endless series of such *intermediacies*. We shall find below some application for these reflections.

Character V. The Critical Common-sensist will be further distinguished from the old Scotch philosopher by the great value he attaches to doubt, provided only that it be the weighty and noble metal itself, and no counterfeit nor paper substitute. He is not content to ask himself whether he does doubt, but he invents a plan for attaining to doubt, elaborates it in detail, and then puts it into practice, although this may involve a solid month of hard work; and it is only after having gone through such an examination that he will pronounce a belief to be indubitable. Moreover, he fully acknowledges that even then it may be that some of his indubitable beliefs may be proved false.

The Critical Common-sensist holds that there is less danger to heuretic science in believing too little than in believing too much. Yet for all that, the consequences to heuretics of believing too little may be no less than disaster.

Character VI. Critical Common-sensism may fairly lay claim to this title for two sorts of reasons; namely, that on the one hand it subjects four opinions to rigid criticism: its own; that of the Scotch school; that of those who would base logic or metaphysics on psychology or any other special science, the least tenable of all the philosophical opinions that have any vogue; and that of Kant; while on the other hand it has besides some claim to be called Critical from the fact that it is but a modification of Kantism. The present writer was

which seems extrinsic. I have not had time, however, to re-explore all the ramifications of this difficult question by the aid of existential graphs, and the statement in the text about the last quantifier may need modification.

a pure Kantist until he was forced by successive steps into Pragmaticism. The Kantist has only to abjure from the bottom of his heart the proposition that a thing-in-itself can, however indirectly, be conceived; and then correct the details of Kant's doctrine, and he will find himself to have become a Critical Common-sensist.

Another doctrine which is involved in Pragmaticism as an essential consequence of it, but which the writer defended (*J. Spec. Phil.*, Vol. II, p. 155 *ad fin.* 1868, and *N. Am. Rev.*, Vol. CXIII, pp. 449–472, 1871) before he had formulated, even in his own mind, the principle of pragmaticism, is the scholastic doctrine of realism. This is usually defined as the opinion that there are real objects that are general, among the number being the modes of determination of existent singulars, if, indeed, these be not the only such objects. But the belief in this can hardly escape being accompanied by the acknowledgment that there are, besides, real *vagues*, and especially, real *possibilities*. For possibility being the denial of a necessity, which is a kind of generality, is vague like any other contradiction of a general. Indeed, it is the reality of some possibilities that pragmaticism is most concerned to insist upon. The article of Jan. 1878 endeavored to gloze over this point as unsuited to the exoteric public addressed; or perhaps the writer wavered in his own mind. He said that if a diamond were to be formed in a bed of cotton-wool, and were to be consumed there without ever having been pressed upon by any hard edge or point, it would be merely a question of nomenclature whether that diamond should be said to have been hard or not. No doubt, this is true, except for the abominable falsehood in the word MERELY, implying that symbols are unreal. Nomenclature involves classification; and classification is true or false, and the generals to which it refers are either reals in the one case, or figments in the other. For if the reader will turn to the original maxim of pragmaticism at the beginning of this article, he will see that the question is, not what *did* happen, but whether it would have been well to engage in any line of conduct whose successful issue depended upon whether that diamond *would* resist an attempt to scratch it, or whether all other logical means of determining how it ought to be classed *would* lead to the conclusion which, to quote the very words of that article, would be "the belief which alone could be the result of investigation carried *sufficiently far*." Pragmaticism makes the ultimate intellectual purport of what you please to consist in conceived conditional resolutions, or their substance; and therefore, the conditional propositions, with their hypothetical antecedents, in which such resolutions consist, being of the ultimate nature of meaning, must be capable of being true, that is, of expressing whatever there be which is such as the proposition expresses, independently of being thought to be so in any judgment, or being represented to be so in any other symbol of any man or men. But that amounts to saying that possibility is sometimes of a real kind.

Fully to understand this, it will be needful to analyze modality, and ascertain in what it consists. In the simplest case, the most subjective meaning, if a person does not know that a proposition is false, he calls it *possible*. If, however, he knows that it is *true*, it is much more than possible. Restricting the word to its characteristic applicability, a state of things has the Modality of the possible, – that is, of the merely possible, – only in case the contradictory state of things is likewise possible, which proves possibility to be the vague modality. One who knows that Harvard University has an office in State Street, Boston, and has impression that it is at No. 30, but yet suspects that 50 is the number, would say "I think it is at No. 30, but it *may be* at No. 50," for "it *is possibly* at No. 50." Thereupon, another, who does not doubt his recollection, might chime in, "It *actually is* at No. 50," or simply "it *is* at No. 50," or "it *is* at No. 50, *de inesse*." Thereupon, the person who had first asked what the number was might say, "Since you are so positive, it *must be* at No. 50," or "I know the first figure is 5. So, since we are both certain the second is a 0, why 50 it *necessarily is*." That is to say, in this most subjective kind of Modality, that which is known by direct recollection is in the Mode of *Actuality*, the determinate mode. But when knowledge is indeterminate among alternatives, either there is one state of things which alone accords with them all, when this is in the Mode of *Necessity*, or there is more than one state of things that no knowledge excludes, when each of these is in the Mode of *Possibility*.

Other kinds of subjective Modality refer to a Sign or Representamen which is assumed to be true, but which does not include the Utterer's (i.e. the speaker's, writer's, thinker's, or other symbolizer's) total knowledge, the different Modes being distinguished very much as above. There are other cases, however, in which, justifiably or not, we certainly think of Modality as objective. A man says, "I *can* go to the seashore if I like." Here is implied, to be sure, his ignorance of how he will decide to act. But this is not the point of the assertion. It is that the complete determination of conduct in the *act* not yet having taken place, the further determination of it belongs to the subject of the action regardless of external circumstances. If he had said, "I *must* go where my employers may send me," it would imply that the function of such further determination lay elsewhere. In "You *may* do so and so," and "You *must* do so," the "may" has the same force as "can" except that in the one case freedom from particular circumstances is in question, and in the other freedom from a law or edict. Hence the phrase, "You *may* if you *can*." I must say that it is difficult for me to preserve my respect for the competence of a philosopher whose dull logic, not penetrating beneath the surface, leaves him to regard such phrases as misrepresentations of the truth. So an act of hypostatic abstraction which in itself is no violation of logic, however it may lend itself to a dress of superstition, may regard the collective tendencies to variableness in the world, under the name of Chance, as at one time having

their way, and at another time overcome by the element of order; so that, for example, a superstitious cashier, impressed by a bad dream, may say to himself on a Monday morning, "*Maybe*, the bank has been robbed." No doubt, he recognizes his total ignorance in the matter. But besides that, he has in mind the absence of any particular cause which should protect his bank more than others that are robbed from time to time. He thinks of the variety in the universe as vaguely analogous to the indecision of a person, and borrows from that analogy the garb of his thought. At the other extreme stand those who declare as inspired (for they have no rational proof of what they allege) that an actuary's advice to an insurance company is based on nothing at all but ignorance.

Here is another example of objective possibility: "A pair of intersecting rays, i.e., unlimited straight lines conceived as movable objects, *can* (or *may*) move, without ceasing to intersect, so that one and the same hyperboloid shall be completely covered by the track of each of them." How shall we interpret this, remembering that the object spoken of, the pair of rays, is a pure creation of the Utterer's imagination, although it is required (and indeed, forced) to conform to the laws of space? Some minds will be better satisfied with a more subjective, or nominalistic, others with a more objective, realistic interpretation. But it must be confessed on all hands that whatever degree or kind of reality belongs to pure space belongs to the substance of that proposition, which merely expresses a property of space.

Let us now take up the case of that diamond which, having been crystallized upon a cushion of jewelers' cotton, was accidentally consumed by fire before the crystal of corundum that had been sent for had had time to arrive, and indeed without being subjected to any other pressure than that of the atmosphere and its own weight. The question is, Was that diamond *really* hard? It is certain that no discernible *actual* fact determined it to be so. But is its hardness not, nevertheless, a *real* fact? To say, as the article of Jan. 1878 seems to intend, that it is just as an arbitrary "usage of speech" chooses to arrange its thoughts, is as much as to decide against the reality of the property, since the real is that which is such as it is regardless of how it is, at any time, thought to be. Remember that this diamond's condition is not an isolated fact. There is no such thing; and an isolated fact could hardly be real. It is an unsevered, though presciss part of the unitary fact of nature. Being a diamond, it was a mass of pure carbon, in the form of a more or less transparent crystal (brittle, and of facile octahedral cleavage, unless it was of an unheard of variety), which, if not trimmed after one of the fashions in which diamonds may be trimmed, took the shape of an octahedron, apparently regular (I need not go into minutiae), with grooved edges, and probably with some curved faces. Without being subjected to any considerable pressure, it could be found to be insoluble, very highly refractive, showing under radium rays (and perhaps under "dark light" and X-rays) a peculiar bluish phosphorescence,

having as high a specific gravity as realgar or orpiment, and giving off during its combustion less heat than any other form of carbon would have done. From some of these properties hardness is believed to be inseparable. For like it they bespeak the high polymerization of the molecule. But however this may be, how can the hardness of all other diamonds fail to bespeak *some* real relation among the diamonds without which a piece of carbon would not be a diamond? Is it not a monstrous perversion of the word and concept *real* to say that the accident of the non-arrival of the corundum prevented the hardness of the diamond from having the *reality* which it otherwise, with little doubt, would have had?

At the same time, we must dismiss the idea that the occult state of things (be it a relation among atoms or something else) which constitutes the reality of a diamond's hardness can possibly consist in anything but in the truth of a general conditional proposition. For to what else does the entire teaching of chemistry relate except to the "behavior" of different possible kinds of material substance? And what does that behavior consist in, except that if a substance of a certain kind should be exposed to an agency of a certain kind, a certain kind of sensible result *would* ensue, according to our experiences hitherto. As for the pragmaticist, it is precisely his position that nothing else than this can be so much as *meant* by saying that an object possesses a character. He is therefore obliged to subscribe to the doctrine of a real Modality, including real Necessity and real Possibility.

A good question, for the purpose of illustrating the nature of Pragmaticism, is, What is Time? It is not proposed to attack those most difficult problems connected with the psychology, the epistemology, or the metaphysics of Time, although it will be taken for granted, as it must be according to what has been said, that Time is real. The reader is only invited to the humbler question of what we mean by Time, and not of every kind of meaning attached to Past, Present, and Future either. Certain peculiar feelings are associated with the three general determinations of Time; but those are to be sedulously put out of view. That the reference of events to Time is irresistible will be recognized; but as to how it may differ from other kinds of irresistibility is a question not here to be considered. The question to be considered is simply, What is the intellectual purport of the Past, Present, and Future? It can only be treated with the utmost brevity.

That Time is a particular variety of Objective Modality is too obvious for argumentation. The Past consists of the sum of *faits accomplis*, and this Accomplishment is the Existential Mode of Time. For the Past really acts upon us, and *that* it does, not at all in the way in which a Law or Principle influences us, but precisely as an Existent object acts. For instance, when a *Nova Stella* bursts out in the heavens, it acts upon one's eyes just as a light struck in the dark by one's own hands would; and yet it is an event which happened before the Pyramids were built. A neophyte may remark that its reaching the

eyes, which is all we know, happens but a fraction of a second before we know it. But a moment's consideration will show him that he is losing sight of the question, which is not whether the distant Past can act upon us *immediately*, but whether it acts upon us just as any Existent does. The instance adduced (certainly a commonplace enough fact) proves conclusively that the mode of the Past is that of Actuality. Nothing of the sort is true of the Future, to compass the understanding of which it is indispensable that the reader should divest himself of his Necessitarianism, – at best, but a scientific theory, – and return to the Common-sense State of Nature. Do you never say to yourself, "I *can* do this or that as well to-morrow as to-day"? Your Necessitarianism is a theoretical pseudo-belief, – a make-believe belief, – that such a sentence does not express the real truth. That is only to stick to proclaiming the unreality of that Time, of which you are invited, be it reality or figment, to consider the meaning. You need not fear to compromise your darling theory by looking out at its windows. Be it true in theory or not, the unsophisticated conception is that everything in the Future is either *destined*, i.e., necessitated already, or is *undecided*, the contingent future of Aristotle. In other words, it is not Actual, since it does not act except through the idea of it, that is, as a law acts; but is either Necessary or Possible, which are of the same mode since (as remarked above) Negation being outside the category of Modality cannot produce a variation in Modality. As for the Present instant, it is so inscrutable that I wonder whether no sceptic has ever attacked its reality. I can fancy one of them dipping his pen in his blackest ink to commence the assault, and then suddenly reflecting that his entire life is in the Present, – the "living present," as we say, – this instant when all hopes and fears concerning it come to their end, this Living Death in which we are born anew. It is plainly that Nascent State between the Determinate and the Indeterminate that was noticed above.

Pragmaticism consists in holding that the purport of any concept is its conceived bearing upon our conduct. How, then, does the Past bear upon conduct? The answer is self-evident: whenever we set out to do anything, we "go upon," we base our conduct on facts already known, and for these we can only draw upon our memory. It is true that we may institute a new investigation for the purpose; but its discoveries will only become applicable to conduct after they have been made and reduced to a memorial maxim. In short, the Past is the sole storehouse of all our knowledge.

When we say that we know that some state of things exists, we mean that it used to exist, whether just long enough for the news to reach the brain and be retransmitted to tongue or pen, or longer ago. Thus, from whatever point of view we contemplate the Past, it appears as the Existential Mode of Time.

How does the Future bear upon conduct? The answer is that future facts are the only facts that we can, in a measure, control; and whatever there may be in the Future that is not amenable to control are the things that we *shall* be able

to infer, or *should* be able to infer under favorable circumstances. There may be questions concerning which the pendulum of opinion never would cease to oscillate, however favorable circumstances may be. But if so, those questions are *ipso facto* not *real* questions, that is to say, are questions to which there is no true answer to be given. It is natural to use the future tense (and the conditional mood is but a mollified future) in drawing a conclusion or in stating a consequence. "If two unlimited straight lines in one plane are crossed by a third making the sum … then these straight lines *will* meet on the side, etc." It cannot be denied that acritical inferences may refer to the Past in its capacity as past; but according to Pragmaticism, the conclusion of a Reasoning proper must refer to the Future. For its meaning refers to conduct, and since it is a reasoned conclusion must refer to deliberate conduct, which is controllable conduct. But the only controllable conduct is Future conduct. As for that part of the Past that lies beyond memory, the Pragmaticist doctrine is that the meaning of its being believed to be in connection with the Past consists in the acceptance as truth of the conception that we ought to conduct ourselves according to it (like the meaning of any other belief). Thus, a belief that Christopher Columbus discovered America really refers to the Future. It is more difficult, it must be confessed, to account for beliefs that rest upon the double evidence of feeble but direct memory and upon rational inference. The difficulty does not seem insuperable; but it must be passed by.

What is the bearing of the Present instant upon conduct?

Introspection is wholly a matter of inference. One is immediately conscious of his Feelings, no doubt; but not that they are feelings of an *ego*. The *self* is only inferred. There is no time in the Present for any inference at all, least of all for inference concerning that very instant. Consequently the present object must be an external object, if there be any objective reference in it. The attitude of the Present is either conative or perceptive. Supposing it to be perceptive, the perception must be immediately known as external, – not indeed in the sense in which a hallucination is *not* external, but in the sense of being present regardless of the perceiver's will or wish. Now this kind of externality is conative externality. Consequently, the attitude of the present instant (according to the testimony of Common Sense, which is plainly adopted throughout) can only be a Conative attitude. The consciousness of the Present is then that of a struggle over what shall be; and thus we emerge from the study with a confirmed belief that it is the Nascent State of the Actual.

But how is Temporal Modality distinguished from other Objective Modality? Not by any general character since Time is unique and *sui generis*. In other words there is only one Time. Sufficient attention has hardly been called to the surpassing truth of this for Time as compared with its truth for Space. Time, therefore, can only be identified by brute compulsion. But we must not go further.

THE BASIS OF PRAGMATICISM

Charles S. Peirce. "The Basis of Pragmaticism." MS 283, January 1906.

This is one of many attempts by Peirce to write an essay entitled "The Basis of Pragmaticism." This version was composed in January 1906. The text is based on the manuscript listed as MS 283 in Richard S. Robin's *Annotated Catalogue of the Papers of Charles S. Peirce* and preserved in the Houghton Library, Harvard University. The text below begins with the second section; the first section is omitted because the essential two-thirds of it are no longer extant.

Portion I. Introductory.

§2. The word "science" has three principal acceptions, to wit:

Firstly, men educated in Jesuit and similar colleges often use the term in the sense of the Greek *ἐπιστήμη*, the Latin *scientia*; that is to say, to denote knowledge for certain. (Fuller explanations are given in the *Index Aristotelicus* of Bonitz.)

Secondly, since the beginning of the XIXth century, when Coleridge so defined it in the opening dissertation to the *Encyclopaedia Metropolitana*, non-scientific people have generally understood "science" to mean systematized knowledge.

Thirdly, in the mouths of scientific men themselves "science" means the concrete body of their own proper activities, in seeking such truth as seems to them highly worthy of life-long devotion, and in pursuing it by the most critically chosen methods, including all the help both general and special that they can obtain from one another's information and reflexion.

The present writer will call science in this third sense *heuretic science*; he will call science which differs from this in all the important respects which result from investigation being pursued, not because of the august nature of the truth sought, but for the sake of some anticipated utility of it to some man or men, *practical science*, and he will call science in the Coleridgian sense *retrospective science*.

It is to be remarked that although heuretic scientists look upon their work as purely theoretical, and many of them feel a utilitarian application, even of the highest kind, is comparatively lacking in the sacredness of pure science, they are nevertheless particularly given to thinking of their results as affording

possible conditions for new experiments, if not in the narrower, then in the broader sense of the term,[1] although they may have the vaguest possible notions of what those experiments may be. This shows that regarding a truth as purely theoretical does not prevent its being regarded as a possible determinant of conduct.

§3. Two meanings of the term "philosophy" call for our particular notice. The two meanings agree in making philosophical knowledge positive, that is, in making it a knowledge of things real, in opposition to mathematical knowledge, which is a knowledge of the consequences of arbitrary hypotheses; and they further agree in making philosophical truth extremely general. But in other respects they differ as widely as they well could. For one of them, which is better entitled (except by usage) to being distinguished as *philosophia prima* than is ontology, embraces all that positive science which rests upon familiar experience and does not search out occult or rare phenomena; while the other, which has been called *philosophia ultima*, embraces all that truth which is derivable by collating the results of the different special sciences, but which is too broad to be perfectly established by any one of them. The former is well named by Jeremy Bentham's term *cenoscopy* (κοινοσκοπιά, the lookout upon the common), the latter goes by the name of *synthetic philosophy*. Widely different as the two sciences are, they are frequently confounded and intertangled; and when they are distinguished the question is often asked, 'Which of these is the true philosophy?' as if an appreciation of one necessarily involved a depreciation of the other. In the writer's opinion each is an important study. Cenoscopy should be that department of heuretic science which stands next after Mathematics, and before Idioscopy, or special science; while Synthetic Philosophy, the subject upon which Francis Bacon, Auguste Comte, William Whewell, and Herbert Spencer have left us admirable works in their several ways, stands at the head of the Retrospective Sciences.

A sound methodeutic requires heuretic science to found its researches upon cenoscopy, passing with as slight a gap as possible from the familiar to the unfamiliar.

§4. The method of cenoscopic research presents a certain difficulty. In commencing it we are confronted with the fact that we already believe a great many things. These beliefs, or at least the more general of them, ought to be reconsidered with deliberation. This implies that it should be conducted according to a deliberate plan adopted only after the severest criticism. Indeed, nothing in cenoscopy should be embraced without criticism. Each

[1] An experiment in the narrow sense is where special conditions of experience are purposely created; but any observation made to test a hypothesis is an experiment in the broader sense. Such is an observation of an occultation to test the lunar tables.

criticism should wait to be planned, and each plan should wait for criticism. Clearly, if we are to get on at all, we must put up with imperfect procedure.

The only practicable method is that of the inductive sciences, the method of trying key after key until we find one that fits. Only, energy should not be wasted in even trying a key without a rational hope of its being the sound one. The reflective reader may find reason to suspect that the writer has bestowed no little thought upon this. In truth, such a world of different considerations jostle one another in his memory that it will be best to pass them all by in so brief a *résumé*. Let us rather ask what former thinkers had done toward setting our cogitations upon some smoothly running track of ratiocination.

§5. The idea of growth, – the stately tree springing from the tiny grain, – was the key that Aristotle brought to be tried upon this intricate grim lock. In such trials he came upon those wonderful conceptions, *δύναμις* and *ἐνέργεια*, *ὕλη* and *μορφή* or *εἶδος*, or, as he might still better have said, *τύπος*, the blow, the *coup*. […] This idea of Aristotle's has proved marvellously fecund; and in truth it is the only idea covering quite the whole area of cenoscopy that has shown any marked uberosity. Many and many a century is likely to sink in Time's flood, and be buried in the mud of Lethe, before the achievements of the nineteenth shall get matched. But of all those achievements, the greatest in the eye of reason, that of bringing to light the supremacy of the element of *Growth*, was, after all, nothing but a special application of Aristotle's pure vision.

Let us lose sight of no side of it; *Growth*, – the idea, – the act, – the lifegiving principle.

One special feature of growth has always received great attention; yet its lessons are far from having today been completely learned. It is that growth cannot proceed very far until those elements of it which constitute the functions of the two sexes get well separated. The female function, the function of the seed, has always been recognized as the *δύναμις*. The female is the general and essential sex; the male merely executes a hunch, the *τύπος* of the *μορφή*. It is the principle of unrest. But do not forget that the seed needs to be left to itself to grow as far as it can alone, before the *coup* of fertilization disturbs it. In order that it could so have grown alone, and indeed, in low organisms have reached the height of their attained potentiality, the female must have had an admixture of the restless. Pure femininity is not to be found even in the nucleus of the crystal of alum quietly growing out of its evaporating solution. Pure femininity can be conceived in a general way, but it cannot be realized even in consistent imagination. As for pure masculinity, it is an absurdity and nonsense, *vox et praeterea nihil*.

Besides those two requisites of perfecting growth, there is a third, not implied in either of them, nor in both together. It is the congress of those two. It is something demonstrably additional to them. When this comes a new life begins.

Now apply these ideas to knowledge. Observe that this will itself be an act of copulation. There is nothing in the feminine conception of knowledge, nor in the masculine conception of sexuality, to prove that there will be any fruit for philosophy in bringing them together. An incomprehensible instinct urges us to it; nothing else.

The seed of knowledge is the mind, the field of available consciousness, – all that is present or that can be called up. The rude *τύπος* is experience. He who may not have felt quite sure of understanding why the entrance of the element of *Form* should be [so] called will find enlightenment in thinking of the matter from this point of view.

Portion II. Sketch of Cenoscopy.

§6. The business of cenoscopy is to construct, as best one may, a true comprehension of the *omne*, – and if possible, of the *totum*, – of being and of non-being, and of the principal divisions of this *omne*.

How shall we lay out this business?

Let us not lose all possibility of advantage from the Aristotelian key merely because we cannot be quite sure, in advance of the essay, that it will fit.

Cenoscopy is not to resort to special experience, or only upon the most exceptional occasions, in order not to break the discussion of one question. There is no veritable exception. To say that cenoscopy is not to resort to special experience is to say that it is to be science in the seminal condition. Yet it could have no logic at all unless both of the sexual elements, together with the third that springs from their union, were all present.

Hence comes the suggestion that Cenoscopy should have three divisions, – a suggestion that further considerations, that cannot here be set forth, amply confirm. It will be well to state what these divisions are.

§7. Metaphysics is the proper designation for the third and completing department of cenoscopy, which in places welds itself into idioscopy, or special science. Its business is to study the most general features of reality and real objects. But in its present condition it is, even more than the other branches of cenoscopy, a puny, rickety, and scrofulous science. It is only too plain that those who pretend to cultivate it carry not the hearts of true men of science within their breast. Instead of striving with might and main to find out what errors they have fallen into, and exulting joyously at every such discovery, they are scared to look Truth in the face. They turn tail and flee her. Only a small number out of the great catalogue of problems which it is their business to solve have they ever taken up at all, and those few most feebly. Here let us set down almost at random a small specimen of the questions of metaphysics which press, not for hasty answers, but for industrious and solid investigation: Whether or no there be any real indefiniteness, or real possibility and impossibility? Whether or not there is any definite

indeterminacy? Whether there be any strictly individual existence? Whether there is any distinction, other than one of more and less, between fact and fancy? Or between the external and the internal worlds? What general explanation or account can be given of the different qualities of feeling and their apparent connection with determinations of mass, space, and time? Do all possible qualities of sensation, including of course a much vaster variety of which we have no experience than of those which we know, form one continuous system, as colors seem to do? What external reality do the qualities of sense represent, in general? Is Time a real thing, and if not, what is the nature of the reality that it represents? How about Space, in these regards? How far, and in what respects, is Time external, or does it have immediate contents that are external? Are Time and Space continuous? What numerically are the Chorisy, Cyclosy, Periphraxy, and Apeiry of Space? Has Time, or has Space, any limit or node? Is *hylozoism* an opinion, actual or conceivable, rather than a senseless vocable; and if so, what is, or would be, that opinion? What is consciousnesss or mind like; meaning, is it a single continuum like Time and Space, which is for different purposes variously broken up by that which it contains; or is it composed of solid atoms, or is it more like a fluid? Has Truth, in Kantian phrase, any "material" characteristics in general, by which it can with any degree of probability be recognized? Is there, for example, any general tendency in the course of events, any progress in one direction on the whole?

While a summary study of metaphysics will suffice to dispose of its problems, so far as they could disturb the course of ordinary scientific researches, there are sundry branches of science, and they are mostly particularly interesting branches to human curiosity, – psychology, for example, and psychical research, and on the other wing of idioscopy, molecular and corpuscular physics, radio-activity, physical geometry, and so on, – which cannot escape entirely.

§8. Normative Science forms the mid portion of cenoscopy and its most characteristic part. In any adequate exposition of the *rationale* of pragmaticism, this present Section, the eighth, would be particularly important, not so much for any especially definite ratiocination that it would have to unfold, as because it would serve to convey the reader into the intellectual clime, and for that matter to the very field where the operations of our argumentation are to be executed and our encounter with hard fact waged. He ought to be transported hither through the empyrean of pure thought as calmly as in the basket of a balloon, whence eye might sweep the general map of philosophy. It is a grievous shame and imposition that the reader should instead have to traverse this space, so full of marvels and of beauties, as in a night train, pent up in this cramped Section, obscure and airless. It is much to be feared that it will prove to be more veritably a "sleeper" than any place of torment to which Pullman ever consigned him.

The topics which have mainly to be considered in this Section suggest its division into three parts, as follows:

(A) Of Normative Science as an indispensible preliminary, propedeutic, and prolegomenon to Metaphysics.

(B) Of the hard dualism of Normative Science and whence it comes.

(C) Of the nature of Normative Science, as entirely distinct from practical science, though it tends to produce this, and as affording a basis for psychology and consequently in no degree itself resting upon psychology. In what sense it is a science of Mind, at all. Its approaches to Mathematics must also be discussed.

A. It would be folly to attack the fastnesses of the arcana of Metaphysics, with all their barbed wire entanglements, without having thoroughly considered beforehand the nature of the reasoning to be employed and the source of its validity. This is the most obvious reason for making one normative science antecede metaphysics; and it is also the most available reason and the one most suited to governing the dispositions of the elements of the research. It is not the strongest reason by a good deal. The strongest reason is that most of the metaphysical conceptions, such as Substance, Quality, Relation, Potentiality, Law, Causation, etc. are nothing but logical conceptions applied to real objects, and can only attain elucidation in logical study. But it is not convenient to prove this in advance, nor does it suggest the best arrangement until logic has actually been fathomed to its very bottom.

Logic regarded from one instructive, though partial and narrow, point of view, is the theory of deliberate thinking. To say that any thinking is deliberate is to imply that it is controlled with a view to making it conform to a purpose or ideal. Thinking is universally acknowledged to be an active operation. Consequently, the control of thinking with a view to its conformity to a standard or ideal is a special case of the control of action to make it conform to a standard; and the theory of the former must be a special determination of the theory of the latter. Now special theories should always be made to rest upon the general theories of which they are amplifications. The present writer takes the theory of the control of conduct, and of action in general, so as to conform to an ideal, as being the mid-normative science; that is, as the second of the trio, and as that one of the three sciences in which the distinctive characters of normative science are most strongly marked. He will not undertake to pronounce any other distribution of the matter of normative science to be wrong; but according to the dissection of that matter which seems to him to separate studies as they must be separated in research, such will be the mid-normative science. Since the normative sciences are usually held to be three, Esthetics, Ethics, and Logic, and since he, too, makes them three, he would term the mid-normative science ethics if this did not seem to be forbidden by the received acception of that term. He accordingly proposes

to name the mid-normative science, as such (whatever its content may be), *Antethics*, that is, that which is put in place of ethics, the usual second member of the trio. It is the writer's opinion that this *antethics* should be the theory of the conformity of action to an ideal. Its name, as such, will naturally be *practics*. Ethics is not practics; first, because ethics involves more than the theory of such conformity; namely it involves the theory of the ideal itself, the nature of the *summum bonum*; and secondly, because, in so far as *ethics* studies the conformity of conduct to an ideal, it is limited to a particular ideal, which, whatever the professions of moralists may be, is in fact nothing but a sort of composite photograph of the conscience of the members of the community. In short, it is nothing but a traditional standard, accepted, very wisely, without radical criticism, but with a silly pretence of critical examination. The science of morality, virtuous conduct, right living, can hardly claim a place among the heuretic sciences.

It has been a great, but frequent, error of writers on ethics to confound an ideal of conduct with a motive to action. The truth is that these two objects belong to different categories. Every action has a motive; but an ideal only belongs to a line of conduct which is deliberate. To say that conduct is deliberate implies that each action, or each important action, is reviewed by the actor and that his judgment is passed upon it, as to whether he wishes his future conduct to be like that or not. His ideal is the kind of conduct which attracts him upon review. His self-criticism followed by a more or less conscious resolution that in its turn excites a determination of his habit, will, with the aid of the sequelae, *modify* a future action; but it will not generally be a moving cause to action. It is an almost purely passive liking for a way of doing whatever he may be moved to do. Although it affects his own conduct, and nobody else's, yet the quality of feeling (for it is merely a quality of feeling) is just the same, whether his own conduct or that of another person real or imaginary is the object of the feeling, or whether it be connected with the thought of any action or not. If conduct is to be thoroughly deliberate, the ideal must be a habit of feeling which has grown up under the influence of a course of self-criticisms and of heterocriticisms; and the theory of the deliberate formation of such habits of feeling is what ought to be meant by *esthetics*. It is true that the Germans, who invented the word, and have done the most toward developing the science, limit it to *taste*, that is, to the action of the *Spieltrieb*, from which deep and earnest emotion would seem to be excluded. But in the writer's opinion, the theory is the same whether it be a question of forming a taste in bonnets or of a preference between electrocution and decapitation, or between supporting one's family by agriculture or by highway robbery. The difference of earnestness is of vast practical moment; but it has nothing to do with heuretic science.

According to this view, Esthetics, Practics, and Logic form one distinctly marked whole, one separate department of heuretic science; and the question

where precisely the lines of separation between them are to be drawn is quite secondary. It is clear, however, that esthetics relates to feeling, practics to action, logic to thought.

B. A *state of things* is an abstract constituent part of reality, of such a nature that a proposition is needed to represent it. There is but one *individual*, or completely determinate, state of things, namely, the all of reality. A *fact* is so highly a prescissively abstract state of things, that it can be wholly represented in a simple proposition, and the term "simple," here, has no absolute meaning, but is merely a comparative expression.

A *mathematical form* of a state of things is such a representation of that state of things as represents only the samenesses and diversities involved in that state of things without definitely qualifying the subjects of the samenesses and diversities. It represents not necessarily all of these; but if it does represent all, it is the *complete* mathematical form. Every mathematical form of a state of things is the complete mathematical form of *some* state of things. The complete mathematical form of any state of things, real or fictitious, represents every ingredient of that state of things except the qualities of feeling connected with it. It represents whatever importance or significance those qualities may have; but the qualities themselves it does not represent.

Before any conclusion shall be made to rest upon this almost self-evident proposition, a way of setting it quite beyond doubt shall be explained. As at present enunciated, it is merely put forward as a private opinion of the writer's which will serve to explain the great interest he attaches to emphatic dualism of the three normative sciences, which may be regarded as being the sciences of the conditions of truth and falsity, of wise and foolish conduct, of attractive and repulsive ideas. Should the reader become convinced that the importance of everything resides entirely in its mathematical form, he, too, will come to regard this dualism as worthy of close attention. Meantime, that it exists, and is more marked in these sciences than in any others, is an indisputable fact. To what is this circumstance to be attributed? Skipping the easy reasoning by which it can be shown that this dualism cannot be due to any peculiar quality of feeling that may be connected with these sciences, nor to any intellectual peculiarity of them, which negative propositions will become obtrusively plain at a later stage of our reasoning, we may turn at once to the affirmative reason for attributing the dualism to the reference of the normative sciences to action. It is curious how this reason seems to seek to escape detection, by putting forward an apparent indication that it is not there. For it is evident that it is in esthetics that we ought to seek for the deepest characteristics of normative science, since esthetics in dealing with the very ideal itself, whose mere materialization engrosses the attention of practics and of logic, must contain the heart, soul, and spirit of normative science. But that dualism which is so much marked in the True and False, logic's object of

study, and in the Useful and Pernicious of the confessional of practics, is softened almost to obliteration in esthetics. Nevertheless, it would be the height of stupidity to say that esthetics knows no good and bad. It must never be forgotten that evil of any kind is none the less bad though *the occurrence of it* be a good. Because in every case the ultimate in some measure abrogates, and ought to abrogate, the penultimate, it does not follow that the penultimate ought not to have abrogated the antepenultimate in due measure. On the contrary, just the opposite follows.

Esthetic good and evil are closely akin to pleasure and pain. They are what would be pleasure or pain to the fully developed superman. What, then, are pleasure and pain? The question has been sufficiently discussed, and the answer ought by this time to be ready. They are secondary feelings or generalizations of such feelings; that is, of feelings attaching themselves to, and excited by, other feelings. A toothache is painful. It *is not* pain, but pain *accompanies* it; and if you choose to say that pain is an ingredient of it, that is not far wrong. However, the quality of the feeling of toothache is a simple, positive feeling distinct from pain; though pain accompanies it. To use the old consecrated terms, pleasure is the feeling that a feeling is "sympathetical," pain that it is "antipathetical." The feeling of pain is a symptom of a feeling which repels us; the feeling of pleasure is the symptom of an attractive feeling. Attraction and repulsion are kinds of action. Feelings are pleasurable or painful according to the kind of action which they stimulate. In general, the good is the attractive, – not to everybody, but to the sufficiently matured agent; and the evil is the repulsive to the same. Mr. Ferdinand C. S. Schiller informs us that he and James have made up their minds that the true is simply the satisfactory. No doubt; but to say "satisfactory" is not to complete any predicate whatever. Satisfactory to what end?

That truth is the correspondence of a representation with its object is, as Kant says, merely the nominal definition of it. Truth belongs exclusively to propositions. A proposition has a subject (or set of subjects) and a predicate. The subject is a sign; the predicate is a sign; and the proposition is a sign that the predicate is a sign of that of which the subject is a sign. If it be so, it is true. But what does this correspondence, or reference of the sign to its object, consist in? The pragmaticist answers this question as follows. Suppose, he says, that the angel Gabriel were to descend and communicate to me the answer to this riddle from the breast of omniscience. Is this supposable; or does it involve an essential absurdity to suppose the answer to be brought to human intelligence? In the latter case, "truth," in this sense, is a useless word, which never can express a human thought. It is real, if you will; it belongs to that universe entirely disconnected from human intelligence which we know as the world of utter nonsense. Having no use for this meaning of the word "truth," we had better use the word in another sense presently to be described. But if, on the other hand, it be conceivable that the secret

should be disclosed to human intelligence, it will be something that thought can compass. Now thought is of the nature of a sign. In that case, then, if we can find out the right method of thinking and can follow it out, – the right method of transforming signs, – then truth can be nothing more nor less than the last result to which the following out of this method would ultimately carry us. In that case, that to which the representation should conform is itself something in the nature of a representation, or sign, – something noumenal, intelligible, conceivable, and utterly unlike a thing-in-itself.

Truth is the conformity of a representamen to its object, – *its* object, ITS object, mind you. The *International Dictionary* at the writer's elbow, the *Century Dictionary* which he daily studies, the *Standard* which he would be glad sometimes to consult, all contain the word "yes"; but that word is not true simply because he is going to ask on this 8th of January, 1906, in Pike County, Pennsylvania, whether it is snowing. There must be an action of the object upon the sign to render the latter true. Without that, the object is not the representamen's object. If a colonel hands a paper to an orderly and says "You will go immediately and deliver this to Captain Hanno," and if the orderly does so, we do not say the colonel told the truth; we say the orderly was obedient, since it was not the orderly's conduct which determined the colonel to say what he did, but the colonel's speech which determined the orderly's action. Here is a view of the writer's house: what makes that house to be the object of the view? Surely not the similarity of appearance. There are ten thousand others in the country just like it. No, but the photographer set up the film in such a way that according to the laws of optics, the film was forced to receive an image of this house. What the sign virtually has to do in order to indicate its object, – and make it its, – is just to seize its interpreter's eyes and forcibly turn them upon the object meant: it is what a knock at the door does, or an alarum or other bell, a whistle, a cannon-shot, etc. It is pure physiological compulsion; nothing else.

So, then, a sign, in order to fulfill its office, to actualize its potency, must be compelled by its object. This is evidently the reason of the dichotomy of the true and the false. For it takes two to make a quarrel, and a compulsion involves as large a dose of quarrel as is requisite to make it quite impossible that there should be compulsion without resistance. So there are two parties, the compeller and the resister.

Thus, this subsection B seems pretty nearly to have accomplished its purpose, which was to outline a way of showing that it is the dualism of the normative sciences wherein is their quintessence. But no, the objector will say, you have perhaps shown that their dualism is an inevitable consequence of their normative character; but to show by any such argument that their normative character is involved in their dualism you would have to maintain that the number two always and everywhere means action and reaction, which, as a man supposed not yet to be clean daft, is a position you probably

will not take. Nor would the objector be at one moment's loss if he were asked to say explicitly just wherein the untenability of that proposition would consist. One would be a victim of something much like a hallucination if one fancied that that mere skeleton of a conception, the number two, were clothed with all the warm flesh of perhaps the most living of all philosophical ideas, the idea of right and wrong. It would be to look at two dots on a sheet of paper, and instead of seeing two little dots, to dream that the eternal battle of life was there prepared, if not actually going on. Well, the writer must evidently abandon his contention if it involves the claim that two dots on a sheet of paper is a rich picture. At the same time, it will be interesting to inquire how the conception of *two* dots is composed. For the unity of apperception requires that that which we conceive should be conceived as one. These dots are to be exactly alike; for we should evidently be adding something to the concept of duality, if we were to conceive them as distinguished by having severally in themselves different qualities each regardless of the other. But since it is thus manifest that duality consists in no quality of both or of either of the members of the pair concerned, it can only consist in a relation between them. To carry the discussion further, and to make out precisely in what that relation consists, requires a pretty thorough acquaintance with logic, since we are not only concerned with the logic of relations, which many of the ordinary treatises hardly touch, but also with the subtle doctrine of the indefinite, and at the same time with collective as opposed to distributive universality. For the relation between two individuals which *duality* implies, – the duality applying to the pair collectively, – is a relation between a single pair of individual objects. Only, this pair is *indefinite*. It is *some* pair. If *A* and *B* be taken to designate the two individuals, the relative term embodying the relation, when expressed in the writer's algebra of 1870 (substantially adopted by Schröder) is

$$A{:}B \quad \Psi \quad B{:}A.$$

This is, of course, an *equiparance*; that is, the relation of *B* to *A* is essentially the same as that of *A* to *B*, so far as the duality of the pair is concerned. But no equiparance whatever, with the exception of the very few that are necessary, such as *identity*, *coexistence*, etc., is a *logically simple relation*. In the case of those equiparances that are *opponencies*, or *juxtambilations*, that is, relations in which something can stand to something else, this is easily shown. Yet even this comparatively facile analysis requires an intellect not without an edge. For considering a non-necessary equiparance in which one individual, *A*, stands to another, *B*, this supposes a contingent determination of *A* by virtue of which it is in some simple relation to *B*. But different individual objects being independent, this may be without *B* having a similar determination putting it into every possible such relation to *A*. Thus, there

must be a possible such determination which does not necessarily imply the equiparance. Now to say that one term, say *u*, is *logically simpler* than another, say *w*, means precisely that the affirmation of *w* concerning any subject implies the affirmative truth of *u* concerning the same subject, while the affirmation of *u* does not reciprocally imply the affirmative truth of *w*; and it may be remarked, by the way, that *disquiparance* is thus necessarily involved in logical simplicity: but we need not argue from that principle. For the above considerations suffice to show that than any contingent equiparant opponency some other relation is logically simpler, and consequently no contingent equiparant opponency is perfectly simple logically; and perfectly simple is what simple means.

Duality is not simple because it involves a contingent equiparant opponency. The constituent elements of that relation will be elements of duality. The relation implied in duality is essentially and purely a dyadic relation. This proposition certainly ought not to pass unchallenged, although examination will sustain it. Are not two lines of this article truly *two*, although there is many another that there is as much reason [to consider]? Precisely that is the pertinent question; and little reflection is required to show that if anybody considers any two lines by themselves, although he may try to select them arbitrarily, there must not only be a reason, but an unmistaken reason why just those and no others are taken. It need not be recognized as such; and if the two lines are only vaguely individualized, – as *some* two, – the reason will be equally vague without thereby ceasing to exist. Nor does this proposition involve any matter of fact: it is a mere formula, that must hold in any universe. Let this proposition, – or rather, this formula, for it carries no positive truths, – be sufficiently considered, and then receive the reader's deliberate and formal assent. That given, he sees that the units of every two are the members of a set, like man and wife, teacher and pupil, the legs of a pair of dividers or of trousers, or the spring lamb and mint sauce, whose comestion and con-coction were decreed before the Fiat Lux.

Relations are truly, though not very lucidly, said to be either relations of reason or relations *in re*. The latter expression the more obtrusively fails to hit its nail squarely on the head. It would be better to say that relations are either dicible or surd. For the only kind of relation which could be veritably described to a person who had no experience of it is a relation of reason. A relation of reason is not purely dyadic: it is a relation through a sign: that is why it is dicible. Consequently the relation involved in duality is not dicible, but surd; and duality must contain as an ingredient of it a surd disquiparance.

This sort of ratiocination by which we determine little by little the characters of the relation sought might be continued almost indefinitely; but after a time, the mind can no longer restrain itself from leaping to a conclusion. It becomes too clear that the real or conceived duality of anything, say of *A* and *B*, consists in the double fact that, really in case the duality is real, conceptually

in case the duality is conceptual, the one, *A*, completes the other, *B*, and reciprocally the latter, *B*, completes the former, *A*. However, a very important modification of this statement must be made, since a conceptual duality is no true duality, inasmuch as it involves a reference to a third correlate, namely, to the conception. Therefore, in the analysis just given, all reference to conceptual relations must be struck out. True duality is a real or surd relation.

One of the most useful and at the same time one of the most arduous of the labours of cenoscopy consists in starting with a familiar but vague concept and searching out and defining the nearest definite concept of sufficient breadth for the purposes of metaphysics. Treating in this way the concept of *action*, and at the same time generalizing it so as not to confine it to temporal conditions, we get a concept which may very well be named *action* in the philosophical sense. It will be defined as a surd dyadic relation by which one correlate, the *patient*, receives a special determination, while the other correlate, the *agent*, receives *thereby*, or perhaps we should say *therein*, no special determination. The determination is *special* in the sense that in default of the relation the patient would not have been so determined. Thus, the completing of *B* by *A* is an action in the philosophical sense, in which *A* is the agent and *B* the patient. Duality consists in such action of *A* upon *B* together with a reciprocal action of the same completing nature of *B* upon *A*.

The double relation of equiparance which constitutes duality is surd. It may be described in words, but those words can only be understood by means of reference to certain experiences; just as a person may be told that a piece of textile fabric is a yard wide, yet can never know what is meant except through an experience immediate or mediate of a certain bar laid up in the Westminster palace. The experiences that acquaint us with action are of two varieties, experiences of active effort and experiences of passive surprise. By an experience of active effort is meant what is in the mind (and a less determinate phrase would be used if any were forthcoming) upon the contraction of a voluntary muscle, *minus* all idea of ulterior purpose, all sensations referred to the muscle that is contracted or to other parts of the body, and all that is otherwise plainly no part of the consciousness of effort. A person may opine that after those subtractions nothing will remain in consciousness; nor will he thereby by any means convict himself of being a bad observer. Nevertheless, such an opinion is erroneous. The sense of effort is the sense of an opposing resistance then and there present. It is entirely different from purpose, which is the idea of a possible general regarded as desirable together with a sense of being determined in one's habitual nature (in one's soul, if you like the expression; it is that part of our nature which takes general determinations of conduct) to actualize it. But the sense of effort is not an idea of anything general or of anything as possible, but of that which actually is; and it never again can be: it is the present. It is not a sensation of any kind; for that is a mere quality of feeling mixed with the sense of a present resistant,

and is passive, not active. The sense of effort is a sense that the source of activity is within one's power. The sensation from the muscle is a sense that the source of a second concomitant activity is beyond one's control. Thus, the sense of active exertion is distinguished from both the concomitants with which even an excellent observer may confound it. The question is difficult, and agreement concerning it must await mature consideration. But the writer has been convinced by various experiments that the distinct character of the sense of active exertion must eventually be acknowledged on all hands. There are certain discriminations which all men make without paying any attention to them, and which perhaps are of no peculiar type, but for which the writer, at least, would be quite at a loss to suggest any probable explanation. One of these, for example, is the discrimination between an excitation of one nerve-terminal and a similar excitation of another terminal. Another is the discrimination between pairs of facts which may possibly be connected and pairs of facts which cannot be connected; although history shows that this power of discrimination is in part a very recent acquisition of civilized man. A third unexplained power is that of discriminating between fact and fancy, between the external and the internal worlds, that which we can, and that which we cannot, control *per nutum*. Possibly this power may be due to every external experience involving more or less genuine surprise. A dream cannot *really* surprise the dreamer: he may (contrary to common belief) *dream that* he is surprised; but the surprise in this case is a dream-illusion.

There are two kinds of surprise: the less passive and the more passive. The former takes place when a person has made an effort in anticipation of experiencing a definite result, and this result does not occur. Although what does occur may be more agreeable than what he had anticipated, still he has a sense of being overcome, since his effort had been made with a view of producing that effect. The more passive surprise is when a sensation of tremendous, or at least of decidedly great, intensity is forced upon his consciousness, overcoming his negative inertia, when he had made no effort to produce such an effect. The two kinds of surprise are often united, a person not only not producing the effect he had anticipated, but being met by a phenomenon which he had not contemplated at all. Thus, a person may wake up in the morning and go to look out of the window, expecting that this action will bring the sight of green fields; but he not only does not see what he did expect but sees what he had never thought of, a covering of snow over everything. The peculiar element in both kinds of surprise is a sense of being the object of a compelling force. "*Je suis saisi*," says the hellenoidal Frenchman. The English-speaker, with his reluctance to confess weakness, only admits, "I am amazed," or "I am flabbergastered" in extraordinary circumstances. His lighter ancestor was more ready to admit himself "astonied." These expressions bespeak one's sense of being in the hands of a power against which it would be hopeless to struggle.

Both active endeavour and passive surprise involve a sense of opposition to an external force. To describe what one is thus aware of is impossible. It is not a thing to be understood. For that which is intelligible is learned gradually in successive lessons, while this is given all at once, and once for all; nor is it any quality of feeling, although there is a feeling involved in surprise, and a feeling involved in the achievement of a difficulty. For a quality of feeling has no identity but resemblance, while this is an event that happens once, and once only. Effort and surprise are the only experiences from which we can derive the concept of action. This concept does not involve duality because *agent* and *patient* are not necessarily objects of the same universe. One may be a form, the other matter. But reciprocal action, – action and reaction, – give duality, however slight the energy of the action may be. For here are two objects which belong together in the sense of being such as they are only as acting upon, and being acted upon by, each other. All inhibition of action, or action upon action, involves reaction and duality. All self-control involves, and chiefly consists in, inhibition. All direction toward an end or good supposes self-control; and thus the normative sciences are thoroughly infused with duality.

C. Philosophers have always been very loose and inaccurate thinkers; and since Fechner's immortal publication of 1860 their minds have been so turned in the direction of psychology that when they have once found how any given element of thought affects the human consciousness, they feel as if they had touched bed-rock and had got to the bottom of that element. But psychology is as special a science as physics is. It is the glory of the post-Fechnerian psychologists that they have made it so. Now to found the science of the general upon the science of the special is absurd.

Logic is no doubt a science of "thought"; but "thought," in that sense, is no more internal than it is external. Logic is the science of truth and falsity. But truth and falsity belong as much to propositions printed in books as to propositions in the human consciousness. The fact that a proposition is conscious or unconscious does not affect its truth or falsity.

But it may be said that logic is the theory of reasoning, and that reasoning can only be performed by a mind. That is certainly true, and must be true; for if anything could independently reason, it would be what we understand by a mind. But it does not follow that the phenomena that psychologists discover have any bearing upon the theory of reasoning. Compare logic with the theory of the behavior of a sailing vessel. A vessel can only sail upon a body of water, and no other liquid, and its sails must be exposed to currents of air, and no other gas. But it does not follow that the theory of sailing depends upon the chemistry of water and of air. But this comparison does not fully expose the impropriety of basing logic upon psychology, because the introduction of the study of the chemistry of air and water would have

no worse effect than that of encumbering the science with irrelevant matter. The attempt to erect a theory of logic upon the work of the psychological laboratory does far worse, since it is extremely dangerous to reason at all about psychology without constant appeals to the science of logic. For example, Christoph Sigwart and others maintain that logical truth consists, in the last analysis, in a certain *feeling*, – he emphasizes its being a quality of feeling, – of logical gratification. And to prove this he appeals to this conclusion of psychology, that in deciding whether a given consequence be logical or not we must always *trust* to that feeling. But if Sigwart and the others had made a sufficient study of exact logic, they would have seen that that principle cannot be a sound inference from observations made in their psychological laboratories. For we cannot trust a feeling as such, since a feeling as such neither is nor utters any proposition to be a subject of trust or distrust. We can only trust a feeling in so far as it is a sign of something else, namely, of a proposition. So, then, Sigwart's argument is that logical truth must consist in a feeling, because that feeling is a sign of something different from itself, namely, that truth.

But suppose he were to shift his ground and say that since this feeling always accompanies logical truth, we might as well identify it with logical truth. Then he may indeed boast that his psychological method has furnished him with an exceedingly simple theory of logic. It makes logic a pure question of feeling, of intellectual taste. *De gustibus non est disputandum.* A feeling is positively such as it is, regardless of aught else. It refers to nothing but itself. That which consists in feeling does not involve any comparison of feelings, or any synthesis of feelings. Properly speaking, because a feeling knows nothing but itself, no feeling can have, or even claim, any authority. It is true that to feeling is often joined passion, which claims autocracy over the whole world; but it is reason, thought, which alone can be the rightful head of government. The man who kindles a heap of shavings on his floor, and *feeling* that it is all right, locks his door and betakes himself to the theatre for the evening, may feel quite differently on his return. But one feeling is entitled to as much weight as another. The only system of logic which can in fact result from the principle that logical truth might as well be regarded as a quality of feeling, is, for the reasons just given, one which allows nothing but feeling to meddle at all with the decision as to what is materially true and what not; and on that principle it can only be said that the man's feeling before the theatre was logically sound for itself, and his contrary feeling on seeing the result of his conduct was equally sound logic for itself.

Logic includes a study of reasoning, it is true, and reasoning may be regarded, – not quite correctly, but we may waive that point, – as a psychical process. If we are to admit that, however, we must say that logic is not an all round study of reasoning, but only of the conditions of reasoning being bad or good, and if good to what degree, and in what application. Now good

reasoning is reasoning which attains its purpose. Its purpose is to supply a guide for conduct, – and thinking, being an active operation, is a species of conduct, – in case no percept from which a judgment could have been directly formed, is at hand. Its object is to say what the reasoner either *will* think when that percept occurs, or what he *would* think if it did occur. The psychological process of reasoning is wholly aside from the purpose of logic.

Logic, says Herbart, psychologist though he was, is a science of *concepts*; but a concept is that which is *conceived*; so that logic is a science of the result of conceiving and has nothing to do with the means whereby the conceiving is performed. In these remarks of Herbart's, *thought* and *thinking* might be substituted for *concept* and *conceiving*. A concept is a symbol present to the imagination, – that is, more correctly speaking, of which a particular instance might be present to the imagination. But the imaginary character of the instance of the symbol has no importance for logic. Its rules hold equally for the symbol embodied in real existents. For it is with the symbol in its general mode of being and not with the individual embodiment of it that logic has to do. The writer, in 1867, defined logic as the science of the formal laws of the relation of symbols to their objects. But a more mature consideration of the nature of the limits between the different branches of science has convinced him that it is better to regard logic as the entire cenoscopic study of symbols, and not only of symbols but of all kinds of signs. It will be felt as a great objection to this view that a sign is not such unless it be interpreted and that it can only be interpreted by the human mind. The reply is that just as physiology explains all the operations of the animal organism purely and exclusively by the principles of general physics, as developed by experiment upon inorganic materials, although these operations cannot be performed without an organism and an organism is something which cannot be put together by means of laboratory appliances, because it has a power of growth which cannot be conferred upon inorganic materials, and this circumstance does not invalidate the physiological explanation; so all the operations of reason can receive perfect logical explanation by principles which apply as much to real signs as to the imaginary signs called concepts, although it is quite true that we cannot make a machine that will reason as the human mind reasons until we can make a logical machine (logical machines, of course, exist) which shall not only be automatic, which is a comparatively small matter, but which shall be endowed with a genuine power of self-control; and we have as little hopes of doing that as we have of endowing a machine made of inorganic materials with life. Indeed, it shall be shown in a future article that these two attributes, *growth* and *self-control*, are confronted with closely analogous difficulties, and further that if we could endow a system of signs with self-control, there is very strong reason to believe that we should thereby have conferred upon it a *consciousness*, even more nearly like that of a man than is, for example, the consciousness of a

fish. But although the proof, or quasi-proof, of that is certainly important, its importance is so far inferior to the matters that this series of papers is designed to discuss that it must wait for its turn to be taken up; and these papers have to be written in the spare time of a hard-driven worker.

What does it mean to speak of the "interpretation" of a sign? Interpretation is merely another word for translation; and if we had the necessary machinery to do it, which we perhaps never shall have, but which is quite conceivable, an English book might be translated into French or German without the interposition of a translation into the imaginary signs of human thought. Still, supposing there were a machine or even a growing tree which, without the interpolation of any imagination were to go on translating and translating from one possible language to a new one, will it be said that the function of signs would therein be fulfilled?

What are signs for, anyhow? They are to communicate ideas, are they not? Even the imaginary signs called thoughts convey ideas from the mind of yesterday to the mind of tomorrow into which yesterday's has grown. Of course, then, these "ideas" are not themselves "thoughts," or imaginary signs. They are some potentiality, some form, which may be embodied in external or in internal signs. But why should this idea-potentiality be so poured from one vessel into another unceasingly? Is it a mere exercise of the World-spirit's *Spiel-trieb*, – mere amusement? Ideas do, no doubt, grow in this process. It is a part, perhaps we may say the chief part, of the process of the Creation of the World. If it has no ulterior aim at all, it may be likened to the performance of a symphony. The pragmaticist insists that this is not all, and offers to back his assertion by proof. He grants that the continual increase of the embodiment of the idea-potentiality is the *summum bonum*. But he undertakes to prove by the minute examination of logic that signs which should be merely parts of an endless viaduct for the transmission of idea-potentiality, without any conveyance of it into anything but symbols, namely, into action or habit of action, would not be signs at all, since they would not, little or much, fulfill the function of signs; and further, that without embodiment in something else than symbols, the principles of logic show there never could be the least growth in idea-potentiality. These two propositions remain to be proved, although a mind of vigorous and healthy intellectual impulses may have to put on the brakes to restrain himself from rushing into the embrace of the former in advance of demonstration's sanction.

§9. *What is a sign?* This is a question of no ordinary difficulty, to which the answer must be sought by a well-considered method. To begin with, let us consider what the question means; and first, What is its general nature? We are not studying lexicography. It is the same sort of question as two which have already been considered, the questions, What is *two*? and, What is *action*? We all have a ragged-outlined notion of what we call a sign. We

wish to replace that by a well-defined concept, which may exclude some things ordinarily called signs, and will almost certainly include some things not ordinarily so called. For that our new concept may have the highest utility for the science of logic, which is the purpose of the investigation, the terms of the definition must be strictly relevant to logic. As far as this condition will allow, it is to express that which is most essential in the vulgar notion of a sign or representamen. Now a sign as ordinarily understood is an implement of intercommunication; and the essence of an implement lies in its function, that is, in its purpose together with the general idea, – not, however, the plan, – of the means of attaining that purpose. The reader will perhaps have noted that the phrase "medium of communication" is broader than the noun "sign," embracing for example a sentence in the imperative mood, which would be characterized as a "signal" rather than as a "sign." Whether or no such a thing as melody, regarded, not as a *symptom* of an emotion or other feeling, but as an *excitant* of the same, would be called a "medium of communication," it certainly would lie without the *Umfang* of "sign." Now it is rather desirable that our sought concept should have a somewhat greater breadth than is strictly necessary for our purpose, on the principle that the surroundings of anything whatever aid to a comprehension of the surrounded object, and certainly in case of doubt we should prefer to include what may be needless rather than exclude anything needed. A too wide concept can do no harm whatever, provided that a careful division of it be made.

Let it be repeated that all the terms of the division must be strictly relevant to logic, and that consequently all accidents of experience, however universal, must be excluded. The result of this rule will necessarily be that the new concept of a "sign" will be defined exclusively by the forms of its logical relationships; and the utmost pains must be taken to understand those relations in a purely formal, or, as we may say, in a purely mathematical way.

At this point, some such question as the following may suggest itself: Is this new scientific concept of a Sign not to recognize the connection of every sign with two minds? The proper reply would first point out that two separate minds are not requisite for the operation of a sign. Thus the premisses of an argument are a sign of the truth of the conclusion; yet it is essential to argument that the same mind that thinks the conclusion *as such* should also think the premisses. Indeed, two minds in communication are, in so far, "at one," that is, are properly one mind in that part of them. That being understood, the answer to the question will go on to recognize that every sign, – or, at any rate, nearly every one, – is a determination of something of the general nature of a mind, which we may call the "quasi-mind." But the further consideration of the nature of this must be put off to the next section.

The writer knows no more handy phrase to describe the kind of analysis we are attempting than "logical analysis." It is a designation just tolerably apt. It is not accurate. For in this work we should wind ourselves up in

apparent antinomies if we allowed dual distinctions to be as absolute as they are in the normative sciences. We are now in the realm of phaneroscopy, the first of the three main divisions of cenoscopy. It is not yet time to define it; but it approaches somewhat to the nature of mathematics. In mathematics, the negative of quantity is *zero*; but instead of being set over against quantity as its eternal foe, it is regarded as merely the limit of quantity, and in a sense as itself a special grade of quantity. This is no violation of the principle of contradiction: it is merely regarding the negative from another point of view. There are some languages in which two negatives make an affirmative. Those are the logical languages. The people who speak them ought, for consistency, to be hard, moral natures. In other languages, probably the majority, a double negative remains a negative, just as $0 \times 0 = 0$, none of none is none. These are quantitative languages. We should expect the people who speak them to be more humane and more highly philosophical. The fact is mentioned here merely to show that the quantitative view of negation, though it is not the view of the hard moralist, nor of the hard logician, does not really involve any bad reasoning. Did it ever occur to the gentle reader that in ordinary algebra we seldom write that one quantity is *unequal* to another: we simply write what else it equals? The general phenomenon throughout mathematics is that almost every strongly marked concept has border concepts which lose the strong characteristics but are included in a broader concept. Thus a conic curve, considered as a curve of the second order, includes as a case of it two intersecting rays, with which a hyperbola may indefinitely approach coincidence, and this figure again includes, and may indefinitely approximate to, one double ray with a nodal point upon it. But a conic can equally well be conceived as a curve of the second class, and as such, it will not include the two intersecting rays, but will include a pair of points with the ray joining them, considered as a double tangent; and the tangents of a very narrow ellipse or hyperbola will indefinitely approach that as their envelope; and this figure again will indefinitely approach a double point with a ray through it; so that one line with one point upon it can be conceived either as a curve of the second order or as a curve of the second class. These colorless borders (if the expression be allowed) of highly colored concepts are, in mathematics, well called "degenerate forms." Not that the two rays in a plane present any particular degeneracy; but when the pair is offered as a case of a conic, it is manifest that all the beautiful relations that characterize genuine conics have, in this form, quite petered out. The same phenomenon presents itself in the realm of phaneroscopy to such an extent that the only successful way of analyzing any of the concepts which belong peculiarly to this realm is, not to begin by considering that concept in all its breadth, but rather to confine oneself, at first, to its highly characterized form, and when that has been thoroughly comprehended, to inquire by what modifications the bordering forms attach themselves to it.

But this rule must not be understood as conflicting with the plan of examining the highest and most general concepts first. However, until special instances are before us, abstract descriptions can hardly be understood.

A sign is plainly a species of medium of communication, and medium of communication is a species of medium, and a medium is a species of third. A genuine third is something which differs from a first in one respect and from a second in another respect. If this other respect is a contrary respect, the third is a medium. Hence in Latin, where "medium" is a vernacular word, the distinction between it and "tertium" is slight. Thus the *principium exclusi medii* is indifferently, though more correctly, called *principium exclusi tertii.*

A triadic relation is most appropriately expressed in a proposition whose subject Nominative denotes the most active correlate, which we may call *N*, which acts upon a more or less similar correlate, *A*, denoted by the direct object or Accusative of the sentence, and at the same time upon something, *D*, of a different kind, denoted by the indirect object, which will be most appropriately put in the Dative. There will, of course, be three dyadic relations, between *N* and *A*, *N* and *D*, and *A* and *D*; but a genuine triadic relation does not consist in any or all of these. It may here be remarked that Combination is a triadic relation between the two elements (for every Combination results from successive couplings) and the result, and is in so far genuine that it cannot be analyzed into any Combination of dyadic relations. But Combination is not a thoroughly genuine triadic relation, since the different elements, the Combinants, are (as far as the mere relation of combination goes) in precisely the same relation to the result, the Combinate.

A medium of communication is something, *A*, which being acted upon by something else, *N*, in its turn acts upon something, *I*, in a manner involving its determination by *N*, so that *I* shall thereby, through *A* and only through *A*, be acted upon by *N*. We may purposely select a somewhat imperfect example. Namely, one animal, say a mosquito, is acted upon by the entity of a zymotic disease, and in its turn acts upon another animal, to which it communicates the fever. The reason that this example is not perfect is that the active medium is in some measure of the nature of a *vehicle*, which differs from a medium of communication, in acting upon the transported object and determining it to a changed location, where, without further interposition of the vehicle, it acts upon, or is acted upon by, the object to which it is conveyed. A sign, on the other hand, just in so far as it fulfills the function of a sign, and none other, perfectly conforms to the definition of a medium of communication. It is determined by the object, but in no other respect than goes to enable it to act upon the interpreting quasi-mind; and the more perfectly it fulfills its function as a sign, the less effect it has upon that quasi-mind other than that of determining it as if the object itself had acted upon

it. Thus, after an ordinary conversation, a wonderfully perfect kind of sign-functioning, one knows what information or suggestion has been conveyed, but will be utterly unable to say in what words it was conveyed, and often will think it was conveyed in words, when in fact it was only conveyed in tones or in facial expressions.

It seems best to regard a sign as a determination of a quasi-mind; for if we regard it as an outward object, and as addressing itself to a human mind, that mind must first apprehend it as an object in itself, and only after that consider it in its significance; and the like must happen if the sign addresses itself to any quasi-mind. It must begin by forming a determination of that quasi-mind, and nothing will be lost by regarding that determination as the sign. So, then, it is a determination that really acts upon that of which it is a determination, although *genuine* action is of one thing on another. This perplexes us, and an example of an analogous phenomenon will do good service here. Metaphysics has been said contemptuously to be a fabric of metaphors. But not only metaphysics, but logical and phaneroscopical concepts need to be clothed in such garments. For a pure idea without metaphor or other significant clothing is an onion without a peel.

Let a community of quasi-minds consist of the liquid in a number of bottles which are in intricate connexion by tubes filled with the liquid. This liquid is of complex and somewhat unstable mixed chemical composition. It also has so strong a cohesion and consequent surface-tension that the contents of each bottle take on a self-determined form. Accident may cause one or another kind of decomposition to start at a point of one bottle producing a molecule of peculiar form, and this action may spread through a tube to another bottle. This new molecule will be a determination of the contents of the first bottle which will thus act upon the contents of the second bottle by continuity. The new molecule produced by decomposition may then act chemically upon the original contents or upon some molecule produced by some other kind of decomposition, and thus we shall have a determination of the contents that actively operates upon that of which it is a determination, including another determination of the same subject.

But it is high time we insured ourselves against snares by determining the precise sense which we are to attach to the term *determination*, and to set in order the terminology of its mental vicinity. A few pages were given to this work in last October's *Monist* (Vol. XV, pp. 487–490); but those remarks require supplementation. Determination, in general, was not defined at all; and the attempt at defining the determination of a subject with respect to a character only covered (or seemed only to cover) explicit propositional determination. An incidental remark (p. 488) to the effect that words whose meaning should be determinate would leave "no latitude of interpretation" was more satisfactory, since the context made it plain that there must be no such latitude either for the interpreter or for the utterer. The explicitness of

the words would leave the utterer no room for explanations of his meaning. This definition has the advantage of being applicable to a command, to a purpose, to a medieval substantial form; in short to anything capable of indeterminacy.[2] Even a future event can only be determinate in so far as it is a consequent. Now the concept of a consequent is a logical concept. It is derived from the concept of the conclusion of an argument. But an argument is a sign of the truth of its conclusion; its conclusion is the rational *interpretation* of the sign. This is in the spirit of the Kantian doctrine that metaphysical concepts are logical concepts applied somewhat differently from their logical application. The difference, however, is not really as great as Kant represents it to be, and as he was obliged to represent it to be, owing to his mistaking the logical and metaphysical correspondents in almost every case.

Another advantage of this definition is that it saves us from the blunder of thinking that a sign is indeterminate simply because there is much to which it makes no reference; that, for example, to say, "C. S. Peirce wrote this article," is indeterminate because it does not say what the color of the ink used was, who made the ink, how old the father of the ink-maker was when his son was born, nor what the aspect of the planets was when that father was born. By making the definition turn upon the interpretation, all that is cut off. At the same time, it is tolerably evident that the definition, as it stands, is not sufficiently explicit, and further, that at the present stage of our inquiry it cannot be made altogether satisfactory. For what is the interpretation alluded to? To answer that convincingly would be either to establish or to refute the doctrine of pragmaticism. Still some explanations may be made. Every sign has a single object, though this single object may be a single set or a single continuum of objects. No general description can identify an object. But the common sense of the interpreter of the sign will assure him that the object must be one of a limited collection of objects. Suppose, for example, two Englishmen to meet in a continental railway carriage. The total number of subjects of which there is any appreciable probability that one will speak to the other perhaps does not exceed a million; and each will have perhaps half that million not far below the surface of consciousness, so that each unit of it is ready to suggest itself. If one mentions Charles the Second, the other need

[2] That everything indeterminate is of the nature of a sign can be proved inductively by imagining and analyzing instances of the surdest description. Thus, the indetermination of an event which should happen by pure chance without cause, *sua sponte*, as the Romans mythologically said, *spontanément* in French (as if what was done of one's own motion were sure to be irrational), does not belong to the event, – say, an explosion, – *per se*, or as explosion. Neither is it by virtue of any real relation: it is by virtue of a relation of reason. Now what is true by virtue of a relation of reason is representative, that is, is of the nature of a sign. A similar consideration applies to the indiscriminate shots and blows of a Kentucky free fight.

not consider what possible Charles the Second is meant. It is no doubt the English Charles Second. Charles the Second of England was quite a different man on different days; and it might be said that without further specification the subject is not identified. But the two Englishmen have no purpose of splitting hairs in their talk; and the latitude of interpretation which constitutes the indeterminacy of a sign must be understood as a latitude which might affect the achievement of a purpose. For two signs whose meanings are for all possible purposes equivalent are absolutely equivalent. This, to be sure, is rank pragmaticism; for a purpose is an affection of action.

What has been said of subjects is as true of predicates. Suppose the chat of our pair of Englishmen had fallen upon the color of Charles II's hair. Now that colors are seen quite differently by different retinas is known. That the chromatic sense is much more varied than it is positively known to be is quite likely. It is very unlikely that either of the travellers is trained to observe colors or is a master of their nomenclature. But if one says that Charles II had dark auburn hair, the other will understand him quite precisely enough for all their possible purposes; and it will be a determinate predication.

The October remarks made the proper distinction between the two kinds of indeterminacy, viz: indefiniteness and generality, of which the former consists in the sign's not sufficiently expressing itself to allow of an indubitable determinate interpretation, while the latter turns over to the interpreter the right to complete the determination as he pleases. It seems a strange thing, when one comes to ponder over it, that a sign should leave its interpreter to supply a part of its meaning; but the explanation of the phenomenon lies in the fact that the entire universe, – not merely the universe of existents, but all that wider universe, embracing the universe of existents as a part, the universe which we are all accustomed to refer to as "the truth," – that all this universe is perfused with signs, if it is not composed exclusively of signs. Let us note this in passing as having a bearing upon the question of pragmaticism.

The October remarks, with a view to brevity, omitted to mention that both indefiniteness and generality might primarily affect either the logical breadth or the logical depth of the sign to which they belong. It now becomes pertinent to notice this. When we speak of the depth, or signification, of a sign, we are resorting to hypostatic abstraction, that process whereby we regard a thought as a thing, make an interpretant sign the object of a sign. It has been a butt of ridicule since Molière's dying week, and the depth of a writer on philosophy can conveniently be sounded by his disposition to make fun of the basis of voluntary inhibition, which is the chief characteristic of mankind. For cautious thinkers will not be in haste to deride a kind of thinking that is evidently founded upon observation, – namely, upon observation of a sign. At any rate, whenever we speak of a predicate we are representing a thought as a thing, as a *substantia*, since the concepts of *substance* and *subject* are one, its concomitants only being different in the two cases. It is needful to remark this

in the present connection, because, were it not for hypostatic abstraction, there could be no generality of a predicate, since a sign which should make its interpreter its deputy to determine its signification at his pleasure would not signify anything, unless *nothing* be its significate. But hypostatic abstraction (the product of which may be termed a *hypostasis*) renders general classes of predicates possible, and classes of those classes, and so on, in a manner which the dull and lazy brood of modern logicians has failed to investigate sufficiently, not to say altogether. Oh, it maddens one to think how ignorant, – and in many respects, doubtless, far worse than ignorant, – their criminal neglect has left us. Only think what legions of good-for-nothing bummers have written logic-books without bestirring themselves to repay their debt to the Greeks and to the medieval doctors by adding a single sentence of new truth to the science! It is not the fashion now even for our Platos to believe in a day of judgment; but remember, Reader, that if a logical talent has been given to you, you cannot maturely reflect upon your situation without coming to intend to deal with posterity as you would that your predecessors had dealt with you.[3]

As an example, we may suppose that one of our two travellers informs the other that Charles II's hair was dark auburn. This would undoubtedly refer, not to the color, in the scientific sense, but to the color-*sensation*, and to this sensation as it becomes modified by unconscious quasi-judgments, that is, judgments unrecognized as modifying the immediate feeling; but it will be convenient to call this "color," as the Englishman himself, presuming him not to be a scientific man, would doubtless have done. The predicate "light auburn" would be sufficiently determinate. But had he said the hair was "colored," that would have been vague to the point of idiocy. Color has its hue, its chroma, or height of color, and its luminosity. A concept of color of any one hue, of any one chroma, or of any one luminosity is a concept of color somewhat indeterminate. As the predicate of a proposition concerning a colored object, it would be somewhat *vague*; in the predicate of an imperative sentence, as "paint this in a dark color," it would be *general*, since it leaves the interpreter free to give the other two coefficients of the color any determination that may suit him. As for hue, chroma, and luminosity, themselves, which we term *respects*, they are merely terms of second intention, somewhat like the biological words *variety*, *species*, *genus*, *family*, *order*, *class*, and *branch*. That is, any one of them describes the nature of the indeterminacy of a predicate. The biological words, in their only universally recognized significations, indicate the *relative quantity* of the indeterminacy of terms of first intention like pouter, dove, passerine, bird, vertebrate, etc., while the chromatic words express the *quality* of the indeterminacy of terms of first

[3] If the writer has fulfilled this duty, it has been no more an act of virtue than is the usual obedience to the common command in the 28th verse of Genesis.

intention such as green, high color, tinted. Both series are of proper predicates of predicates. They agree also in that each has its tolerably close analogues through a wide range of predicates. A hierarchical series, more or less like the biological, is a necessary result of any eventful evolution of class-characters. Louis Agassiz argued with great force that the biological hierarchy expresses, or should express, the various stages of the execution of a purpose; but whoever has read *The World and the Individual* will understand (despite the not unimportant logical slips of that work) that purpose is the very fatherland of evolution. When, on the other hand, classification has a mathematical origin, as seems to be the case with that of the chemical elements, for example, cross-classifications are common, if not usual. Throughout a class of cases which could be logically defined, were there space for the discussion, but of which it will be sufficient to say that it embraces the qualities of each of our well-marked senses, there is a triad of respects analogous to luminosity, hue, and chroma. It will be remarked that in the *habitat* of a respect, or the general subject in which it is found, we have a logical concept of a different kind from any of those mentioned before.[4] We may formulate these chromatic respects by saying that the luminosity is the quantity, the more-or-less-ness, – meaning that whether the measurement be hyperbolic, parabolic, or elliptical is beside the meaning, – of the quality; that the hue is the *suchness* of the quality; and that the chroma is the *such-degree* of the quality. But these phrases are the merest ghosts, without explanation. In particular, the reader may well be at a loss to know what distinction can be made between quality and "suchness."

We are treading here the very littoral of our knowledge of logic. Every step has to be taken with caution for there are quicksands all about. Yet it is just the ground where many writers love to prance, overconfident and rash. If they did not speedily quit the subject, they would soon find how they had entrapped themselves, and would be drowned in the rising tide of the great ocean of doubt and ignorance. No satisfactory account has ever been given of the logical nature of a hypostasis. Take, as an example, a very precise abstract term; say, *hardness*. One may hesitate to say whether the single object denoted by this term, that is, the quality of hardness, is a capacity or a habit; the *possibility* that its subject should sustain the moderate pressure of a knife-edge drawn over it without being scratched, or the *impossibility* of its being scratched by the moderate pressure of the knife-edge. For having no experience of substances whose rasibility is as uncertain as the throw of a die, we can appeal to no instance to show whether we should call such an object

[4] Only so much as seems pertinent to the business in hand is here given of a subject, one of a number equally extensive which have been worked out by the author; and the publication of his work, no matter what blunders he may have committed, must be of ultimate utility to human thought. But it will soon be too late to think of publication.

hard or not. But one illuminating phenomenon we can note; namely, that *hard* is one of a whole category of predicates which appear to be invariably true under circumstances capable of being generally described, and are invariably false when that general condition is not fulfilled. The opinion that this phrase "appear to be" ought to read "are," and that it is not a category of predicates but all predicates whatever of which this holds good, is held by very many logicians, and especially by nominalists, who are, oddly enough, most unwarrantably addicted to universal assertions, for all their maintaining that universality is a mere figment or, at best, a mere subjective appearance.

Nobody, however, has ever found any law, reason, or rhyme according to which such and such points of the heavens are occupied with stars, or for any other fact of existence. Existence can be traced back to a metamorphosis, but the existence did not begin with the metamorphosis; and there is no single instance in which any law has ever been found to regulate with precision the when and where of existence. That the chemical elements of the atmosphere should have low atomic weights and that elements of high atomic weights should be rare in the earth's crust is roughly true, as a mere consequence of the association of specific weight with atomic weight; but to suppose that there is any exact law as to arrangements of existents is a well-recognized mark of a mind not sanely loyal to truth of fact. Men's minds are confused by a looseness of language and of thought which leads them to talk of the causes of single events. They ought to consider that it is not the single actuality, in its identity, which is the subject of a law, but an ingredient of it, an indeterminate predicate. Consequently, the question is, not whether each and every event is precisely caused, in one respect or another, but whether every predicate of that event is caused. For instance, a man bets upon the toss of a coin. He wins his bet. Now the question is whether there was any circumstance about the toss of that coin which necessitated this character of it; namely, its accordance with his bet. There are those who believe that such predicates are precisely determinate; but rational proof fails them. The majority of men call such things uncaused; and this opinion is powerfully supported by the utter failure of every attempt to base predictions of such occurrences upon any specified law. The class of predicates is one of which every man on earth for several thousand years has had multiplied hourly experience; and since in no case has there been any promising appearance of approach to a law, we are more than justified in saying that precise dependence upon general conditions appears to be limited to a category of predicates, without undertaking to say what category that is.

PRAGMATISM

Charles S. Peirce. "Pragmatism." MS 318, Spring 1907.

Composed in early spring 1907, Peirce had hoped to publish this text either in *The Nation* or in the *Atlantic Monthly*. The third version of one of his most ambitious essays on pragmatism, this text is extracted from MS 318 in Richard S. Robin's *Annotated Catalogue of the Papers of Charles S. Peirce* and preserved in the Houghton Library, Harvard University.

Mr. Editor:

The philosophical journals, the world over, are just now brimming over, as you know, with pragmatism and antipragmatism. The number of *Leonardo* that reaches me this morning has an admirable piece on the subject by a writer of genius and of literary skill, Giovanni Papini. Yesterday brought news of discussions along the same line in New Zealand. Often, however, one hears glib utterances that betray complete misunderstanding of this new ingredient of the thought of our time; so that I gladly accept your invitation to explain what pragmatism really is, how it came into being, and whither it is tending.

Any philosophical doctrine that should be completely new could hardly fail to prove completely false; but the rivulets at the head of the river of pragmatism are easily traced back to almost any desired antiquity. Socrates bathed in these waters. Aristotle rejoices when he can find them. They run, where least one would suspect them, beneath the dry rubbish-heaps of Spinoza. Those clean definitions that strew the pages of the *Essay concerning Humane Understanding* (I refuse to reform the spelling) had been washed out in these same pure springs. It was this medium, and not tar-water, that gave health and strength to Berkeley's earlier works, his *Theory of Vision* and what remains of his *Principles*. From it the general views of Kant derive such clearness as they have. Auguste Comte made still more, – much more, – use of this element; as much as he saw his way to using. Unfortunately, however, both he and Kant, in their rather opposite ways, were in the habit of mingling these sparkling waters with a certain mental sedative to which many men are addicted, – and the burly businessmen very likely to their benefit, – but

which plays sad havoc with the philosophical constitution. I refer to the habit of cherishing contempt for the close study of logic.

So much for the past. The ancestry of pragmatism is respectable enough; but the more conscious adoption of it as *lanterna pedibus* in the discussion of dark questions, and the elaboration of it into a method in aid of philosophic inquiry came, in the first instance, from the humblest *souche* imaginable. It was in the earliest seventies that a knot of us young men in Old Cambridge, calling ourselves, half-ironically, half-defiantly, 'The Metaphysical Club', – for agnosticism was then riding its high horse, and was frowning superbly upon all metaphysics, – used to meet, sometimes in my study, sometimes in that of William James. It may be that some of our old-time confederates would today not care to have such wild-oats-sowings made public, though there was nothing but boiled oats, milk, and sugar in the mess. Mr. Justice Holmes, however, will not, I believe, take it ill that we are proud to remember his membership; nor will Joseph Warner Esq. Nicholas St. John Green was one the most interested fellows, a skillful lawyer and a learned one, a disciple of Jeremy Bentham. His extraordinary power of disrobing warm and breathing truth of the draperies of long worn formulas was what attracted attention to him everywhere. In particular, he often urged the importance of applying Bain's definition of belief, as "that upon which a man is prepared to act." From this definition, pragmatism is scarce more then a corollary; so that I am disposed to think of him as the grandfather of pragmatism. Chauncey Wright, something of a philosophical celebrity in those days, was never absent from our meetings. I was about to call him our corypheus; but he will better be described as our boxing-master whom we, – I, particularly, – used to face to be severely pummelled. He had abandoned a former attachment to Hamiltonianism to take up with the doctrines of Mill, to which and to its cognate agnosticism he was trying to weld the really incongruous ideas of Darwin. John Fiske and, more rarely, Francis Ellingwood Abbot, were sometimes present, lending their countenances to the spirit of our endeavours, while holding aloof from any assent to their success. Wright, James, and I were men of science, rather scrutinizing the doctrines of the metaphysicians on their scientific side than regarding them as very momentous spiritually. The type of our thought was decidedly British. I, alone of our number, had come upon the threshing-floor of philosophy through the doorway of Kant, and even my ideas were acquiring the English accent.

Our metaphysical proceedings had all been in winged words (and swift ones, at that, for the most part) until at length, lest the club should be dissolved without leaving any material *souvenir* behind, I drew up a little paper expressing some of the opinions that I had been urging all along under the name of pragmatism. This paper was received with such unlooked for kindness, that I was encouraged, some half-dozen years later, on the invitation of the great publisher, Mr. W. H. Appleton, to insert it, somewhat expanded,

in the *Popular Science Monthly* for November 1877 and January 1878, not with the warmest possible approval of the Spencerian editor, Dr. Edward Youmans. The same paper appeared the next year in a French redaction in the *Revue Philosophique* (Vol. VI, p. 553; Vol. VII, p. 39). In those medieval times, I dared not in type use an English word to express an idea unrelated to its received meaning. The authority of Mr. Principal Campbell weighed too heavily upon my conscience. I had not yet come to perceive, what is so plain today, that if philosophy is ever to stand in the ranks of the sciences, literary elegance must be sacrificed, – like the soldier's old brilliant uniforms, – to the stern requirements of efficiency, and the philosophist must be encouraged, – yea, and required, – to coin new terms to express such new scientific concepts as he may discover, just as his chemical and biological brethren are expected to do. Indeed, in those days, such brotherhood was scorned, alike on the one side and on the other; – a lamentable but not surprising state of scientific feeling. As late as 1893, when I might have procured the insertion of the word pragmatism in the *Century Dictionary*, it did not seem to me that its vogue was sufficient to warrant that step.

It is now high time to explain what pragmatism is. I must, however, preface the explanation by a statement of what it is not, since many writers, especially of the starry host of Kant's progeny, in spite of pragmatists' declarations, unanimous, reiterated, and most explicit, still remain unable to 'catch on' to what we are driving at, and persist in twisting our purpose and purport all awry. I was long enough, myself, within the Kantian fold to comprehend their difficulty; but let it go. Suffice it to say once more that pragmatism is, in itself, no doctrine of metaphysics, no attempt to determine any truth of things. It is merely a method of ascertaining the meanings of hard words and of abstract concepts. All pragmatists of whatsoever stripe will cordially assent to that statement. As to the ulterior and indirect effects of practising the pragmatistic method, that is quite another affair.

All pragmatists will further agree that their method of ascertaining the meanings of words and concepts is no other than that experimental method by which all the successful sciences (in which number nobody in his senses would include metaphysics) have reached the degrees of certainty that are severally proper to them today; – this experimental method being itself nothing but a particular application of an older logical rule, "By their fruits ye shall know them."

Beyond these two propositions to which pragmatists assent *nem. con.*, we find such slight discrepancies between the views of one and another declared adherents as are to be found in every healthy and vigorous school of thought in every department of inquiry. The most prominent of all our school and the most respected, William James, defines pragmatism as the doctrine that the whole "meaning" of a concept expresses itself either in the shape of conduct to be recommended or of experience to be expected. Between this definition

and mine there is certainly a slight theoretical divergence, which, for the most part, becomes evanescent in practice; and though we may differ on important questions of philosophy, – especially as regards the infinite and the absolute, – I am inclined to think that the discrepancies reside in other than the pragmatistic ingredients of our thought. If pragmatism had never been heard of, I believe the opinions of James on one side, of me on the other would have developed substantially as they have; notwithstanding our respective ways of connecting them at present with our conception of that method. The brilliant and marvellously human thinker, Mr. F. C. S. Schiller, who extends to the philosophic world a cup of nectar stimulant in his beautiful *Humanism*, seems to occupy ground of his own, intermediate, as to this question, between those of James and mine.

I understand pragmatism to be a method of ascertaining the meanings, not of all ideas, but only of what I call "intellectual concepts," that is to say, of those upon the structure of which arguments concerning objective fact may hinge. Had the light which, as things are, excites in us the sensation of blue, always excited the sensation of red, and *vice versa*, however great a difference that might have made in our feelings, it could have made none in the force of any argument. In this respect, the qualities of hard and soft strikingly contrast with those of red and blue; because while red and blue name mere subjective feelings only, hard and soft express the factual behavior of the thing under the pressure of a knife-edge. [I use the word "hard" in its strict mineralogical sense, "would resist a knife-edge."] My pragmatism, having nothing to do with qualities of feeling, permits me to hold that the predication of such a quality is just what it seems, and has nothing to do with anything else. Hence, could two qualities of feeling everywhere be interchanged, nothing but feelings could be affected. Those qualities have no intrinsic significations beyond themselves. Intellectual concepts, however, – the only sign-burdens that are properly denominated "concepts," – essentially carry some implication concerning the general behaviour either of some conscious being or of some inanimate object, and so convey more, not merely than any feeling, but more, too, than any existential fact, namely, the "*would-acts*" of habitual behaviour; and no agglomeration of actual happenings can ever completely fill up the meaning of a "would be." But that the *total* meaning of the predication of an intellectual concept consists in affirming that, under all conceivable circumstances of a given kind, the subject of the predication would (or would not) behave in a certain way, – that is, that it either would, or would not, be true that under given experiential circumstances (or under a given proportion of them, taken *as they would occur* in experience) certain facts would exist, – *that* proposition I take to be the kernel of pragmatism. More simply stated, the whole meaning of an intellectual predicate is that certain kinds of events would happen, once in so often, in the course of experience, under certain kinds of existential circumstances.

But how is this pregnant principle to be proved true? For it seems to be in violent contrast to what one will read, let us say, for example, in Mr. Bradley's *Appearance and Reality*, and in the other works of the high metaphysicians; as it no less decidedly conflicts with the simpler doctrines of Haeckel, Karl Pearson, and other nominalists. I might offer half a dozen different demonstrations of the pragmatist principle; but the very simplest of them would be technical and lengthy. It would not be such as a reader of this journal, a student of current literature, could be expected to undertake critically to examine. Such a reader would like to know the color of the thought that supports the positive assertion of pragmatism, without entering too minutely into details. Just such desire I shall endeavour to satisfy, though the smallest sufficient measure of detail will scare away some readers who if they were to persevere would find the detail interesting.

To begin with, every concept and every thought beyond immediate perception is a sign. So much was well made out by Leibniz, Berkeley, and others about two centuries ago. The use of the word λόγος shows that the Greeks, before the development of the science of grammar, were hardly able to think of thought from any other point of view. Let anybody who may desire evidence of the truth of what I am saying just recall the course of what passed in his mind during some recent sincere and fervid self-deliberation. If he is a good introspector, he will remark that his deliberations took a dialogic form, the arguer of any moment appealing to the reasonableness of the *ego* of the succeeding moment for his critical assent. Now, it is needless to say that conversation is composed of signs. Accordingly, we find the sort of mind that is least sophisticated and is surest to betray itself by its language is given to such expressions as "I says to myself, says I," or even to audibly talking to himself, like Launcelot Gobbo, according to the subtle psychologist who created him. Oh, I am confident the reader will grant that every thought is a sign.

Now how would you define a *sign*, Reader? I do not ask how the word is ordinarily used. I want such a definition as a zoologist would give of a fish, or a chemist of a fatty body, or of an aromatic body, – an analysis of the essential nature of a sign, if the word is to be used as applicable to everything which the most general science of semeio´tic must regard as its business to study; be it of the nature of a significant quality, or something that once uttered is gone forever, or an enduring pattern, like our sole definite article; whether it professes to stand for a possibility, for a single thing or event, or for a type of things or of truths; whether it is connected with the thing, be it truth or fiction, that it represents, by imitating it, or by being an effect of its object, or by a convention or habit; whether it appeals merely to feeling, like a tone of voice, or to action, or to thought; whether it makes its appeal by sympathy, by emphasis, or by familiarity; whether it is a single word, or a sentence, or is Gibbon's *Decline and Fall*; whether it is interrogatory, imper-

ative, or assertory; whether it is of the nature of a jest, or is sealed and attested, or relies upon artistic force; and I do not stop here because the varieties of signs are by any means exhausted. Such is the definitum which I seek to fit with a rational, comprehensive, scientific, structural definition, – such as one might give of "loom," "marriage," "musical cadence"; aiming, however, let me repeat, less at what the definitum conventionally does mean, than at what it were best, in reason, that it should mean.

Everybody recognizes that it is no inconsiderable art, this business of "phaneroscopic" analysis by which one frames a scientific definition. As I practice it, in those cases, like the present, in which I am debarred from a direct appeal to the principle of pragmatism, I begin by seizing upon that predicate which appears to be most characteristic of the definitum, even if it does not quite apply to the entire extension of the definitum. If the predicate be too narrow, I afterward seek for some ingredient of it which shall be broad enough for an amended definitum and, at the same time, be still more scientifically characteristic of it.

Proceeding in that way with our definitum, "sign," we note, as highly characteristic, that signs mostly function each between two minds, or theatres of consciousness, of which the one is the agent that *utters* the sign (whether acoustically, optically, or otherwise), while the other is the *patient* mind that *interprets* the sign. Going on with my account of what is characteristic of a sign, without taking the least account of exceptional cases, for the present, I remark that, before the sign was uttered, it already was virtually present to the consciousness of the utterer, in the form of a thought. But, as already remarked, a thought is itself a sign, and should itself have an utterer (namely, the ego of a previous moment), to whose consciousness it must have been already virtually present, and so back. Likewise, after a sign has been interpreted, it will virtually remain in the consciousness of its interpreter, where it will be a sign, – perhaps, a resolution to apply the burden of the communicated sign, – and, as a sign should, in its turn have an interpreter, and so on forward. Now it is undeniably conceivable that a beginningless series of successive utterers should all do their work in a brief interval of time, and that so should an endless series of interpreters. Still, it is not likely to be denied that, in some cases, neither the series of utterers nor that of interpreters forms an infinite collection. When this is the case, there must be a sign without an utterer and a sign without an interpreter. Indeed, there are two pretty conclusive arguments on these points that are likely to occur to the reader. But why argue, when signs without utterers are often employed? I mean such signs as symptoms of disease, signs of the weather, groups of experiences serving as premisses, etc. Signs without interpreters less manifestly, but perhaps not less certainly exist. Let the cards for a Jacquard loom be prepared and inserted, so that the loom shall weave a picture. Are not those cards signs? They convey intelligence, – intelligence that, considering its spirit and pictorial

effect, cannot otherwise be conveyed. Yet the woven pictures may take fire and be consumed before anybody sees them. A set of those models that the designers of vessels drag through the water may have been prepared; and with the set a complete series of experiments may have been made; and their conditions and results may have been automatically recorded. There, then, is a perfect representation of the behaviour of a certain range of forms. Yet if nobody takes the trouble to study the record, there will be no interpreter. So the books of a bank may furnish a complete account of the state of the bank. It remains only to draw up a balance sheet. But if this be not done, while the sign is complete, the human interpreter is wanting.

Having found, then, that neither an utterer, nor even, perhaps, an interpreter is essential to a sign, characteristic of signs as they both are, I am led to inquire whether there be not some ingredient of the utterer and some ingredient of the interpreter which not only are so essential, but are even more characteristic of signs than the utterer and the interpreter themselves. We begin with seeking the essential ingredient of the utterer. By calling this quaesitum an *ingredient* of the utterer, I mean that where this quaesitum is absent the utterer cannot be present; and further that where there is no utterer, it cannot be that this quaesitum together with all the others of a certain body of "ingredients" should all be present. This latter clause, however, has so little importance and is so nearly self-evident that I need not insist upon it. A fact concerning our quaesitum, which we can know in advance of all study, is that, because this quaesitum will function as a sort of substitute for an utterer, in case there be no utterer, or at any rate fulfills nearly the same, but a more essential, function, it follows that since it is not the sign that constructs or voices or represents the utterer, but, on the contrary, the utterer that constructs, voices, and sets forth the sign, therefore, although *ex hypothesi* the quaesitum is something quite indispensible to the functioning of the sign, yet it cannot be fully revealed or brought to light by any study of the sign alone, as such. Knowledge of it must come from some previous or collateral source. Moreover, since it is conceived to act upon the sign, it must be conceived as singular, not general. But perhaps this is not very clear and needs illustration.

Example 1. Suppose I chance to overhear one man at a club say to another "Ralph Pepperill has bought that mare Pee Dee Kew." Never having heard before either of Ralph Pepperill or of Pee Dee Kew, it means to me only that some man has bought some famous trotter; and since I knew already that some men do make such purchases, it does not interest me. But the next day I hear somebody inquire where he can find a copy of Stevens's edition of Plato; to which reply is made that Ralph Pepperill says he has a copy. Now although I never was knowingly acquainted with any purchaser of crack trotting-horses, yet I should not have supposed that such a person would be aware of possessing an old edition of Plato whose chief value is due to the circum-

stance that modern citations from the Dialogues usually refer to it. After this, I begin to pay attention to what I hear of Ralph Pepperill; until, at length, that which the name means to me probably represents pretty fairly what it would mean to an acquaintance of the man. This imparts, not merely an interest, but also a *meaning* to every little scrap of new information about him; – to scraps that would have conveyed no information whatsoever, had they first introduced his name to my ears. Yet the name itself will remain a designation devoid of essential signification, and so much of the accidental kind as it may at any time have acquired will not have been derived, in however slight measure, from the utterer of any sentence which it may furnish with informatory interest; – at least, not from him in his capacity as utterer of that sentence.

Example 2. I remember a blazing July noon in the early sixties when a fellow-student in the chemical laboratory, in whose company I was crossing the Harvard 'College Yard', while the grass shone like emeralds, and the red-brick buildings, not red enough by nature for the taste of the curator, were blazing in a fresh coat of something like vermillion, – when this fellow student casually remarked upon the pleasing harmony of color between the grass, the foliage, and the buildings. With eyes feeling as if their balls were being twisted by some inquisitor, I at first understood the remark as a sorry joke, like the gibes of some Indian captive at the want of skill of his tormentors. But I soon found that it was the utterance of a sincere feeling, and then, by a series of questions, soon discovered that my friend was blind to the red element of color. A man may have learned that he is color-blind; but it is impossible that he should be conscious of the stupendous gulf between his chromatic impressions and those of ordinary men; although it is needful to take account of this in all interpretations of what he may say about colors. In the course of my examination of that young gentleman, which occupied several days, I learned a more general lesson, worth multiples of the time it lost me from the laboratory.

Example 3. Toward the end of a sultry afternoon, three young gentlemen are still lounging together; one in a long chair, one supine upon a lounge, the third standing by the open casement that looks down seven stories upon the Piazza di Spagna from its Pincian side, and seems to be half glancing at the newspaper that has just been brought to him. His is one of those natures that habitually hold themselves within the limits of extreme calm, because they too well know the terrible expense of allowing themselves to be stirred. In a few moments, he breaks the silence with the words, "Verily, it is a terrible fire." What does he mean? The other twain are too lazy to ask. The long-chaired one thinks the utterer was looking at the newspaper when he made his exclamation, and concludes that there has been a conflagration in Teheran, in Sydney, or in some such place, appalling enough to be flashed round the globe. But the couched man thinks the utterer was looking out of the window, and

that there must be a fire down in the Corso, or in that direction. Here is another case in which the whole burden of the sign must be ascertained, not by closer examination of the utterance, but by collateral observation of the utterer.

Example 4. I find (let us suppose) among my books, a quarto volume among the leaves of which an old MS letter has got bound which gives some details about a fire, – apparently a considerable conflagration, since the writer speaks of it as "the fire," as if the addressee could not possibly misidentify it, and since different houses being consumed are mentioned as small details. If it refers to the great fire of London, it is certainly of remarkable interest. But how am I to know whether it does so or not? I need not say that the binder in trimming the edges has cut off the date; since the oath of their trade, as it would seem, must oblige binders to do this whenever the margins carry matter of special interest. I can, therefore, only submit the MS to some experts in diplomatics who can pronounce on the date of the writing and of the paper. In this case, again, the whole significance of the sign depends upon collateral observation.

Example 5. Pronouns are words whose whole object is to indicate what kind of collateral observation must be made in order to determine the significance of some other part of the sentence. "Which" directs us to seek the quaesitum in the previous context; the personal pronouns to observe who is the speaker, who the hearer, etc. The demonstrative pronouns usually direct this sort of observation to the circumstances of the utterance (perhaps to the way a finger points) rather than to the words.

Example 6. Since the most acute minds, in dealing with conceptions unfamiliar to them, will blunder in ways that astonish those who are habituated to such dealings, I will propose, as an additional example, that of a weather-cock. Now a weather-cock is one of those natural signs, like a sign of the weather, which depend upon a physical connection between the sign and that of which it is the sign. But a weather-cock having been devised, as everyone knows, to show which way the wind blows, itself signifies to what it refers; and consequently it may be argued that no collateral observation is called for to complete its significance. But this reasoning commits two faults. In the first place, it confuses two incompatible ways of conceiving of a weather-cock: as a natural sign, and therefore as having no utterer; and as a human contrivance to show the direction of the wind, and as such, uttered by its original inventor [for I speak of the Weather-cock, – the type, not the single instance]. In the second place, the reasoning overlooks the obvious truth that when thoughts are determined or revealed by a sign, the sign exists first (virtually, at any rate), and those thoughts subsequently. Hence, thoughts applied to devise a weather-cock cannot be revealed by the weather-cock, but come under the head of "previous or collateral" information. To this all-sufficient reply, it may be added, by way of surplusage, that prudent persons, in

consulting a weather-cock, watch it to see whether it veers, as a security against the possibility of its being jammed by rust or otherwise, and against its being deflected by any other force than that of the wind.

It is now easy to see that the "*requaesitum*" which we have been seeking is simply that which the sign "stands for," or the idea of that which it is calculated to awaken. We now have a clearer idea of the *requaesitum* than we had, at first, of the "object of the sign." Our remarks may be regarded as attempts to analyze the idea of "standing for" or "representing." The *requaesitum*, when there are both an utterer and an interpreter, is that which the former has in mind, but which it does not occur to him to express, because he well knows that the interpreter will understand that he refers to that, without his saying so. I am speaking of cases in which the sign stands alone without any context. Thus if the utterer says "Fine day!" he does not dream of any possibility of the interpreter's thinking of any mere *desire* for a fine day that a Finn of the North Cape might have entertained on April 19, 1776. He means, of course, to refer to the actual weather, then and there, where he and the interpreter are alike influenced by the fine weather, and have it near the surface of their common consciousness. Marine fossils found on a mountain, considered as a sign of the sea-level having been higher than the levels of deposit of those fossils, refers to a distant but indefinite date. Here, there is no utterer; but this is what might have remained unexpressed in the mind of the utterer, though essential to the significance of the sign, if that sign had been devised and constructed to give the human race a first lesson in geology. Where the sign is only a part of another sign, so that there is a context, it is in that context that the *requaesitum* is likely, in part at least, to be found; though it is not absolutely necessary that it should be found in any part of the sign.

This *requaesitum* I term the *Object* of the sign; – the *immediate* object, if it be the idea which the sign is built upon, the *real* object, if it be that real thing or circumstance upon which that idea is founded, as on bed-rock.

The Object of a Sign, then, is necessarily unexpressed in the sign, taken by itself. Indeed, we shall soon see that whatever is so expressed comes under quite a different category. But the above examples show that that idea which though essential to the functioning of a sign can only be attained by collateral observation is the idea of a strictly individual thing, or individual collection or series, or an individual event, or an individual *ens rationis*. This sufficiently proves the truth of the proposition. There are deeper causative reasons that cannot be given here. The proposition does not amount to so much as it has the air of doing, since whatever actually exists is an individual. For a finite plural is nothing but the singular of an indefinite collective noun; while the endlessness of an infinite collection is of a hypothetical, or ideal, nature, and lacks completed existence. The object of a sign, though singular, may nevertheless be multiple, and may even be infinitely so. Take a verb in the indicative

mood out from its context, and what is its object? What, for example, is the object of "runs"? *Answer:* it is something, a runner. What is the object of "kills"? *Answer:* it is a pair of indesignate individuals, the one a killer, the other killed by him. So "gives" has for its object a triplet of related indesignate singulars, a giver, a gift, a recipient of that gift from that giver. "Buys" is predicated of a quartette composed of the seller, the buyer, the legal right that is transferred from the former to the latter, and the price. The different members of the set which is the object of a verb, – its *partial* objects, as they may be called, – often have distinctive characters which are the same for large numbers of verbs. Thus, the partial objects of an ordinary transitive verb are an agent and a patient. These distinctive characters have nothing to do with the form of verb, as a sign, but are derived from the form of the fact signified. By taking note of this, one may avoid some perplexity when the verb itself expresses the functioning of a sign. For example, one of the partial objects of the verb "expresses" is of course the thing expressed, which in some drowsy moment might seem an instance refuting the principle that the object of a sign cannot be expressed by the sign itself. To avoid the puzzle, one need but note that the verb "expresses" not only *is* a sign, and expresses something, but also signifies the action of a sign, or expresses its expressing something. Its accusative is the object of the outer sign, but not of the other, inner, sign which this outer sign implies.

It should be mentioned that though a sign cannot express its Object, it may describe, or otherwise indicate, the kind of collateral observation by which that Object is to be found. Thus, a proposition whose subject is distributively universal (not plural or otherwise collectively universal), such as "Any man will die," allows the interpreter, after collateral observation has disclosed what single universe is meant, to take any individual of that universe as the Object of the proposition, giving, in the above example, the equivalent "If you take any individual you please of the universe of existent things, and if that individual is a man, it will die." If the proposition had been, "Some Old Testament character was translated," the indication would have been that the individual must be suitably selected, while the interpreter would have been left to his own devices to identify the individual.

Now that we have attained, you and I, Reader, as I hope, a pretty clear notion of what, in strictness of speech, must be meant by the Object of a sign, it becomes pertinent to inquire how far such strictness of speech is practicable and convenient. Of the two loosely synonymous terms, "individual" and "singular," the former translates Aristotle's *τὸ ἄτομον* (see 3a35, about the middle of the 5th chapter of the Categories), the latter his *τὸ καθ' ἕκαστον* (see the 27th chapter of the 1st Prior Analytics, where Cleon and Callias are given as examples). "Individual" is usually and well defined as that which is absolutely determinate; the "singular" is that which is absolutely determinate as long as the time is so, or to generalize this definition, is variable only in two

precisely opposite and converse ways of varying. Now it is quite impossible that any collateral observations, however they might be eked out by imagination or thought, should ever approach a *positive* idea of a singular, let alone an individual; that is, that we should actually think it as determinate in each one of the more than millions of respects in which things may vary. Suppose, for example, that it is visible; and consider only the outline of a single aspect of it. Even though this outline were restricted to being one of a family of curves, say ellipses, the different possible shapes between any two limiting shapes are more than innumerable; for there is a continuum of them. It would be impossible to complete our collateral observation, aided though it were by imagination and thought, even in this one, almost insignificant, respect. It is plainly impracticable, therefore, to restrict the meaning of the term "object of a sign" to the Object strictly so called.

For, after all, collateral observation, aided by imagination and thought, will usually result in some idea, though this need not be particularly determinate; but may be indefinite in some regards and general in others. Such an apprehension, approaching, however distantly, that of the Object strictly so called, ought to be, and usually is, termed the "immediate object" of the sign in the intention of its utterer. It may be that there is no such thing or fact in existence, or in any other mode of reality; but we surely shall not deny to the common picture of a phenix or to a figure of naked truth in her well the name of a "sign," simply because the bird is a fiction and Truth an *ens rationis*.

If there be anything *real* (that is, anything whose characters are true of it independently of whether you or I, or any man, or any number of men think them as being characters of it, or not) that sufficiently corresponds with the immediate object (which, since it is an apprehension, is not real), then whether this be identifiable with the Object strictly so-called or not, it ought to be called, and usually is called, the "real object" of the sign. By some kind of causation or influence it must have determined the significant character of the sign.

So much for the object, or that by which the sign is essentially determined in its significant characters in the mind of its utterer. Corresponding to it there is something which the sign in its significant function essentially determines in its interpreter. I term it the "interpretant" of the sign. In all cases, it includes feelings; for there must, at least, be a sense of comprehending the meaning of the sign. If it includes more than mere feeling, it must evoke some kind of effort. It may include something besides, which, for the present, may be vaguely called "thought." I term these three kinds of interpretant the "emotional," the "energetic," and the "logical" interpretants.

If a sign has no interpreter, its interpretant is a "would be," i.e., is what it *would* determine in the interpreter if there were one. In its general nature, the interpretant is much more readily intelligible than the object, since it includes all that the sign of itself expresses or signifies. But there is some difficulty in

defining the three kinds of interpretant. It may possibly be, for example, that I am taking too narrow a conception of the sign in general in saying that its initial effect must be of the nature of feeling, since it may be that there are agencies that ought to be classed along with signs and yet that at first begin to act quite unconsciously. But since this error, if it be one, does not seem to have anything to do with the subject of pragmatism, I do not now stop to consider it. A much more serious question, especially in the present connection, concerns the nature of that logical interpretant, the conveyed thought, which we easily assure ourselves that some signs have, though we do not straightway discern in what it consists.

I am now prepared to risk an attempt at defining a sign, – since in scientific inquiry, as in other enterprises, the maxim holds, *Nothing hazard, nothing gain.* I will say that a sign is anything, of whatsoever mode of being, which mediates between an object and an interpretant; since it is both determined by the object *relatively to the interpretant*, and determines the interpretant *in reference to the object*, in such wise as to cause the interpretant to be determined by the object through the mediation of this "sign."

The object and the interpretant are thus merely the two correlates of the sign; the one being antecedent, the other consequent of the sign. Moreover, the sign being defined in terms of these correlative correlates, it is confidently to be expected that object and interpretant should precisely correspond, each to the other. In point of fact, we do find that the immediate object and emotional interpretant correspond, both being apprehensions, or are "subjective"; both, too, appertain to all signs without exception. The real object and energetic interpretant also correspond, both being real facts or things. But to our surprise, we find that the logical interpretant does not correspond with any kind of object. This defect of correspondence between object and interpretant must be rooted in the essential difference there is between the nature of an object and that of an interpretant; which difference is that the former antecedes, while the latter succeeds the sign. The logical interpretant must, therefore, be in a relatively future tense.

To this may be added the consideration that it is not all signs that have logical interpretants, but only intellectual concepts and the like; and these are all either general or intimately connected with generals, as it seems to me. This shows that the species of future tense of the logical interpretant is that of the conditional mood, the "*would-be.*"

At the time I was originally puzzling over the enigma of the nature of the logical interpretant, and had reached about the stage where the discussion now is, being in a quandary, it occurred to me that if I only could find a moderate number of concepts which should be at once highly abstract and abstruse, and yet the whole nature of whose meanings should be quite unquestionable, a study of them would go far toward showing me how and why the logical interpretant should in all cases be a conditional future. I had

no sooner framed a definite wish for such concepts, than I perceived that in mathematics they are as plenty as blackberries. I at once began running through the explications of them, which I found all took the following form: Proceed according to such and such a general rule. Then, if such and such a concept is applicable to such and such an object, the operation will have such and such a general result; and conversely. Thus, to take an extremely simple case, if two geometrical figures of dimensionality N should be equal in all their parts, an easy rule of construction would determine, in a space of dimensionality N containing both figures, an axis of rotation, such that a rigid body that should fill not only that space but also a space of dimensionality $N + 1$ containing the former space, turning about that axis, and carrying one of the figures along with it, while the other figure remained at rest, the rotation would bring the movable figure back into its original space of dimensionality N, and when that event occurred, the movable figure would be in exact coincidence with the unmoved one, in all its parts; while if the two figures were not so equal, this would never happen.

Here was certainly a stride toward the solution of the enigma. For the treatment of a score of intellectual concepts on that model, only a few of them being mathematical, seemed to me to be so refulgently successful as fully to convince me that to predicate any such concept of a real or imaginary object is equivalent to declaring that a certain operation, corresponding to the concept, if performed upon that object, would (certainly, or probably, or possibly, according to the mode of predication) be followed by a result of a definite general description.

Yet this does not quite tell us just what the nature is of the essential effect upon the interpreter, brought about by the *semio´sis* of the sign, which constitutes the logical interpretant. [It is important to understand what I mean by *semiosis*. All dynamical action, or action of brute force, physical or psychical, either takes place between two subjects (whether they react equally upon each other, or one is agent and the other patient, entirely or partially) or at any rate is a resultant of such actions between pairs. But by "semiosis" I mean, on the contrary, an action, or influence, which is, or involves, a cooperation of *three* subjects, such as a sign, its object, and its interpretant, this tri-relative influence not being in any way resolvable into actions between pairs. *Σημείωσις* in Greek of the Roman period, as early as Cicero's time, if I remember rightly, meant the action of almost any kind of sign; and my definition confers on anything that so acts the title of a "sign."]

Although the definition does not require the logical interpretant (or, for that matter, either of the other two interpretants) to be a modification of consciousness, yet our lack of experience of any semiosis in which this is not the case, leaves us no alternative to beginning our inquiry into its general nature with a provisional assumption that the interpretant is, at least, in all cases, a sufficiently close analogue of a modification of consciousness to

keep our conclusion pretty near to the general truth. We can only hope that, once that conclusion is reached, it may be susceptible of such a generalization as will eliminate any possible error due to the falsity of that assumption. The reader may well wonder why I do not simply confine my inquiry to psychical semiosis, since no other seems to be of much importance. My reason is that the too frequent practice, by those logicians who do not go to work without any method at all, of basing propositions in the science of logic upon results of the science of psychology, – as contradistinguished from common-sense observations concerning the workings of the mind, observations well known even if little noticed, to all grown men and women that are of sound minds, – that practice is to my apprehension as unsound and insecure as was that bridge in the novel of *Kenilworth* that, being utterly without any sort of support, sent the poor Countess Amy to her destruction; seeing that, for the firm establishment of the truths of the science of psychology, almost incessant appeals to the results of the science of logic, – as contradistinguished from natural perceptions that one relation evidently involves another, – are peculiarly indispensible. Those logicians continually confound *psychical* truths with *psychological* truths, although the distinction between them is of that kind that takes precedence over all others as calling for the respect of anyone who would tread the strait and narrow road that leadeth unto exact truth.

Making that provisional assumption, then, I ask myself, since we have already seen that the logical interpretant is general in its possibilities of reference (i.e., refers or is related to whatever there may be of a certain description), what categories of mental facts there be that are of general reference. I can find only these four: conceptions, desires (including hopes, fears, etc.), expectations, and habits. I trust I have made no important omission. Now it is no explanation of the nature of the logical interpretant (which, we already know, is a concept) to say that it is a concept. This objection applies also to desire and expectation, as explanations of the same interpretant; since neither of these is general otherwise than through connection with a concept. Besides, as to desire, it would be easy to show (were it worth the space) that the logical interpretant is an effect of the energetic interpretant, in the sense in which the latter is an effect of the emotional interpretant. Desire, however, is cause, not effect, of effort. As to expectation, it is excluded by the fact that it is not conditional. For that which might be mistaken for a conditional expectation is nothing but a judgment that, under certain conditions, there would be an expectation: there is no conditionality in the expectation itself, such as there is in the logical interpretant after it is actually produced. Therefore, there remains only habit, as the essence of the logical interpretant.

Let us see, then, just how, according to the rule derived from mathematical concepts (and confirmed by others), this habit is produced; and what sort of

a habit it is. In order that this deduction may be rightly made, the following remark will be needed. It is not a result of scientific psychology, but is simply a bit of the catholic and undeniable common sense of mankind, with no other modification than a slight accentuation of certain features.

Every sane person lives in a double world, the outer and the inner world, the world of percepts and the world of fancies. What chiefly keeps these from being mixed up together is (besides certain marks they bear) everybody's well knowing that fancies can be greatly modified by a certain non-muscular effort, while it is muscular effort alone (whether this be 'voluntary', that is, preintended, or whether all the intended endeavour is to inhibit muscular action, as when one blushes, or when peristaltic action is set up on experience of danger to one's person) that can, to any noticeable degree, modify percepts. A man can be durably affected by his percepts and by his fancies. The way in which they affect him will be apt to depend upon his personal inborn disposition and upon his habits. Habits differ from dispositions in having been acquired as consequences of the principle, virtually well-known even to those whose powers of reflexion are insufficient to its formulation, that multiply reiterated behavior of the same kind, under similar combinations of percepts and fancies, produces a tendency, – the *habit*, – actually to behave in a similar way under similar circumstances in the future. Moreover, – *here is the point*, – every man exercises more or less control over himself by means of modifying his own habits; and the way in which he goes to work to bring this effect about in those cases in which circumstances will not permit him to practice reiterations of the desired kind of conduct in the outer world shows that he is virtually well-acquainted with the important principle that *reiterations in the inner world*, – *fancied reiterations*, – *if well-intensified by direct effort*, *produce habits*, just as do reiterations in the outer world; *and these habits will have power to influence actual behaviour in the outer world*; especially, if each reiteration be accompanied by a peculiar strong effort that is usually likened to issuing a command to one's future self.[1]

[I here owe my patient reader a confession. It is that when I said that those signs that have a logical interpretant are either general or closely connected with generals, this was not a scientific result, but only a strong impression due to a lifelong study of the nature of signs. My excuse for not answering the

[1] I well remember when I was a boy, and my brother Herbert, now our minister at Christiania, was scarce more than a child, one day, as the whole family were at table, some spirit from a "blazer," or "chafing-dish," dropped on the muslin dress of one of the ladies and was kindled; and how instantaneously he jumped up, and did the right thing, and how skillfully each motion was adapted to the purpose. I asked him afterward about it, and he told me that since Mrs. Longfellow's death he had often run over in imagination all the details of what ought to be done in such an emergency. It was a striking example of a real habit produced by exercises in the imagination.

question scientifically is that I am, as far as I know, a pioneer, or rather a backwoodsman, in the work of clearing and opening up what I call *semiotic*, that is, the doctrine of the essential nature and fundamental varieties of possible semiosis; and I find the field too vast, the labor too great, for a first-comer. I am, accordingly, obliged to confine myself to the most important questions. The questions of the same particular type as the one I answer on the basis of an impression, which are of about the same importance, exceed four hundred in number; and they are all delicate and difficult, each requiring much search and much caution. At the same time, they are very far from being among the most important of the questions of semiotic. Even if my answer is not exactly correct, it can lead to no great misconception as to the nature of the logical interpretant. There is my apology, such as it may be deemed.]

It is not to be supposed that upon every presentation of a sign capable of producing a logical interpretant, such interpretant is actually produced. The occasion may either be too early or too late. If it is too early, the semiosis will not be carried so far, the other interpretants sufficing for the rude functions for which the sign is used. On the other hand, the occasion will come too late if the interpreter be already familiar with the logical interpretant, since then it will be recalled to his mind by a process which affords no hint of how it was originally produced. Moreover, the great majority of instances in which formations of logical interpretants do take place are very unsuitable to serve as illustrations of the process, because in them the essentials of this semiosis are buried in masses of accidental and hardly relevant semioses that are mixed with the former. The best way that I have been able to hit upon for simplifying the illustrative example which is to serve as our matter upon which to experiment and observe is to suppose a man already skillful in handling a given sign (that has a logical interpretant) to begin now before our inner gaze for the first time seriously to inquire what that interpretant is. It will be necessary to amplify this hypothesis by a specification of what his *interest* in the question is supposed to be. In doing this, I by no means follow Mr. Schiller's brilliant and seductive humanistic logic, according to which it is proper to take account of the whole personal situation in logical inquiries. For I hold it to be very evil and harmful procedure to introduce into scientific investigation an unfounded hypothesis, without any definite prospect of its hastening our discovery of the truth. Now such a hypothesis Mr. Schiller's rule seems to me, with my present lights, to be. He has given a number of reasons for it; but, to my estimate, they seem to be of that quality that is well calculated to give rise to interesting discussions, and is consequently to be recommended to those who intend to pursue the study of philosophy as an entertaining exercise of the intellect, but is negligible for one whose earnest purpose is to do what in him lies toward bringing about a metamorphosis of philosophy into a genuine science. I cannot turn aside into Mr. Schiller's charming lane. When I ask what the interest is in seeking to discover a logical

interpretant, it is not my fondness for strolling in paths where I can study the varieties of humanity that moves me, but the definite reflexion that unless our hypothesis be rendered specific as to that interest, it will be impossible to trace out its logical consequences, since the way the interpreter will conduct the inquiry will greatly depend upon the nature of his interest in it.

I shall suppose, then, that the interpreter is not particularly interested in the theory of logic, which he may judge by examples to be profitless; but I shall suppose that he has embarked a great part of the treasures of his life in the enterprise of perfecting a certain invention; and that, for this end, it seems to him extremely desirable that he should acquire a demonstrative knowledge of the solution of a certain problem of reasoning. As to this problem itself, I shall suppose that it does not fall within any class for which any general method of handling is known, and that indeed it is indefinite in every respect which might afford any familiar kind of handle by which any image fairly representing it could be held firmly before the mind and examined; so that, in short, it seems to elude reason's application or to slip from its grasp.

Various problems answering this description might be instanced; but to fix our ideas, I will specify one of them, and will suppose that this is the very one which our imaginary inventor wishes to solve. It shall be the following "map-coloring problem": Let a globular body be bored through in two wide holes; and, though it is unnecessary, the edge at each end of each tunnel shall be smoothly rounded off. Then the problem is, supposing its utterer is free to divide the whole surface of this body, – including the surfaces of the bores, – into regions in any way he likes (no region consisting of separated pieces), and supposing that it will then fall to the interpreter to color the whole area of each region in one color, but never giving to two regions that abut along a common boundary-line the same color; required to ascertain what will be the least number of different colors that will always suffice, no matter how the surface may have been divided.

Under the high stimulus of his interest in this problem, and with that practical knack that we have supposed him to possess in coloring maps without too frequently being obliged to go back and alter the colors he had assigned to given regions, we need not doubt that our inquirer will be thrown into a state of high activity in the world of fancies, in experimenting upon coloring maps, while trying to make out what subconscious rule guides him, and renders him as successful as he usually is; and in trying, too, to discover what rule he had violated in each case where his first coloration has to be changed. This activity is, logically, an energetic interpretant of the interrogatory he puts to himself. Should he in this way succeed in working out a determinate rule for coloring every map on the two-tunnelled (or, what is the same thing, the two-bridged) everywhere unbounded surface with the fewest possible colors, there will be good hope that a demonstration may tread upon the heels of that rule, in which case, the problem will be solved in the most

convenient form. But while he may very likely manage to formulate his own usually successful way of coloring the regions, it is very unlikely that he will obtain an unfailing rule for doing so. For after some of the first mathematicians in Europe had found themselves baffled by the far simpler problem, to prove that every map upon an ordinary sheet can be colored with four colors, one of the very first logico-mathematicians of our age, Mr. Alfred B. Kempe, proposed a proof of it, somewhat, though not exactly, of the kind we are supposing our imaginary inventor to be aiming at. Yet I am informed that many years later a fatal flaw was discovered in Mr. Kempe's proof. I do not remember that I ever knew what the fallacy was. We may assume with confidence, then, that our imaginary interpreter will, at length, come to despair of solving the problem in that way. What way shall I imagine him to try next?

It will be very natural for him to pass from endeavouring to define a uniformly successful rule of procedure, to endeavouring either, first, to define the topical conditions under which two different regions must be colored alike, if the colors are not to exceed a given number; whence he will deduce the conditions under which two regions that do not abut must be colored differently; or else, first to define the conditions under which two regions cannot, by being stretched out, be brought into abuttal along a boundary, and thence to define the conditions under which two regions must be colored alike. Either of these methods is more promising than the one with which he began; and yet were either capable of being perfected without some very peculiar *aperçu*, the easier task of demonstrating that four colors suffice for every map on an ordinary limited sheet or globular surface must long ago have been brought to completion, which never has been accomplished, I believe, in print. We may assume, then, that he will, at length, come to abandon every such method. Meantime, he cannot fail to have noticed several obvious propositions that will be useful in his further inquiries. One of these will be that by minute alterations of the boundaries between regions, which alterations can neither diminish nor increase the number of colors that will in all cases just suffice, he can get rid of all points where four or more regions concur, and thus render the number of points of concurrence two-thirds as many as the number of boundaries, so that the latter number will be divisible by three, and the former by two, unless fewer colors are required than are generally necessary. He will also have remarked that there must for each color be at least one region of that color which abuts upon regions of all the other colors, that for each of these other colors there must be at least one region that besides abutting upon the first region abuts upon regions of all the remaining colors, etc.

I shall suppose that it now occurs to him that it not only makes no difference what the proportionate dimensions either of the whole surface or of any of the regions are, but that it is equally indifferent whether any part of the whole surface be flat, convex, concave, curved, or broken by angles, or whether any

boundaries are straight, curved, or broken by angles, and are convex or concave to either of the regions it bounds; whence it will follow that the problem belongs neither to Metrical, nor to Graphical (or Projective) Geometry, but to Topical Geometry, or Geometrical Topics. This is the most fundamental, and no doubt, in its own nature, much the easiest of the three departments of geometry. For just as metrics, as Cayley showed, is but a special problem in the easier graphics; so quite obviously graphics is a special problem in the easier topics. For there is no other possible way of defining unlimited planes and rays, than by the topical statement (which does not fully define them) that the unbounded planes are a family of surfaces in 3-dimensional space of which any two contain one common line only, which is a *ray*, and of which any three that do not all contain one common ray have one point and only one in common; and further, any two points are both contained in one and in only one ray, while any three points not all in one ray are contained in one and only one unbounded plane.[2]

But though Topics must be the easiest kind of geometry, yet geometers were so accustomed to rely on considerations of measure and of flatness, that when they were deprived of these, they did not know how to handle problems; so that, apart from mere enumerations of forms, such as knots, we are still in possession of only one general theorem of Topics, Listing's census-theorem. Consequently, our imagined investigator, as soon as he remarks that he has a problem in topical geometry before him, will infer that he must utilize that sole known theorem of topics; albeit it is sufficiently obvious that that theorem of itself is not adequate to furnishing a solution of his problem. I will state the census-theorem of Listing with some sacrifice of exactitude to perspicuity, in so far as it applies to the map-coloring problem. The surface which is divided into regions may be bounded by a line or unbounded. If it be unbounded and separates a solid into two parts, I call it *artiad*; if it does not, I call it *perissid*. The *Cyclosy*, or ringiness, of the surface of a body unpierced by any tunnel (i.e., not bridged over by an unbounded bridge) is *zero*; and every tunnel through the body adds *two* to the cyclosy of its surface. The cyclosy of the simplest perissid surface, such as an unbounded plane, is *one*, and every tunnel connecting two parts of it in an additional way (or every cylindrical bridge, which will be a tunnel on the other side of the surface) adds *two* to the cyclosy. A region, or an uninterrupted boundary that

[2] This supposes the unbounded 3-dimensional space to have a peculiar shape. For if it had the simplest shape possible (or what seems to me such, and what Listing assumed to be the real shape of space), every unbounded surface in it would separate it into two parts, and the unbounded line common to two surfaces would cut any third unbounded surface in an even number of points, since this line would pass alternately from one to the other of the two parts into which the first surface had cut the unbounded solid space. The peculiar shape of the solid space is that of "projective space."

does not return into itself (as I will assume is the case with all regions and boundaries between two regions), has *zero* cyclosy. I will further assume that there is more than one region on the surface. Under these circumstances, the census-theorem takes this form, supposing all points of concurrence of regions are points where three regions and no more run together: One third of the number of boundaries from one point of concurrence to the next diminished by the number of regions is equal to one less than the cyclosy of the whole surface, if this be bounded, or to two less than the cyclosy, if the surface be unbounded. In the case of the surface of a body pierced by two tunnels, the surface is unbounded, and its cyclosy is 4. The investigator will see at once that the number of colors must be at least 7, and is likely to be more. For were the body pierced by but one tunnel, let the number of regions each abutting upon all the rest be x. Then, the number of boundaries would be $1/2x\ (x-1)$; and the census-theorem applied to this case would be $1/6x\ (x-1) - x = 2 - 2$. That is, $x^2 - 7x = 0$, or $x = 7$. Since, then, even with but one tunnel seven colors might be required, at least that number will be required for the case of two tunnels. On the other hand, were 2 tunnels made in a projective plane, where the cyclosy would be 5, instead of 4, only 9 regions could touch one another; so that it is likely that for a surface of cyclosy 4, the requisite number of colors is less than 9. The investigator will, therefore, only have to ascertain whether 8, and if so whether 9, colors can be required. He is still not very near his solution, but he is not hopelessly removed from it.

In every case, after some preliminaries, the activity takes the form of experimentation in the inner world; and the conclusion (if it comes to a definite conclusion) is that under given conditions, the interpreter will have formed the habit of acting in a given way, whenever he may desire a given kind of result. The real and living logical conclusion *is* that habit; the verbal formulation merely expresses it.

I do not deny that a concept, proposition, or argument may be a logical interpretant. I only insist that it cannot be the final logical interpretant, for the reason that it is itself a sign of that very kind that has itself a logical interpretant. The habit alone, though it may be a sign in some other way, is not a sign in that way in which the sign of which it is the logical interpretant is a sign. The habit conjoined with the motive and the conditions has the action for its energetic interpretant; but action cannot be a logical interpretant, because it lacks generality. The concept which is a logical interpretant is only imperfectly so. It somewhat partakes of the nature of a verbal definition, and is as inferior to the habit, and much in the same way, as a verbal definition is inferior to the real definition. The deliberately formed, self-analyzing habit, – self-analyzing because formed by the aid of analysis of the exercises that nourished it, – is the living definition, the veritable and final logical interpretant. Consequently, the most perfect account of a concept that words can convey will consist in a description of the habit which that concept is calcu-

lated to produce. But how otherwise can a habit be described than by a description of the kind of action to which it gives rise, with the specification of the conditions and of the motive?

If we now revert to the psychological assumption originally made, we shall see that it is already largely eliminated by the consideration that habit is by no means exclusively a mental fact. Empirically, we find that some plants take habits. The stream of water that wears a bed for itself is forming a habit. Every ditcher so thinks of it. Turning to the rational side of the question, the excellent current definition of habit, due, I suppose, to some physiologist (if I can remember my bye-reading for nearly half a century unglanced at, Brown-Sequard much insisted on it in his book on the spinal cord), says not one word about the mind. Why should it, when habits in themselves are entirely unconscious, though feelings may be symptoms of them, and when consciousness alone, – i.e., feeling, – is the only distinctive attribute of mind?

What further is needed to clear the sign of its mental associations is furnished by generalizations too facile to arrest attention here, since nothing but feeling is exclusively mental. But while I say this, it must not be inferred that I regard consciousness as a mere "epiphenomenon"; though I heartily grant that the hypothesis that it is so has done good service to science. To my apprehension, consciousness may be defined as that congeries of non-relative predicates, varying greatly in quality and in intensity, which are symptomatic of the interaction of the outer world, – the world of those causes that are exceedingly compulsive upon the modes of consciousness, with general disturbance sometimes amounting to shock, and are acted upon only slightly, and only by a special kind of effort, muscular effort, – and of the inner world, apparently derived from the outer, and amenable to direct effort of various kinds with feeble reactions, the interaction of these two worlds chiefly consisting of a direct action of the outer world upon the inner and an indirect action of the inner world upon the outer through the operation of habits. If this be a correct account of consciousness, i.e., of the congeries of feelings, it seems to me that it exercises a real function in self-control, since without it, or at least without that of which it is symptomatic, the resolves and exercises of the inner world could not affect the real determinations and habits of the outer world. I say that these belong to the outer world because they are not mere fantasies but are real agencies.

I have now outlined my own form of pragmatism; but there are other slightly different ways of regarding what is practically the same method of attaining vitally distinct conceptions, from which I should protest from the depths of my soul against being separated. In the first place, there is the pragmatism of James, whose definition differs from mine only in that he does not restrict the "meaning," that is, the ultimate logical interpretant, as I do, to a habit, but allows percepts, that is, complex feelings endowed with compulsiveness, to be such. If he is willing to do this, I do not quite see how he need give any room

at all to habit. But practically, his view and mine must, I think, coincide, except where he allows considerations not at all pragmatic to have weight. Then there is Schiller, who offers no less than seven alternative definitions of pragmatism. The first is that pragmatism is the doctrine that "truths are logical values." At first blush, this seems far too broad; for who, be he pragmatist or absolutist, can fail to prefer truth to fiction? But no doubt what is meant is that the objectivity of truth really consists in the fact that, in the end, every sincere inquirer will be led to embrace it; – and if he be not sincere, the irresistible effect of inquiry in the light of experience will be to make him so. This doctrine appears to me, after one subtraction, to be a corollary of pragmatism. I set it in a strong light in my original presentation of the method. I call my form of it "conditional idealism." That is to say, I hold that truth's independence of individual opinions is due (so far as there is any "truth") to its being the predestined result to which sufficient inquiry *would* ultimately lead. I only object that, as Mr. Schiller himself seems sometimes to say, there is not the smallest scintilla of logical justification for any assertion that a given sort of result will, as a matter of fact, either *always* or *never* come to pass; and consequently we cannot know that there *is* any truth concerning any given question; and this, I believe, agrees with the opinion of Monsieur Henri Poincaré, except that he seems to insist upon the nonexistence of any absolute truth for *all* questions, which is simply to fall into the very same error on the opposite side. But practically, we know that questions do generally get settled in time, when they come to be scientifically investigated; and that is practically and pragmatically enough. Mr. Schiller's second definition is Captain Bunsby's that "the 'truth' of an assertion depends on its application," which seems to me the result of a weak analysis. His third definition is that pragmatism is the doctrine that "the meaning of a rule lies in its application," which would make the "meaning" consist in the energetic interpretant and would ignore the logical interpretant; another feeble analysis. His fourth definition is that pragmatism is the doctrine that "all meaning depends on purpose." I think there is much to be said in favor of this, which would, however, make pragmatists of many thinkers who do not consider themselves as belonging to our school of thought. Their affiliations with us are, however, undeniable. His fifth definition is that pragmatism is the doctrine that "all mental life is purposive." His sixth definition is that pragmatism is "a systematic protest against all ignoring of the purposiveness of actual knowing." Mr. Schiller seems habitually to use the word "actual" in some peculiar sense. His seventh definition is that pragmatism is "a conscious application to epistemology (or logic) of a teleological psychology, which implies, ultimately, a voluntaristic metaphysic." Supposing by "psychology" he means *not* the science so called, but a critical acceptance of a sifted commonsense of mankind regarding mental phenomena, I might subscribe to this. I have myself called pragmatism "critical common-sensism"; but, of course, I did not mean this for a strict definition.

Signor Giovanni Papini goes a step beyond Mr. Schiller in maintaining that pragmatism is indefinable. But that seems to me to be a literary phrase. In the main, I much admire Papini's presentation of the subject.

There are certain questions commonly reckoned as metaphysical, and which certainly are so, if by metaphysics we mean ontology, which as soon as pragmatism is once sincerely accepted, cannot logically resist settlement. These are for example, What is reality? Are necessity and contingency real modes of being? Are the laws of nature real? Can they be assumed to be immutable or are they presumably results of evolution? Is there any real chance, or departure from real law? But on examination, if by metaphysics we mean the broadest positive truths of the psycho-physical universe, – positive in the sense of not being reducible to logical formulae, – then the very fact that these problems can be solved by a logical maxim is proof enough that they do not belong to metaphysics but to "epistemology," – an atrocious translation of *Erkenntnislehre*. When we pass to consider the nature of Time, it seems that pragmatism is of aid, but does not of itself yield a solution. When we go on to the nature of Space, I boldly declare that Newton's view that it is a real entity is alone logically tenable; and that leaves such further questions as Why should Space have three dimensions? quite unanswerable for the present. This, however, is a purely speculative question without much human interest. (It would, of course, be absurd to say that tridimensionality is without practical consequences.) For those metaphysical questions that have such interest, – the question of a future life and especially that of One Incomprehensible but Personal God, not immanent in but creating the universe, – I, for one, heartily admit that a Humanism, that does not pretend to be a science but only an instinct, like a bird's power of flight, but purified by meditation, is the most precious contribution that has been made to philosophy for ages.

Section Two

Memorials and Remembrances of Peirce

IN MEMORIAM CHARLES S. PEIRCE

Francis C. Russell. "In Memoriam Charles S. Peirce. (Born 1839, died 1914.)." *The Monist* 24.3 (July 1914): 469–472.

Concerning genius, its advent discovery and nurture, history informs us that with rare exceptions its worldly case is one of the utmost austerity. On reflection this appears not at all strange.

Pro re nata, genius issues as an outlaw. It breaks over and through the accustomed rules and conceptions to the confusion and perplexity of a world otherwise comfortable in conventions regarded by it as settled possessions. Hence it is unwelcome. Hence the futility of all extant provisions in its favor. Had any Nobel foundation been in existence in 1841, would any of its benefits have found its way to Hermann Grassmann? Not in a thousand years. His case is typical of the general case of genius. Neglect and poverty are its portion in life. Then afterwards lapse of time reveals to a stupid, jealous and oftentimes spiteful world that it has conspired for the suffocation of a divine messenger.

In the late sixties the distinguished Prof. Benjamin Pierce of Harvard, lecturing before the Boston "Radical Club" on "The Impossible in Mathematics," spoke of his son Charles and of his expectations that the latter would develop and fertilize the vistas he had been able only to glimpse. On April 19, 1914, after at least a half century of assiduous probings into the most recondite and the most consequential of all human concerns, in a mountain hut overlooking the serene Delaware, in privation and obscurity, in pain and forsakenness, that son, Charles S. Peirce, left this world and left also a volume of product the eminent value of which will sooner or later be discovered, perhaps only after it has been re-discovered. For his issues have so far anticipated the ordinary scope of even professional intellectual exercise that most of them are still only in manuscript. Publishers want "best sellers." At least they want sellers that will pay the expenses of publication, and buyers of printing that calls for laborious mental application are scarce. Let me here with the utmost solicitude beg all to whom it falls to handle his books and papers to beware how they venture to cast away any script left by him.

Is this panegyric unwarranted? If so, then why should Professor James in his *Varieties of Religious Experience* call Mr. Peirce "our great American philosopher"? Why should Professor Schroeder base his great work "Exact Logic" on the prior work of Mr. Peirce? Why should the editors of the great

Century Dictionary employ Mr. Peirce to write so many of its logical, mathematical and scientific definitions? Why should the editors of Baldwin's Dictionary make a similar draft? Why should the editors of the *New York Evening Post* and of *The Nation* for years refer their books of serious import to Mr. Peirce for examination and review? Why should Dr. Carus recognize in Mr. Peirce a foeman worthy of his incisive steel on the fundamental problem of necessity?

Of course genius is unconformable. "'T is its nature to." It is often very hard to get along with. It tries the patience to the limit. It is so immersed in and so saturated with the inspiration of non-conformity that it often neglects to observe what is really and plainly only a merely defensive right on the part of the world of conformity. There ought to prevail a mutual spirit of forgiveness. If much is to be forgiven because of much love why should not much be forgiven to much promising and well directed power?

Mr. Peirce died a faithful man. His earlier studies led him far towards the goal of materialism, but in the course of those studies he was led to the discovery of that touchstone of values, that at first until the conception and word became mangled and aborted out of its true intent and utility he called Pragmatism, the principle that all rational significance of conceptions and of the terms embodying the same lies between the four corners of their *conceived* consequences in and to actual practice mental and otherwise. Since all logic is only a comparison and criticism of conceptions, this principle affects and effects our whole rational life and conduct. He was thus led to his conception of *reality* as that which has the natural prerogative of persistence as a possession forever. He perceived that intellectual entities, like, say, the law of gravitation or the ratio of the radius to the circumference of a circle, have just as abiding a persistence as any material entity and hence just as *real* an obtaining. Hence actual medieval realism, when better introduced and explained, is more pragmatically valuable than any case of nominalism or conceptualism can possibly be. The recognition of ideal realities opens out into the recognition that all existence is grounded in and upon that ideal substance the best names for which are *Form*, alias *Reason*, alias *Mind*, alias *Truth*, alias *the Good*, alias *Beauty*. The perception of Reason immanently in and throughout the universe and identical in nature with human reason solves at once the vexed question of the relation of body and mind, invites the soul to faith and repose and at the same time stimulates the soul to a vivid aspiration after cooperation with the Universal Spirit in accordance with its course of procession.

So lives Charles S. Peirce. The Universal Spirit has him and the world that neglected him will care for him – after many days perhaps, but most assuredly.

CHARLES PEIRCE AT JOHNS HOPKINS

Ellery W. Davis. "Charles Peirce at Johns Hopkins." *Mid-West Quarterly* 2.1 (October 1914): 48–56.

In the company of scholars and investigators which Daniel Coit Gilman gathered at Baltimore in the seventies and eighties was Charles S. S. Peirce, son of the Harvard mathematician, Benjamin Peirce, and considered by Sylvester (surely a capable judge) "a far greater mathematician than his father." But great though his mathematical powers were, it is not they alone which chiefly distinguished him among the scientists of his generation. Mathematics was simply one of the many fields of thought tilled by his active brain. At Harvard it was in chemistry that he had chiefly distinguished himself, but it might as well have been in physics. While lecturing at the Johns Hopkins, he was also conducting experiments for the U.S. Coast Survey. But it is perhaps for his researches in symbolic logic that he is chiefly known, being, indeed, the inventor of the logic of relatives, since developed by Russell into the logic of relations. He himself considered more important his theory of inductive reasoning; which certainly is more understandable and usable, for the logic of relatives is the acme of technicality and abstraction. As an indication of the power of this logic, let it suffice to say that in terms of it all of the two hundred and sixteen varieties of algebra classified by his father can be expressed, among which ordinary algebra, the algebra of imaginaries, and quaternions are special cases. Further, any algebra whatever can be brought under the domain of this system.

As for his theory of induction it is presented in a series of six articles in the *Popular Science Monthly* for 1878, though there is a briefer, but more technical exposition, in the *Johns Hopkins Studies in Logic*; while Baldwin's *Dictionary of Philosophy and Psychology* contains a number of Peirce's contributions bearing upon his theory. His lectures in advanced logic, delivered at Baltimore the second semester of 1880–1881, were wholly devoted to an examination of the logical foundations of the leading scientific theories of the time. They were based on his theory of induction, the gist of which is that induction is a safe process because it is a self-corrective one. Truth in science, as truth everywhere, is that conclusion concerning any matter toward which tend, in the long run, the opinions of competent investigators. If science lead us astray, more science will set us right. But at

any given time may not common sense be right and science wrong? In matters where the judgment of common sense is based on intimate experience this may certainly be the case, even though those who pass the judgment cannot always give an account of the manner in which they have arrived at it. Those judgments that are the result of race-experience most of us would be unable to distinguish from intuitions. We believe in them, but cannot tell how we have come to believe in them. Yet if they relate to matters of constant experience they may be trusted. For constant experience, by trial and error and correction, even though these be half unconscious, leads to true ideas. Even the lower animals have such ideas. The human animal, however, not infrequently holds to ideas that are altogether false. When this is so, it will in most cases be found: (1) that there has been no experience; or (2) that the experience has occurred under conditions that have ceased to exist; or (3) that in some other way the experience was not typical but unique and peculiar. It is conceivable that one might be led to have very strong convictions about the politics of the inhabitants of Mars; but neither the strength of one's convictions, nor the fact that he had got a number of people to agree with him, nor even that he had founded a society perpetuating his ideas from generation to generation would give the least validity to any conclusions reached by his possibly intensely interesting speculations. The probability that one shall be right in a matter concerning which he knows nothing and has no experience – direct, indirect, or remote – is zero. A blindfolded marksman cannot be expected to hit the bull's-eye.

With most of us true ideas and false are mingled in inextricable confusion. Is there a way in which they may be disentangled? Pascal seemed to think that clearness is the touchstone of truth, – as it certainly is a help. One service of Peirce is that by his maxim of pragmatism he has shown us how to clarify our ideas somewhat. This maxim, as stated in the *Popular Science Monthly* for January, 1878, is as follows: "Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have. Then our conception of these effects is the whole of our conception of the object." How completely this criterion brushes aside such speculations as those concerning Martian politics! How many interminable discussions are cut short by its application! Two men are hotly contending as to whether the first life on earth is due to spontaneous generation or to special creation; they apply to a third to decide between them. "Tell me," he says to them, "just what your spontaneous generation is; that is, how I am to know it, supposing a case to occur before me; and tell me also just how I am to distinguish a special creation. Of course, if the phenomena are all the same, there is really nothing to dispute about." To be sure, the pragmatic maxim, like many another, can be misapplied; in the opinion of its author, it has been misapplied. In fact, he later admitted that his own statement had been inadequate, that, besides immediate practical

consequences, one should have in view consequences in the long run, fitting into a general reasonable view of the universe.

A belief is a habit of thought formed, as are all habits, mainly by repetition. To say that the belief is based on experience, is merely to say that the occasions calling for the exercise of the correct habit have been sufficiently numerous to lead to its formation. To draw conclusions under the dominance of a belief is strictly analogous, likewise, to action in accordance with habit. Deduction is the correlative of willing; induction, of habit-learning; reasoning by analogy or hypothesis is the correlative of feeling. If a habit be strong, then, given the compelling circumstances, the resulting action can be predicted. We say of a man that he *always* acts in such or such a way. If his habit be less strong, he may still be *liable* to act in the characteristic way; and we may perhaps say that the chances are three to one that he will. But knowing that there were certain circumstances tending to form a habit, we should find it very difficult, wellnigh impossible, to tell how strong a habit a man placed in those circumstances would form. Still one could safely wager that, taken as they come, men would be unlikely to form habits leading to disastrous results in the given circumstances. In the long run, most of them would certainly learn better; a belief that mankind can walk on water would not be likely to spring up among sailors.

Again, knowing that under certain circumstances a friend acts in a certain way, can we from the action assume the circumstances? Can we calculate the probability that these circumstances, rather than some other circumstances, are the cause of the action? Does the fact that this friend carries a valise tell us whether he is going to a train or coming from it? When one feels that he is singing correctly, is he really singing correctly? Is feeling that we know anything, more than knowing that we feel? Were those who let Sully escape at the massacre of St. Bartholomew justified in assuming that he who carried a missal was a Catholic? Can we in any of these cases calculate the numerical probability of the conclusion? This point is worth dwelling upon; for it may enable us to see why Peirce, though trained as a mathematician, was not misled by that school of mathematicians, with Laplace at the head, who pretended to calculate the probability of an induction; as though, forsooth, one could put a lot of universes in a hat and wager seven to three, say, that our sort of universe would be drawn out. Does this look absurd? Well, Laplace calculated that the odds against the then received mass of Jupiter being in error by two per cent. was 999,308 to 1. The perturbations of Juno proved, nevertheless, that it was two per cent. in error. Neither did Peirce assume, as did Mill, any such principle as the "uniformity of nature," but merely that, in observing a series of events we were more likely, in the long run, to observe what did characterize the series than what did not.

Peirce 's lectures were illustrated, as has been intimated, by important theories from the principal sciences. At the very beginning it was necessary

to emphasize the distinction between mathematics and the other sciences, though these others may, at least in certain of their branches, tend to become mathematical. It is true, as Sylvester pointed out in his controversy with Huxley, that mathematicians use induction; but that does not make of mathematics an inductive science. The final proofs, and no true mathematician rests content until he gets these, – the final proofs are always deductive. This is one characteristic of mathematical reasoning; but another, quite as obvious, is the intricacy of the reasoning. Whatever the subject matter may be, – number, space, time, force, groups, relations of any sort, – if the final proofs are obtained by intricate deductive reasoning, then we are thinking mathematically. In the *Century Dictionary*, to which he was an extensive contributor, Peirce defined mathematics as "the study of ideal constructions (often applicable to real objects) and the discovery thereby of relations between the parts of these constructions before unknown." This conception supplements the earlier idea, as indeed it was supplemented in his lectures, by pointing out that by deduction, as well as by induction, one is led to discover truths before unknown. For that matter it is hardly likely that any considerable part of mathematics could ever have been developed except by the help of deduction; by this process the mathematician has been led into ideal fields that had else remained wholly unexplored; reason has transcended imagination. Cantor would even replace the terms *pure* and *applied* mathematics by the terms *free* and *constrained* mathematics. The physical sciences may become, and have become in some degree, mathematical; but free they cannot become and yet remain physical. The service of mathematics in these sciences is that one is enabled by it to make long-range predictions; when these predictions are found, by observation and experiment, to be in consonance with the facts, then there is reason to believe that a consistent, well-ordered theory is growing up. The discovery of a Uranus verified not only the prediction thereof, but also them previous observations and the reasoning based on these observations which led to the prediction; it verified the scientific method of astronomy. Similarly the discovery of Galium was a verification of Mendelieff's law and of the science of chemistry; while the discovery of the Hertzian waves rendered a like service to physics. Thus, there is need for the verification of mathematical deductions. Without this verification, they are dangerous conclusions; and the farther the deductions are carried, the greater the danger. It is precisely the most far-reaching speculations of science, those that get farthest away from observed facts, that must be suspected. It is a characteristic of many theories, for example, the wave-theory of light, that while up to a certain point they triumphantly explain the facts, yet, as one pushes the theory farther and farther, a realm is reached that is mainly a realm of conjecture. Hence the need for crucial for experiments.

The matter was neatly illustrated one evening by Peirce before the Johns Hopkins Scientific Society. He reviewed Priestley's investigation concerning

atomic weights and specific heats. On comparing the specific heats and the atomic weights of each of the monad elements, Priestley found that he could write a formula expressing each specific heat in terms of the corresponding atomic weight. This is easy; any small set of numbers can thus be a paired off with another small set. But when Priestley tried his formula upon the dyad elements, it did not work. He found, however, that by a modification he could get a formula to hold for both monads and dyads. This formula did not hold, however, for the triads. So there was another modification, and after that still another. When in this way he got a formula holding, say, for half the elements, would there be any probability of its holding for the others? If not, why not? The method taken to show the fallacy of the assumption of such a probability was to assign the specific heats at random among the elements and then show that Priestley's method would work just as well as ever. Priestley's predictions had uniformly failed; thus no confidence could be placed in his final prediction. Again, of all the conics that pass through four points, only one, in general, passes through an arbitrary fifth point. But when an astronomer calculates an orbit from a few observations, and then finds that the planet is always to be found following that orbit with reasonable approximation, his computation and the underlying theory are alike verified. Why is not this an exact verification? In brief, because observations are not exact, neither those used for the basis of calculation nor those used to test the motion of the planet in the orbit. Nor are we exactly given all the forces acting upon the planet; some of them may be both unknown and unsuspected. Our observations are discordant and have to be reduced and smoothed by methods based on the theory of chance. Law, if law there be in these variations, has not manifested itself, and to us it is as though non-existent. But a study of the conception chance has in the very negation of law revealed a reign of law. Laws of chance, however, are never exactly kept, else would they cease to be laws of chance and freedom would succumb to habit.

May not the laws of the universe be the acquired habits of the universe? May there not still be a possibility of the modification of these habits? May there not be the possibility, forever, of the formation of new habits, new laws? May not law be evolved from a primordial chaos, a universe of chance? In the play of chance still apparent may we not see the continual renewal of the life of the universe, a continual renewal of the capacity for habit-forming and growth? Tracing the evolution backwards we are led to the conception of absolute chance. This is of course a limiting conception; and we need not assume its actual existence, for there are countless ways in which a limit may be forever approached and yet never reached. It is not wise, certainly it is not pragmatic wisdom, to go too far from facts. But does not the universe now behave as if in transition from less of law to more? Does it not behave as if there were a never failing source of new life, new energy, which is to be, in turn, brought under the reign of law? There is a certain likeness, in all this,

to the "creative evolution" of Bergson, though to me it seems a clearer and more definite conception than Bergson's, and one more in touch with science, more in harmony with experience and observation. For it does not require us to reject the supremacy of intellect and reason; certainly it would not use the triumphs of science as an argument against science, or say that science is successful because of its limitations, because blind to everything except the grossly material. Surely it is sufficient to admit, as does Peirce, that many matters, and vitally important matters, have not as yet been brought under the domain of reason; to admit that many matters never can be reduced to reason; and again to admit that action is demanded and always will be demanded, in matters irrational. This is merely saying that where we have not knowledge, we are compelled to go ahead as well as we can without it. Who shall set bounds to observation, to experiment, to the reasoning, inductive and deductive, based thereon? Surely, there is an infinite possibility for the formation and development of ever new bodies of knowledge – that is, new sciences. The conception of the universe in transition but increases this possibility; even the laws of the universe are evolving and so have themselves laws of evolution. In the words of Peirce, "in spite of the general shipwreck of ideas, the flotilla of knowledge is constantly increasing."

It would require great technicality to present any large number of Peirce's criticisms of scientific theory, but I will indicate a few of these. Mechanics expresses all motion and force in terms of five units, three of space, one of time, one of mass. What are the masses of bodies? Numbers which we attach to them in order that our equations of motion may be satisfied. Can there be action at a distance? That is, can a body act where it is not? What do we mean by the presence of a body except that it has certain effects, exerts a certain force? The table is *there*, because, when we press there, it presses back. Very well; if repulsive forces prove the existence of a body, so do attractive: that is how Uranus was discovered. If, then, a body is where it acts and the law of gravitation is true, each and every body exists throughout the universe, and action at a distance is not action where a body is not, but merely where its attraction prevails over its repulsion. The boundary of a body is the place where vanish certain differential coefficients. The reasoning by which chemists were in the first instance led to the atomic theory was very bad. The law of simple proportions was not helped by the conception of atoms. The chemists did not then, or for a long while after, give a reason why atoms should not combine in very complicated proportions, say 3,872 atoms of hydrogen to 11,916 of oxygen. The real proof of the existence of molecules and atoms was furnished by physics in connection with one of its great triumphs, the kinetic theory of gases. The triumph of chemistry was Mendelieff's law. The establishment of this law was remarkable because it is difficult either to establish or disestablish laws of periodicity; waves so melt into waves. For example, it has so far baffled observers, whether there may not be some connection

between lunar movements and earthly weather. The progress of chemistry will lie in the explanation of valency, which includes why elements combine in simple proportions. Many of the recondite phenomena of physics, chemistry, and especially biology may be explained by supposing the atoms composed of atomicules. To-day we should substitute "ions" for Peirce's "atomicules"; but his idea was prophetic. One of his most striking lectures had to do with the application of this conception to the phenomena of growth and reproduction. As to whether biologic phenomena can be explained mechanically, he remarked that the processes to which the conservation of energy is applicable are reversible, but life is an irreversible process. He held, further, that without catastrophes from time to time the accumulation of minute chance variations by the survival of the fittest was insufficient for the development of a new species. His reason was that chance variations, in accordance with Bernoulli's law, would always preserve the dominance of the original type. He admitted that, assuming (in accordance with his philosophy) the habit-acquiring property in the universe, the development of a new species by minute variations is possible; but he insisted that the biologists had never called attention to this fact. Remember that this was thirty years ago.

In such theories as the scientists were then developing, Peirce saw the germ of the philosophy of the future, the foundations of an edifice yet to be erected. The attempts of the Germans to erect a philosophic edifice in the air, without such foundations, merely caused him to smile. Had not the German philosophers proven each other false? Why give them ear? Kant, instead of asking how are synthetic judgments *a priori* possible, should have asked the simpler and more profitable question, how are synthetic judgments possible. Perhaps he had then been led to a correct theory of induction. As for a *Ding an sich*, it could be only a thing out of relation—that is, out of existence. Mill's *Logic* he characterized as a great philosophic work, embodying the philosophy of ordinary mankind. But Mill did not know what was important in science. To such a degree was this true that most of the instances of scientific induction which he gave, in the first edition of his book, afterwards turned out to be bad inductions. Mill should have concluded from this fact that there was something wrong with his theory. Moreover, though on first reading seemingly clear, Mill is really not so; study of his work brings out ambiguities and contradictions. During the beginning of one's study of logic, we were told – that is, during the first ten years – one should devote oneself entirely to learning the exact meaning of words. Mill had neglected this.

Perhaps I have, in some measure, reproduced the atmosphere of Peirce's Hopkins lectures. To complete the conception of the man, it would be necessary to exhibit him in his talks before the Logic Club, necessary to speak of his papers in the old *Journal of Speculative Philosophy* and in the *Monist*, besides more technical papers elsewhere. But this would require profound and long-continued study. I may say merely that the deeper one

enters into the spirit of Peirce's teachings the more logically and philosophically satisfying, the more complete and harmonious and inclusive they seem to be.

PEIRCE AS A PHILOSOPHER

Josiah Royce and Fergus Kernan. "Peirce as a Philosopher." *Journal of Philosophy, Psychology and Scientific Methods* 13.26 (21 December 1916): 701–709.

Charles S. Peirce called himself, in his later years, simply a logician. That he was a philosopher he fully recognized. But the term logician seemed to him more apt for a person engaged in the researches to which he was most devoted. For Peirce, rightly, logic would constitute the best possible foundation for a sound philosophy. But most philosophers, as he very correctly saw, were not logicians and would not be likely to become such until some very great reform occurred. Peirce united very wide knowledge of the history of philosophy with a generally fair-minded disposition to a discriminating criticism of philosophers, and with a capricious, though generally very well restrained interest in philosophical polemic, whose arts he regarded with a general skepticism and pursued with a usual moderation. But all the more he felt that the name logician stood rather for what the philosopher ought to be than the name philosopher for what a well-trained logician was most likely to be. So it was as logician that he wanted to be judged.

Nevertheless he was a philosopher. Like a good many other recent philosophers, he desired his philosophy to be what is so often called scientific. He desired that the methods of the various natural sciences, and in particular of the most exact natural sciences, such as physics and chemistry, should be the models of his philosophical speculations. He had a better right to use the term scientific philosopher than is customarily the possession of those who use this term. His early training here in Cambridge, in his father's house and in the Lawrence Scientific School, was, first, in mathematics (since his father, Professor Benjamin Peirce, the elder, was one of the greatest American mathematicians). Peirce was fond of saying that he grew up in a laboratory. Later, he did some good work in the observatory. Still later, he was busy with the conduct of a good many statistical researches in connection with the Coast Survey. He was early and long familiar with exact measurement, and with the theory and practice of the determination of the errors of measurement in the measuring sciences. So, when he spoke of being a scientifie philosopher, he was not without a really close knowledge of what scientific method in philosophy ought to mean. That in addition he did not fail to appreciate some at least of the great historical thinkers was due to his wide, manifold, and in

some respects, very thorough erudition – an erudition that remained, like many other of his personal possessions, somewhat capricious, despite its frequent thoroughness. At any rate, whether he worked in any one of his publications rather as logician or as general philosopher, Peirce had no interest in founding a school, belonged to none of the existing schools, had a wide range of appreciation for other minds, and a very great disposition to bind inductive methods with speculative interests.

That Peirce should be classed amongst the evolutionists is, for many reasons, natural. His early education was finished, and his maturer scientific work begun, in the great decades of the modern evolutionary movement. His principal contribution to fundamental logical theory, that is, his own highly technical definition of the three categories or modes of being,[1] which he made fundamental in all his speculations, was published in the year 1867 in the "Proceedings of the American Academy of Arts and Sciences in Boston." His essays on scientific method in the *Popular Science Monthly* were printed in the early seventies, – I believe from 1873 to 1876. "The Studies in Logic," by the members of the Johns Hopkins University, a book composed partly by himself and partly by his advanced students in logic at Baltimore, was published in the early eighties. Thus, his work brings him into close contact with the formative period of the modern doctrine of evolution.

But Peirce was never a follower of Spencer, whose relation to natural science was not such as seemed satisfactory to a mind of Peirce's type and training. Nor was Peirce very prominently influenced by Darwin, although, of course, he knew Darwin well. For Peirce was, once for all, a man rather of physical and chemical training and of practice in the use of various instruments of precision, than a man at all carefully trained in the biological sciences. His interest in human nature was wide and varied, and, in his fragmentary way, he contributed notably to the study of various psychological problems – in particular, to problems relating to the threshold of sensation, and to various other problems of the psychology of perception.

The "evolution" of Peirce was therefore no variation of the evolutionary philosophy of Spencer or of Spencer's disciple, Fiske. Such minds left him uninterested. History, and especially the history of thought, and in particular of the various natural sciences, interested Peirce deeply. But his mind, when he thought of evolution, turned its attention to the matters which most fascinated him as a logician. He wanted to know not merely about the evolution of any one group of physical phenomena, whether stellar or terrestrial, whether organic or inorganic. He wanted to know about how the laws of nature came to be what they now are. For him the doctrine of evolution was

[1] (1) Things, that is, individuals; (2) objects of conception, that is, universals; and (3) signs. Peirce often mentioned, in conversation, these "three sorts of being" as the essential feature of his philosophy.

to be, if it should succeed at all, a doctrine of the evolution of the laws of nature, a doctrine regarding how the world came to acquire not the plants, nor the animals, nor the solar systems, nor the Milky Way, that now it has, but how the laws of nature came to be what they are at all.

Peirce's speculations upon these topics were very highly original, were continued over a period of very many years, were perhaps the most characteristic productions of his whole personal character and mental interest which, apart from his technical logical researches, we possess. These speculations very greatly interested William James and played their part in the formulation of that whole "philosophy of change" on which William James's latest interests were most centered. Yet to James the principal illustrations of this doctrine of the evolution of natural law always remained unfamiliar and somewhat too technical, so that James listened, in company in which I was sometimes privileged to be present – listened, I say, to these aspects of Peirce's philosophy with an interest which certainly did not follow Peirce's thought into precisely those regions which Peirce himself most valued. The ideas here in question are so manifold and complex that I can not hope to give you any adequate idea of them. Let me simply indicate a few of them.

Most philosophers, if they concern themselves with the laws of nature at all, begin by regarding certain fairly simple laws, as, so to speak, the only examples of canonical and legitimate sorts of natural law that we ought to recognize. Mechanical laws or exactly quantitative laws or formulas capable of precise natural formulation, these such philosophers regard as the reasonable sorts of law. In case a man does not believe that these types of law are universal, are pervasive, or are canonical, his philosophy is usually likely to be some sort of teleology, or some doctrine that freedom, or that spiritual significance rules the world, and that exact law is subordinate to more or less sentimentally conceived ideals.

But Peirce's philosophy was dominated by quite other modes of thinking whose origin lay partly in his experience in dealing with the problem offered by the efforts of science to eliminate or to reduce to rule the errors which are encountered in the actual measurements which the physical sciences endeavor to make. Partly his ideas on these subjects were due to still more general logical considerations which influenced him greatly from the time they first met his notice. The laws of nature that we actually confirm – so Peirce was accustomed to say – are laws which, so far as we can verify them, are *approximately* true. All measurements are inexact, and have to be corrected by further measurements. The moon which astronomers observe, especially if the observations extend over many centuries, as, by the study of the records of ancient eclipses we can make them extend – the moon of observation – never agrees precisely with the ideal moon which the astronomical theory demands. Of course as astronomical knowledge grows toward perfection, the discrepancy between theory and fact grows less. That is simply because the better we know

nature, the more we can discover how to adjust theory and fact, one to the other. But if we extend our survey of nature from the instant to the year, from the year to the century, from the century to the geological period, or to the evolution of a stellar system, we get evidence that natural laws which hold with appreciable exactness and within the errors of probable observation, during short periods of time, no longer hold with such precision for very long periods of time. There is a reasonable inductive evidence that the laws which nature follows are themselves only approximately true and are subject to evolution, so that Newton's law of gravitation is presumably very nearly true at the present time for the present moon and planets, for the present stellar systems. But it is equally probable that this law is even now only a close approximation, not an absolutely necessary order of things. For similar inductive reasons, it becomes probable that, in so far as Newton's law of gravitation now holds true, it did not always hold true, and that this, like all other laws of nature, is a product of evolution.

What an inductive study of nature makes probable, Peirce was accustomed to regard as what the rightly trained mind of the logical student of nature would regard as that which would be likely to be characteristic of a nature in which evolution has taken place. For Peirce rejected, upon logical grounds, the doctrine that the natural world or any other portion of the universe known to us, must necessarily be subject to any *a priori* laws, except the purely logical ones, or to a perfectly exact law of causation. Regularity, as Peirce was especially fond of saying, is not necessarily a self-evident type of any real world which is known to us. Regularity, where it exists and in so far as it exists, is precisely that aspect of the world *which most stands in need of explanation*. If you find a pack of cards lying in confusion, you suppose that to be the natural result of their having been thrown down in a chance way by somebody whose dealings with them were governed by no necessary, rigid, or precise law. That is, the chance disorder of the pack of cards thrown down at random needs, on the whole, no explanation. But if you find the cards in some precise order, as, for instance, in the order required by a certain hand in a certain game, then you stand in the presence of a fact which needs explanation. You very properly and logically ask why they came to be in this order.

Precisely so the relatively chance order of the starry heavens in the region of the Milky Way calls for no scientific explanation. But if the planets conform to Kepler's laws, if the moon of astronomical theory approximately agrees with the moon of observation, it is, logically speaking, a fair question to ask why the planets and the moon behave thus, or, in evolutionary terms, how they came to do so.

Precisely so Newton's laws of motion, in so far as they are approximately true of the physical world, demand an explanation and an evolutionary explanation. If such can be hypothetically furnished, we thereby come to see

why and how the Newtonian natural laws have come to characterize the real world.

Thus every sort of natural law, precisely in so far as it is approximately exact law, logically demands, if possible, an explanation in terms of the theory of the evolution of natural law. And, empirically speaking, as Peirce was never weary of insisting, there is a wide range of empirical evidence that the present laws of nature are the products of an evolutionary process. In this thought consisted the evolutionary theory of Peirce. A brief mention now of some of his other leading ideas must close this essay on his philosophy.

The second of Peirce's leading ideas dominated his highly remarkable and original version of inductive logic. I have sometimes ventured to call this doctrine by a name which Peirce himself, in some of his early papers, suggests by his illustrations, though I believe that he had never formally used it. This name is the "Insurance Theory of Induction." I have no time to expound it here. It was originally set forth in the series of articles in the *Popular Science Monthly* entitled "Illustrations of the Logic of Science."

The third leading idea of Peirce's philosophy to which I wish to direct attention results from his theory of the evolution of natural law, and expresses the result of his most synthetic survey of cosmological problems. This is the theory according to which chance is objective, and the whole universe expresses a process that has two extremes, with chance as a limit towards one end and rigid necessity as a limit at the other end of an endless temporal process.

The fourth of Peirce's leading ideas relates to the teleological and mental aspect of the world, that is, to the idealistic tendency which formed a motive in Peirce's thought, but which never became amplified in a dogmatic idealistic metaphysics. This idea had a certain similitude to ideas which Bergson has recently made interesting, though there is never very close agreement between Peirce's ideas and those of Bergson. But Peirce has his own theory as to the part which intuition plays in the work of the human mind and in the guidance of scientific research. Peirce's thoughts on this subject are fragmentary. Indeed his entire life work may in a certain sense be called fragmentary. Yet it is my belief that his ideas will amply repay study. As he himself says in the conclusion to that brilliant essay, "The Architecture of Theories," – "may some future student go over this ground again and have the leisure to give his results to the world."

The Peirce Manuscripts

All the remaining papers of Peirce have now been placed under the joint care of the Harvard department of philosophy and of the Harvard library. The papers are in many ways fragmentary, but may be regarded with confidence as containing some very important things. We have also in our possession

copies of his various published essays, which are also somewhat fragmentary and which in their original publications were pretty widely distributed in various journals and learned transactions. A word about these seems in order before passing on to a description of Peirce's unpublished papers and manuscripts.

Of Peirce's published works the most important from a purely scientific standpoint was a photometric research upon a group of stars selected for that purpose by Professor Pickering, the results of this research being still valuable, despite the changes in modern methods which have taken place in the field.

Another contribution of Peirce's to the world's storehouse of scientific knowledge is none the less valuable because it is generally unknown. I refer to the scientific vocabulary of the first edition of the Century Dictionary, of which Peirce was the author in so far as that portion of the Century Dictionary had any one author at all. Peirce's vast erudition in the history of science and particularly his familiarity with scholastic philosophy to which he was long devoted made his work as a dictionary-maker exceedingly valuable.

Nearer to philosophy one comes perhaps when one speaks of Peirce's researches on the algebra of logic and in particular in the logic of relatives. Many of the most recent researches, including those of Bertrand Russell, are still due to his influence, although Russell, as I think, has a somewhat inadequate sense of his own generally indirect indebtedness to Peirce's work in this field. The logical essays of Peirce which deal with synthetic logic and with the logic of relatives were collected and brought into a sort of a synthesis by Schroeder. A list of them can be found in Schroeder's *Algebra der Logic* (Appendix to Vol. 1).

Distinct from these researches in exact and, in general, in deductive logic are Peirce's manifold contributions to the logic of induction. The most important essays of Peirce in this field appeared in the early seventies of the last century in the *Popular Science Monthly* under the general heading of "Illustrations of the Logic of Science." Of the researches of Peirce on this subject, I do not hesitate to say that they are still very imperfectly appreciated and are of enormous importance.

As is well known, William James considered Peirce as the father of pragmatism. Yet what little Peirce published on this subject will go to bear out the remark that there is little in common between his pragmatism and that of James. Peirce's *Monist* article entitled "The Issues of Pragmaticism" was written for the express purpose of maintaining the independence of his thought from either the pragmatism of James or the humanism of Schiller. The word practicism seemed to him best to describe the philosophy of these two thinkers. As for Peirce himself, when he saw his pragmatism threatened with too much popularity he found it easy to take refuge in a new word, namely, "pragmaticism" which, as he liked to say, "seems ugly enough to escape the kidnappers."

It is not always easy to understand Peirce. He never regretted the fact that most people found it hard to follow his ideas. He deliberately chose that most of his researches should be concerned with highly technical topics and should be secure from the intrusion of the uncalled. Upon occasion he could be brilliantly clear in his expressions of highly complex and recondite problems, although this clearness was a capricious fact in his life and in his writings, and was frequently interrupted by a mode of expression which often seemed to me to be due to the fear, after all, that in case mediocre minds found themselves understanding too many of his ideas, they would be led to form too high an impression of their own powers. One finds this tendency towards what might be called "impenetrability" especially evident in his manuscripts. Too often the reader meets with a thought of surpassing brilliancy and follows it eagerly, only to have it disappear like the cuttlefish in an inky blackness of its own secretion.

The most complete manuscripts of the Peirce collection include copies of the "Lectures on Pragmatism" which were delivered privately to a circle of friends in Cambridge and of the Lowell Lectures on Logic of 1903–4. It was these latter which James described as "flashes of brilliant light relieved against Cimmerian darkness" – "darkness" indeed to James as to many others must have seemed those portions on "Existential Graphs" or "Abduction." Yet it seems strange that the very striking lectures on "Induction," "Probability," "Chance," and "Multitude" should have attracted nothing more than a passing notice.

The two works, which, if they could ever have been completed, were intended by Peirce to be the proper fruits of his studies, were a "History of Science" and a "Comprehensive Treatise on Logic." Both of these remain unfinished; and the value of his fragmentary manuscripts will largely depend upon the extent to which future editorial work can bring into unity the very considerable fragments which his remains contain of the studies which were intended to form part of these works. So far as his erudition and inventiveness were conditions for the writing of these two intended books, Peirce possessed both these characters most abundantly. No greater mind has ever appeared in America in respect of the powers needed for the writing of these two projected works. No more ample erudition has ever existed amongst us regarding the topics which were here in question.

Of especial importance from an historical standpoint are the writings of Peirce which deal with Aristotle and with the scholastic philosophy. Aristotle, Peirce read in the original carefully and for many years, and his manuscripts contained many original expressions of his independent opinion about the problems connected with the interpretation of the Aristotelian philosophy. For the scholastic philosophy Peirce always had a very great interest. Duns Scotus was among his favorites, both as logician and as metaphysician. He was not attracted to the Scholastics by any of their theological relations, but by an

interest in their skilfully devised vocabulary, and in the beautiful array of their word conceptions. A treatise which I recently found among his manuscripts entitled "Duns Scotus and Occam" sets forth very clearly the issues of realism and nominalism in the light of modern thought and goes far towards showing that many contemporary philosophers, as, for instance, Bertrand Russell, are not so far away from scholasticism as the calendar might indicate.

The following constitutes a list of the titles of the more important among the Peirce manuscripts. It is far from being complete, yet it may serve to suggest the varied and in many respects original nature of Peirce's philosophical and scientific researches.

" On Retroduction, Induction, and Abduction." " Minute Logic." "Treatise in Logic": Chapter I, "Prelogical Ideas"; Chapter IV, "Ethics"; Chapter VI, "The Three Kinds of Signs"; Chapter VII, "The Aristotelian Syllogistic"; Chapter VIII, "The Algebra of the Copula"; Chapter XI, "On Logical Breadth and Depth"; Chapter XIII, "Simplification of Dual Relatives"; Chapter XIV, "Quantification of the Predicate"; Chapter XV, "Existential Graphs." "Synechism." "Lectures on the British Logicians." "Positivism." "Aristotle on Categories." "Molecules and Molecular Theory." " Prospect of Air Sailing." "On Representation." "On small Differences in Sensation." "Notes on Royce's World and Individual." "Illustrations of Dynamics." "Theory of Numbers." "Refutation of Transcendentalism." "*A Priori* and *A Posteriori.*" "The Seven Systems of Metaphysics." "Quantity and Quality." "On Multitude and Number." "Logic of History." "Lectures on Kant." "On Mind and Matter." "Logic of Continuity." "On the Associations of Ideas." "Spinoza." "Hume – a Critical History of Logical Ideas."

THE PRAGMATISM OF PEIRCE

John Dewey. "The Pragmatism of Peirce." *Journal of Philosophy, Psychology and Scientific Methods* 13.26 (21 December 1916): 709–715.

The term pragmatism was introduced into literature in the opening sentences of Professor James's California Union address in 1898. The sentences run as follows: "The principle of pragmatism, as we may call it, may be expressed in a variety of ways, all of them very simple. In the *Popular Science Monthly* for January, 1878, Mr. Charles S. Peirce introduces it as follows:" etc. The readers who have turned to the volume referred to have not, however, found the word there. From other sources we know that the name as well as the idea was furnished by Mr. Peirce. The latter has told us that both the word and the idea were suggested to him by a reading of Kant, the idea by the *Critique of Pure Reason*, the term by the *Critique of Practical Reason*.[1] The article in the *Monist* gives such a good statement of both the idea and the reason for selecting the term that it may be quoted in extenso. Peirce sets out by saying that with men who work in laboratories, the habit of mind is molded by experimental work much more than they are themselves aware. "Whatever statement you may make to him, he [the experimentalist] will either understand as meaning that if a given prescription for an experiment ever can be and ever is carried out in act, an experience of a given description will result, or else he will see no sense at all in what you say." Having himself the experimental mind and being interested in methods of thinking, "he framed the theory that a *conception*, that is, the rational purport of a word or other expression, lies exclusively in its bearing upon the conduct of life; so that, since obviously nothing that might not result from experiment can have any direct bearing upon conduct, if one can define accurately all the conceivable experimental phenomena which the affirmation or denial of a concept could imply, one will have therein a complete definition of the concept, and *there is absolutely nothing more in it*. For this doctrine, he invented the name *pragmatism*."

After saying that some of his friends wished him to call the doctrine practicism or practicalism, he says that he had learned philosophy from Kant, and that to one "who still thought in Kantian terms most readily,

[1] See article on "Pragmatism," in "Baldwin's Dictionary," Vol. II, p. 322, and the *Monist*, Vol. 15, p. 162.

praktisch and *pragmatisch* were as far apart as the two poles, the former belonging to a region of thought where no mind of the experimentalist type can ever make sure of solid ground under his feet, the latter expressing relation to some definite human purpose. Now quite the most striking feature of the new theory was its recognition of an inseparable connection between rational cognition and human purpose."[2]

From this brief statement, it will be noted that Peirce confined the significance of the term to the determination of the meaning of terms, or better, propositions; the theory was not, of itself, a theory of the test, or the truth, of propositions. Hence the title of his original article: "How to Make Ideas *Clear*." In his later writing, after the term had been used as a theory of truth, – he proposed the more limited "pragmaticism" to designate his original specific meaning.[3] But even with respect to the meaning of propositions, there is a marked difference between his pragmaticism and the pragmatism of, say, James. Some of the critics (especially continental) of the latter would have saved themselves some futile beating of the air, if they had reacted to James's statements instead of to their own associations with the word "pragmatic." Thus James says in his California address: "The effective meaning of any philosophic proposition can always be brought down to some particular consequence, in our future practical experience, whether active or passive; the point lying rather in the fact that the experience must be *particular*, than in the fact that it must be *active*." (Italics mine.)

Now the curious fact is that Peirce puts more emphasis upon practice (or conduct) and less upon the particular; in fact, he transfers the emphasis to the general. The following passage is worth quotation because of the definiteness with which it identifies meaning with both the future and with the general. "The rational meaning of every proposition lies in the future. How so? The meaning of a proposition is itself a proposition. Indeed, it is no other than the very proposition of which it is the meaning: it is a translation of it. But of the myriads of forms into which a proposition may be translated, which is that one which is to be called its very meaning? It is, according to the pragmaticist, that form in which the proposition becomes applicable to human conduct, not in these or those special circumstances nor when one entertains this or that special design, but that form which is most applicable to self-control under every situation and to every purpose." Hence, "it must be simply the general

[2] Kant discriminates the laws of morality, which are *a priori*, from rules of skill, having to do with technique or art, and counsels of prudence, having to do with welfare. The latter he calls pragmatic; the *a priori* laws practical. See "Metaphysics of Morals," Abbott's trans., pp. 33 and 34.

[3] See the article in the *Monist* already mentioned, and another one in the same volume, p. 481, "The Issues of Pragmaticism."

description of all the experimental phenomena which the assertion of the proposition virtually predicts." Or, paraphrasing, pragmatism identifies meaning with formation of a habit, or way of acting having the greatest generality possible, or the widest range of application to particulars. Since habits or ways of acting are just as real as particulars, it is committed to a belief in the reality of "universals." Hence it is not a doctrine of phenomenalism, for while the richness of phenomena lies in their sensuous quality, pragmatism does not intend to define these (leaving them, as it were, to speak for themselves), but "eliminates their sential element, and endeavors to define the rational purport, and this it finds in the purposive bearing of the word or proposition in question." Moreover, not only are generals real, but they are physically efficient. The meanings "the air is stuffy" and "stuffy air is unwholesome" may determine, for example, the opening of the window. Accordingly on the ethical side, "the pragmaticist does not make the *summum bonum* to consist in action, but makes it to consist in that process of evolution whereby the existent comes more and more to embody those generals...; in other words, becomes, through action an embodiment of rational purports or habits generalized as widely as possible."[4]

The passages quoted should be compared with what Peirce has to say in the Baldwin Dictionary article. There he says that James's doctrine seems to commit us to the belief "that the end of man is action – a stoical maxim which does not commend itself as forcibly to the present writer at the age of sixty as it did at thirty. If it be admitted, on the contrary, that action wants an end, and that the end must be something of a general description, then the spirit of the maxim itself ... would direct us toward something different from practical facts, namely, to general ideas.... The only ultimate good which the practical facts to which the maxim directs attention can subserve is to further the development of concrete reasonablness.... Almost everybody will now agree that the ultimate good lies in the evolutionary process in some way. If so, it is not in individual reactions in their segregation, but in something general or continuous. Synechism is founded on the notion that the coalescence, the becoming continuous, the becoming governed by laws, the becoming instinct with general ideas, are but phases of one and the same process of the growth of reasonableness. This is first shown to be true with mathematical exactitude in the field of logic, and is thence inferred to hold good metaphysically. It is not opposed to pragmaticism ... but includes that procedure as a step."

[4] It is probably fair to see here an empirical rendering of the Kantian generality of moral action, while the distinction and connection of "rational purport" and "sensible particular" have also obvious Kantian associations.

Here again we have the doctrine of pragmaticism as a doctrine that meaning or rational purport resides in the setting up of habits or generalized methods, a doctrine passing over into the metaphysics of synechism. It will be well now to recur explicitly to Peirce's earlier doctrine which he seems to qualify – although, as he notes, he upheld the doctrine of the reality of generals even at the earlier period. Peirce sets out, in his article on the "Fixation of Belief,"[5] with the empirical difference of doubt and belief expressed in the facts that belief determines a habit while doubt does not, and that belief is calm and satisfactory while doubt is an uneasy and dissatisfied state from which we struggle to emerge; to attain, that is, a state of belief, a struggle which may be called inquiry. The sole object of inquiry is the fixation of belief. The scientific method of fixation has, however, certain rivals: one is that of "tenacity" – constant reiteration, dwelling upon everything conducive to the belief, avoidance of everything which might unsettle it – the will to believe. The method breaks down in practice because of man's social nature; we have to take account of contrary beliefs in others, so that the real problem is to fix the belief of the community; for otherwise our own belief is precariously exposed to attack and doubt. Hence the resort to the method of authority. This method breaks down in time by the fact that authority can not fix all beliefs in all their details, and because of the conflict which arises between organized traditions. There may then be recourse to what is "agreeable to reason" – a method potent in formation of taste and in esthetic productions and in the history of philosophy, – but a method which again fails to secure permanent agreements in society, and so leaves individual belief at the mercy of attack. Hence, finally, recourse to science, whose fundamental hypothesis is this: "There are real things, whose characters are entirely independent of our opinions about them; those realities affect our senses according to regular laws, and ... by taking advantage of the laws of perception, we can ascertain *by reasoning* how things really are, and any man, if he have sufficient experience and reason enough about it, will be led to the one true conclusion."[6]

It will be noted that the quotation employs the terms "reality" and "truth," while it makes them a part of the statement of the *hypothesis* entertained in scientific procedure. Upon such a basis, what meanings attach to the terms "reality" and "truth"? Since they are general terms, their meanings must be determined on the basis of the effects, having practical bearings, which the object of our conception has. Now the effect which real things have is to cause

[5] *Popular Science Monthly,* Volume XII, pp. 1–15. It is much to be desired that the series of articles be printed in book form. Discussion since 1878 has caught up with Peirce, and his views would awaken much more response now than when published.

[6] *Ibid.,* p. 11.

beliefs; beliefs are then the consequences which give the general term reality a "rational purport." And on the assumption of the scientific method, the *distinguishing* character of the *real* object must be that it tends to produce a single universally accepted belief." All the followers of science are fully persuaded that the processes of investigation, if only pushed far enough, will give one certain solution to every question to which they can be applied." "This activity of thought by which we are carried, not where we wish, but to a foreordained goal, is like the operation of destiny.... This great law is embodied in the conception of truth and reality. The opinion which is fated to be ultimately agreed to by all *who investigate*, is what we mean by the truth, and the object represented in this opinion is the real."[7] In a subsequent essay (on the "Probability of Induction") Peirce expressly draws the conclusion which follows from this statement; viz., that this conception of truth and reality makes everything depend upon the character of the methods of inquiry and inference by which conclusions are reached. "In the case of synthetic inferences we know only the degree of trustworthiness of our proceeding. As all knowledge comes from synthetic inference, we must also infer that all human certainty consists merely in our knowing that the processes by which our knowledge has been derived are such as must generally have led to true conclusions"[8] – true conclusions, once more, being those which command the agreement of competent inquiries.

Summing up, we may say that Peirce's pragmaticism is a doctrine concerning the meaning, conception, or rational purport of objects, namely, that these consist in the "effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object."[9] "Our idea of anything is our idea of its sensible effects," and if we have any doubt as to whether we really believe the effects to be sensible or no, we have only to ask ourselves whether or no we should act any differently in their presence. In short our own responses to sensory stimuli are the ultimate, or testing, ingredients in our conception of an object. In the literal sense of the word pragmatist, therefore, Peirce is more of a pragmatist than James.

He is also less of a nominalist. That is to say, he emphasizes much less the *particular* sensible consequence, and much more the habit, the generic attitude of response, set up in consequence of experiences with a thing. In the passage in the Dictionary already quoted he speaks as if in his later life he attached less importance to action, and more to "concrete reasonableness" than in his earlier writing. It may well be that the relative emphasis had shifted. But there

[7] *Ibid.*, pp. 298–300, *passim.*

[8] *Ibid.*, p. 718.

[9] *Ibid.*, p. 293.

is at most but a difference of emphasis. For in his later doctrine,concrete rationality means a change in existence brought about *through* action, and through action which embodies conceptions whose own specific existence consists in habitual attitudes of response. In his earlier writing, the emphasis upon habits, as something generic, is explicit. "What a thing means is simply what habits it involves."[10] More elaborately, "Induction infers a rule. Now the belief of a rule is a habit. That a habit is a rule, active in us, is evident. That every belief is of the nature of a habit, in so far as it is of a general character, has been shown in the earlier papers of this series."[11]

The difference between Peirce and James which next strikes us is the greater emphasis placed by the former upon the method of procedure. As the quotations already made show, everything ultimately turned, for Peirce, upon the trustworthiness of the procedures of inquiry. Hence his high estimate of logic, as compared with James – at least James in his later days. Hence also his definite rejection of the appeal to the Will to Believe – under the form of what he calls the method of tenacity. Closely associated with this is the fact that Peirce has a more explicit dependence upon the social factor than has James. The appeal in Peirce is essentially to the consensus of those who have investigated, using methods which are capable of employment by all. It is the need for social agreement, and the fact that in its absence "the method of tenacity" will be exposed to disintegration from without, which finally forces upon mankind the wider and wider utilization of the scientific method.

Finally, both Peirce and James are realists. The reasonings of both depend upon the assumption of real things which really have effects or consequences. Of the two, Peirce makes clearer the fact that in philosophy at least we are dealing with the *conception* of reality, with reality as a term having rational purport, and hence with something whose meaning is itself to be determined in terms of consequences. That "reality" means the object of those beliefs which have, after prolonged and cooperative inquiry, become stable, and "truth" the quality of these beliefs is a logical consequence of this position. Thus while "we may define the real as that whose characters are independent of what anybody may think them to be ... it would be a great mistake to suppose that this definition makes the idea of reality perfectly clear."[12] For it is only the outcome of persistent and conjoint inquiry which enables us to give intelligible meaning in the concrete to the expression "characters independent of what anybody may think them to be." (This is the pragmatic way out of the egocentric predicament.) And while my purpose is wholly expository I can not close without inquiring whether recourse to Peirce would not have a most

[10] *Ibid.*, p. 292.

[11] *Popular Science Monthly,* Vol. XIII, p. 481.

[12] *Popular Science Monthly,* Vol. XII, P. 298.

beneficial influence in contemporary discussion. Do not a large part of our epistemological difficulties arise from an attempt to define the "real" as something given prior to reflective inquiry instead of as that which reflective inquiry is forced to reach and to which when it is reached belief can stably cling?

CHARLES S. PEIRCE AT THE JOHNS HOPKINS

Christine Ladd-Franklin. "Charles S. Peirce at the Johns Hopkins." *Journal of Philosophy, Psychology and Scientific Methods* 13.26 (21 December 1916): 715–722.

The keenest pleasure which can offer itself to the university student who is about to grapple with the profoundest thinking that the world has done and is doing is his when he finds himself by chance in the actual presence of one of the creators of the world's store of thought. This had been the happy lot of the students of the Johns Hopkins University from its opening days. They felt, with reason, that they were assisting at the foundation of an important new development in university life in this country. For the first time the atmosphere of the great European centers of research had been created in America. Departments headed by such men as Sylvester, Gildersleeve, Remsen, Rowland, Martin, a group of scholars all fitted to inspire their students with the ardor of research – this was something new. To this atmosphere the students of those early days, reinforced by enthusiastic young *docents* fresh from their experience of the then simple and ideal German university life, responded with due appreciation of the lucky days upon which they had fallen. Probably there has never been in this country a center of learning where the conditions were more ideal for producing in its best form the joy of the intellectual life – nor a group of students better fitted to profit by their novel opportunities. To share the life of this ardent body of workers was, they one and all felt, an experience to be remembered.

To this group of students, eager for intellectual adventure, came, in 1880–1881, Charles S. Peirce. His reputation had preceded him, and his hearers were quickly receptive to the inspiration to be had from one more master mind. Sylvester and Peirce both possessed recognized elements of the temperament of genius – a thing which adds much to the effectiveness of personal intercourse with a great man – but that temperament was exhibited in them in very different forms. Sylvester was as oblivious as Peirce of the presence of his audience (though he did once by chance discover, to his evident amazement, that his most distinguished auditor, Professor Cayley, was fast asleep, his bald head frankly covered with his handkerchief), but he had a boyish enthusiasm which was in full harmony with his fresh English color and his nervous Jewish temperament. He was always brimming over with the importance of his subject-matter, which

had usually been produced during the three days' interval between his lectures, and which was brought forth with the keen joy of the immediate discoverer. Peirce, on the contrary, was of the brooding type. He sat when he addressed his handful of students (who turned out afterwards, however, to be a not unimportant handful) and he had all the air, as has been noted by Professor Jastrow, of the typical philosopher who is engaged, at the moment, in bringing fresh truth by divination out of some inexhaustible well. He got his effect not by anything that could be called an inspiring personality, in the usual sense of the term, but rather by creating the impression that we had before us a profound, original, dispassionate and impassioned seeker of truth. No effort was made to create a connected and not inconsistent whole out of the matter of each lecture. In fact, so devious and unpredictable was his course that he once, to the delight of his students, proposed at the end of his lecture, that we should form (for greater freedom of discussion) a Metaphysical Club, though he had begun the lecture by defining metaphysics to be "the science of unclear thinking."

Several of Professor Sylvester's students – understanding that the New Logic which Professor Peirce professed had connections with existing mathematics and that, even if it had not, it was something which, unlike the mechanical logical exercises of the schools, was expected to have a vivifying and clarifying effect upon one's actual reasoning processes – joined his class in logic, composed otherwise, of course, of students of philosophy. This mixed character of the audience, as is too often the case in lectures on modern logic, made it impossible for the lecturer to adapt his subject-matter with exactness to the needs of either part. Peirce's lectures did not go very extensively into the details of his mathematical logic (Symbol Logic, I maintain, is the only proper name for it, and I note with pleasure that Dr. Karl Schmidt has adopted this term). His lectures on philosophical logic we should doubtless have followed to much greater advantage if he had recommended to us to read his masterly series of articles on the subject which had already appeared in the *Popular Science Monthly* in 1878 under the title "Some Illustrations of the Logic of Science." We should have had from these at first hand a better idea of "how to make our ideas clear" concerning the methods of science as he understood them. But that, in spite of his apparent aloofness and air of irresponsibility, he really had the interests of his hearers deeply at heart will appear from a sympathetic letter which he wrote me some years later, when I came to lecture myself on logic at the Johns Hopkins University:

MILFORD, PA.
Thanksgiving Day, 1902

My dear Mrs. Franklin: It gives me joy to learn that you are to lecture on logic at the Johns Hopkins. But, oh, you will not have such a wonderful and charming class as I had, especially the first year. In those days I knew very little about logic, and did not even thoroughly understand upon what logic is based.

I was not in possession of the proof that the science of logic must be based on the science of ethics, although I more or less perceived that sound reasoning depends more on sound morals than anything else. I at any rate tried hard to see what I was about, and not to build logic upon anything that must on the contrary be built upon it. In a certain measure I appreciated the precise nature of the utility of logic, and rated it high; but I did not know what I know now. I am finding out every day something new to me in logic.

I wish most earnestly that you may succeed in animating your students with the true spirit of science and of logic, and that is the very greatest happiness I could wish for you. Whether you do or not depends chiefly on how much you care to do so. – I return Keynes.

Very faithfully,

C. S. PEIRCE.

P. S. I hope that Schröder's manuscripts will be printed. I would do anything in my power to that end. Can't you find out what is needed?

The following letter, which I have quoted in part, indicates, among other things, the extreme value which Peirce attributed to his form of pragmatism. The important collection of his reprints which he presented to me at this time, I have now deposited in the library of Columbia University. This letter, too, is not so much a personal letter as it is a definitive setting out of some of his views and experiences; if he has left no complete autobiography, it should furnish important material concerning the wonderful intellectual life which he took part in, in Cambridge, during his early years.

My dear Mrs. Franklin: It is most kind of you to think of me and of doing what you propose, and it happens that, just at this time, it would be very serviceable to me. For in a forthcoming number of the *Monist*, I am to have an article about pragmatism, explaining what I conceive it to be. Although James calls himself a pragmatist, and no doubt he derived his ideas on the subject from me, yet there is a most essential difference between his pragmatism and mine. My point is that the meaning of a *concept* ... lies in the manner in which it could *conceivably* modify purposive action, and *in this alone*. James, on the contrary, whose natural turn of mind is away from generals, and who is besides so soaked in ultra-sensationalist psychology that like most modern psychologists he has almost lost the power of regarding matters from the logical point of view, in defining pragmatism, speaks of it as referring ideas to *experiences*, meaning evidently the sensational side of experience, while I regard *concepts* as affairs of habit or disposition, and of how we should react. Without particularly referring to him, my *Monist* article (already sent in and accepted) is to explain what my position is; and I desire to follow it up by two others, of which the first shall show how this

principle at once affords solutions of a great variety of problems, and shall show what the general color of those solutions is, while the third article shall show what facts and phenomena I appeal to as proving the truth of the pragmatist principle. But it is altogether problematical whether the second and third articles ever appear. It all depends upon whether the readers of the *Monist* are interested in the first article. Now if you were to write what you propose, it would call attention to the first article, increase the sales of that number of the *Monist*, and render the acceptance of a second much more likely. I have no fears but that the second should excite of itself sufficient interest to insure the third; but the first, being a definition of an individual opinion, is not calculated to attract new readers.

It is true that I have not received much credit either for pragmatism or any other part of my work. However, as it was not done for the sake of anything of that kind, I have no reason to complain. What I expected to gain when I did it, I have gained. I began on the scale of printing a logical research every month. My motive then was a mixed one. I wanted the statement of my results in print for my own convenience in referring to them, and I thought it would be a gain to civilization to have my entire logical system. But after a very few months, I found that nobody took any notice of my papers, and I lost all interest in their publication, and simply filed away my mss. for my own use.

It must have been about 1857 when I first made the acquaintance of Chauncey Wright, a mind about on the level of J. S. Mill. He was a thorough mathematician of the species that flourished at that time, when dynamics was regarded (in America) as the top of mathematics. He had a most penetrating intellect. There were a lot of superior men in Cambridge at that time. I doubt if they could have been matched in any other society as small that existed at that time anywhere in the world. Wright, whose acquaintance I made at the house of Mrs. Lowell, was at that time a thorough Hamiltonian; but soon after he turned and became a great admirer of Mill. He and I used to have long and very lively and *close* disputations lasting two or three hours daily for many years. In the sixties I started a little club called the Metaphysical Club. It seldom if ever had more than half a dozen present. Wright was the strongest member and probably I was next. Nicholas St. John Green was a marvelously strong intelligence. Then there were Frank Abbott, William James, and others. It was there that the name and the doctrine of pragmatism saw the light. There was in particular one paper of mine that was much admired and the ms. went around to different members who wished to go over it more closely than they could do in hearing it read. While I was in charge of the Coast Survey office in 1873, I employed some Sundays in putting that piece into a literary form, though without any intention of printing it. But in 1875 or 1876 I met old William Appleton, the publisher, on a steamer, and he offered me a good round price for some articles for the *Popular Science Monthly*. I patched up the piece I speak of for the first; and it appeared in November, 1877. In the autumn of 1877 I

went abroad in order to urge a certain truth upon the Geodetical Association. As I should have to speak in French and conduct a discussion in that language, by way of practise I began and finished on the voyage between Hoboken and Plymouth an article about pragmatism in French. I afterward translated into French my article of November, 1877, and these two appeared in the *Revue Philosophique*, about Volume VI. I left in the library of the J. H. University a bound volume of my pieces containing these two. I have not a copy of either now. I should say that the *word* pragmatism does not appear in that article, nor did I insert it in the *Century Dictionary* or ever use it in print previous to the article in Baldwin's Dictionary. I translated the steamer article into English and in that dress it appeared in the *Popular Science* of January, 1878, some time previous to the publication of the original text.

There never was the smallest disloyalty on James's part. On the contrary, he has dragged in mention of me whenever he could.

In the spring of 1903 I was invited, by the influence of James, Royce, and Münsterberg, to give a course of lectures in Harvard University on Pragmatism. I had intended to print them; but James said he could not understand them himself and could not recommend their being printed. I do not myself think there is any difficulty in understanding them, but all modern psychologists are so soaked with sensationalism that they can not understand anything that does not mean that, and mistranslate into the ideas of Wundt whatever one says about logic.... How can I, to whom nothing seems so thoroughly real as generals, and who regard Truth and Justice as *literally* the most powerful powers in the world, expect to be understood by the thoroughgoing Wundtian? But the curious thing is to see Absolute Idealists tainted with this disease, – or men who, like John Dewey, hover between Absolute Idealism and Sensationalism. Royce's opinions as developed in his *World and Individual* are extremely near to mine. His insistence on the element of purpose in intellectual concepts is essentially the pragmatistic position....

Pragmatism is one of the results of my study of the formal laws of signs, a study guided by mathematics and by the familiar facts of everyday experience and by no other science whatever. It is a maxim of logic from which issues a metaphysics very easily. It solves almost all problems of metaphysics in short metre and it solves them in such a way as never to bar the way of any positive inquiry. It also has the gratifying effect of encouraging the simplest ideas of religion and anthropomorphie conceptions of the Absolute.

I have some of my quarto papers bound up together and I am sending you this volume begging your acceptance of it. I wish I had copies of some of my octavo papers bound up; but I have not. I have some loose copies of some of them which I would have bound for you; but one never knows when a binder is going to send one's books home. One only knows that he will try to do so in time to get the bill paid before both parties die. So I send such papers as I can find, as they are, along with a few newspapers containing articles on

"French Academy," "Napoleon Bonaparte," "Great Men of the Nineteenth Century," etc.

With best regards to Mr. Franklin,
Very faithfully,
C. S. PEIRCE.

Professor Peirce had a mind of great originality and productiveness; he lacked, no doubt, as do too many geniuses, that keen self-criticism which would have enabled him to distinguish rigidly, in what he produced, between the wheat and the chaff. Much of what he wrote, especially during the later years of his life, was incomprehensible beyond even the privilege of the maker of new philosophies; articles in the *Monist* which William James has said will be a rich mine for the future student will just as probably remain forever indecipherable by him. Once when I was in search of an article of his which had lately appeared in the *Monist*, entitled, in Shakespeare's phrase, "Man's Glassy Essence," and could not remember its name, the young librarian who assisted me said, "Oh yes, – you mean the article on 'Glacial Man'" – a title which would doubtless have served as well as the other. Indeed, many of his contributions to the philosophical dictionary were of the purely cabalistic type. The second part of the article on Symbolic Logic, for instance, was finally, against the urgent advice of Professor Couturat, who had himself contributed the admirable first part, sent to the printer, though it is doubtful if any one will ever be able to read it.[1] But it will never be known what reams of closely written matter were excluded! Professor Peirce had already completed a great part of a book on logic, largely medieval logic, which (save for what came out in the Dictionary) he was never in a position to publish: his future disciples will no doubt see to it that this great work is eventually given to the press. So difficult at the time, however, was the rejection, in the interest of sanity, of such a mass of closely written pages that at last I found it necessary to call in the aid of my husband, who undertook to play the traditionally unpleasant rôle of the candid friend. The ingrained sweetness of Peirce's character – an essential to the acceptance of irksome criticism – is here brought into evidence; in fact, this bit of correspondence may perhaps be regarded as a model of its type, – no easy type.

[MILFORD, PA., NOV., 1900.]
My dear Mrs. Franklin:

I want you kindly to read the enclosed article Exact Logic and show it to your husband whose judgment I have much faith in, if he will be so good as to look at it. I told Prof. Baldwin when I took up this work that I should

[1] The death of Professor Couturat, who was run over by a military autotruck at the beginning of the war, is one of the many irreparable losses of the European war.

expect "unlimited swing" in exact logic. Still, I don't know but it is too much to ask him to print this; and I don't want to ask what is not right. The purpose of it is to put Exact Logic in its place as a branch of philosophy. It is an extremely careful statement of the small ground it covers. I do not see how I could say less without reducing it to a general statement that would be without force. I am too close to it to get a good mental sight at it. I request you to read it and tell me plainly whether it seems to you and your husband calculated to do the cause of exact logic any good, ... also whether there are any modifications you can suggest, especially to shorten it. A short vocabulary of terms omitted in Vol. I of the Dictionary will have to be added. You had better, I should think, follow my example in this respect in your articles, inserting, for instance, ... I should not wonder, if you look into my Virgo symbol, but you might find it resulted in a valuable rule of elimination.

Very faithfully,

C. S. PEIRCE.

My dear Mr. Peirce,

... I feel bound to say that, according to my notion of such a work – one, to be sure, very commonplace in comparison with that which you entertain – an article in a cooperative dictionary such as this should not be devoted to pioneer work, however eminent the writer of it, but to the exposition of what is either fairly well established and current or, if not, is capable of being so expressed within the necessary limits as to be intelligible to the ordinary properly-equipped reader. Now, the views which you lay down in your article seem to me absolutely to require for their adequately intelligible presentation far more space than you have given to them, and, *a fortiori*, far more space than the dictionary can spare....

Very faithfully yours,

F. FRANKLIN.

MILFORD, PA., 1900, NOV.

My dear Franklin:

Your letter is at hand. I asked of you a disagreeable thing, and I thank you for having done it so faithfully. Would there were more courage between friends! You give me wholesome counsel, and I shall follow it, notwithstanding the suggestions of the Evil One.

Yours faithfully,

C. S. PEIRCE.

This same advice, might, I have no doubt, have been repeated to advantage under later letters of the alphabet.

If Charles S. Peirce had happened to have a longer period of activity at the Johns Hopkins University – if the years had not been cut off during which he

was kept upon the solid ground of intelligible reason by discussions with a constantly growing group of level-minded students, – there is no doubt that his work would have been of more certain value than it can be affirmed to be now; it is probable, for instance, that his grateful pupil, William James, would not have found his generously provided for Lowell lectures too incomprehensible to be printed at the time. At the meetings of the Philosophical Congresse in Göttingen, in 1908, Peirce had two warm defenders of his views, as against the James form of pragmatism, in the Italian philosophers, Calderoni and Vailati. Vailati, a man of most acute intellect, is no longer living; Calderoni would no doubt be able to throw much illumination – more perhaps than any other living writer – upon the real bearing of the philosophical views of Mr. Peirce.

CHARLES S. PEIRCE AS A TEACHER

Joseph Jastrow. "Charles S. Peirce as a Teacher." *Journal of Philosophy, Psychology and Scientific Methods* 13.26 (21 December 1916): 723–726.

To record an impression of Charles S. Peirce as a teacher is a grateful opportunity. A deep conviction of the significance of the problems presented and a mastery of the intellectual processes were his sole and adequate pedagogical equipment. The logical quality was the dominant trait of his thinking; rectitude became a rational virtue. In the deductive field where premises were sharply defined and under control, the orderly development of conclusions was the true function of the well-trained mind, and the mark of the scholar. The "Algebra of Logic" was an expert tool usable only by the expert and extending the scope of the logical grasp. Deeply mathematical, his thinking had not the trace of a scholastic quality; there was no love of the tool for its own sake, but an admiration of its cutting edge as the issue of human care and skill. His interests were comprehensive, though not scattered. In the field of inductive problems the fertility of his resources imparted a breadth to his treatment that brought to the student the constant leadership of a rich mind. His knowledge never gave the impression of a burden, but of strength. His command of the history of science was encyclopedic in the best sense of the word. The hypotheses of the great thinkers of the past were transformed into logical exercises for the present-day student. The great advances of science were due as much (if not more) to an increased hold over the logical instrument as to an enlarged realm of observation. The history of science was a record of man's growth in logical stature. In dealing with the more fluid and versatile considerations of induction, as in the more rigid and closed systems of deductive reasoning, the skilled focusing of his mind excited admiration. The irrelevant was discarded, the significant composition revealed. The chips fell away and the statue in the block appeared. This sense of masterly analysis accomplished with neatness and dispatch, – all seemingly easy, but actually the quality of the highest type of keen thinking – remains as the central impression of a lecture by Professor Peirce.

When I came to the Johns Hopkins University in the autumn of 1882, Mr. Peirce's career was well established. He had inspired a remarkable group of young men, now leaders in intellectual affairs; a group to which is to be added the name of Christine Ladd-Franklin, whose exceptional abilities secured for her exceptional privileges. The *Studies in Logic* by "Members of the Johns

Hopkins University" appeared in 1883. The concluding paper which Mr. Peirce contributed to the volume on "A Theory of Probable Inference" exhibits the qualities of his teaching and the charm and lucidity of his language, and remains an admirable example of the construction of his thought and the finish of his art. I refer to it because it reflects the interplay of logical and psychological trends, which he developed as a fertile principle of interpretation. Logic was an emanation of habit; the trend was biological, the product required the schooling of discipline and the inspiration of genius. It was this side of his teaching that gave the humanistic value; out of it grew the insight that made him the father of pragmatism. The doctrine had a distinct pedagogical value; it made the student feel the reality of the discussions by adding a moderate insight to a growing capacity. "In point of fact a syllogism in Barbara virtually takes place when we irritate the foot of a decapitated frog." After developing the idea, he concludes: "Although these analogies, like all very broad generalizations, may seem very fanciful at first sight, yet the more the reader reflects upon them, the more profoundly true I am confident they will appear. They give a significance to the ancient system of formal logic which no other can at all share."

My predilections at that formative period were, I must confess, rather negative. My college course had left me with a series of dislikes, not violent, but distinctive. By elimination I enrolled as a student in philosophy. Mr. Peirce's courses in logic gave me my first real experience of intellectual muscle. Though I promptly took to the laboratory of psychology when that was established by Stanley Hall, it was Peirce who gave me my first training in the handling of a psychological problem, and at the same time stimulated my self-esteem by entrusting me, then fairly innocent of any laboratory habits, with a real bit of research. He borrowed the apparatus for me, which I took to my room, installed at my window, and with which, when conditions of illumination were right, I took the observations. The results were published over our joint names in the *Proceedings of the National Academy of Science*. The demonstration that traces of sensory effect too slight to make any registry in consciousness could none the less influence judgment, may itself have been a persistent motive that induced me years later to undertake a book on "The Subconscious."

As a further illustration of his fertile suggestiveness and use of cooperative stimulus I mention his study of great men. He prepared an elaborate question-sheet regarding the ancestry, qualities of mind and body, mode of work, stages of growth, etc., of the great men of all times. He invited a small group of students to join him in reading the chief biographies of great men and extracting the data that might furnish the entries for the syllabus. We then held conferences for the discussion and tabulation of the results. The project was never completed. A number of years later, I was permitted to formulate two rather simple conclusions, the one relating to "Longevity," the other to

"Precocity." This was done at a time when such studies were not general, though Galton's work was known. Such a conclusion as that later associated with Dr. Osler's misquoted verdict regarding the correlation of early manhood with germinal ideas, was anticipated in this study. Such were his methods.

Mr. Peirce's personality was affected by a superficial reticence often associated with the scientific temperament. He readily gave the impression of being unsocial, possibly cold, more truly retiring. At bottom the trait was in the nature of a refined shyness, an embarrassment in the presence of the small talk and introductory salutations intruded by convention to start one's mind. His nature was generously hospitable; he was an intellectual host. In that respect he was eminently fitted to become the leader of a select band of disciples. Under more fortunate circumstances, his academic usefulness might have been vastly extended. For he had the pedagogic gift to an unusual degree, had it by dower of nature, as some men handle a pencil and others the bow of a violin. It may be an inevitable result of the conventional system of education, but it is none the less a sad one, that his type of ability does not flourish readily in an institutionalized atmosphere; and no university had a more wholesome atmosphere than had Johns Hopkins in those days. The moral, if there be one, is that systems must give way to personalities, if the best talents of the best men are to be available.

The young men in my group who were admitted to his circle found him a most agreeable companion. The terms of equality upon which he met us were not in the way of flattery, for they were too spontaneous and sincere. We were members of his "scientific" fraternity; greetings were brief, and we proceeded to the business that brought us together, in which he and we found more pleasure than in anything else. This type of cooperation and delegation of responsibility came as near to a pedagogical device as any method that he used. One instance of it stands out with embarrassing clearness. To my consternation I was informed by Mr. Peirce that he would be absent at the time of the next lecture in logic, and that he would like me to present the next stage in the development of his topic to the class of graduate students. About half the hour was over, when Mr. Peirce walked in, took his place and insisted upon my concluding the exercise. I know of no more enlightening comment upon the atmosphere of the place and the day than that the procedure was accepted naturally by all concerned except myself.

It should be mentioned that during these years Mr. Peirce was continuing his work in the Geodetic Survey and was thus carrying on a considerable range of scientific work of quite different scope. He came of a family of exact scientific men with academic traditions. It needed no change of manner or interest to set his activities in the professorial direction. By those who knew him in other relations I am confirmed in my impression that he had more pleasure in the academic pursuits. To these he turned when he retired, recognizing in his work as a scholar surveying broadly the field of intellect, the

strongest bent of his versatile mind. To those who believe that for the training of the leaders of men, nothing is more inspiring and more helpful than training by example – than the privilege of association in the cooperative spirit with a master mind – the example of Charles S. Peirce will continue to remain a cherished memory. An educational policy that makes it possible to find a place for such men as Peirce in the faculties of the great universities is a worthy ambition for those who control the educational future of America.

CHARLES S. PEIRCE

Morris R. Cohen. "Charles S. Peirce and a Tentative Bibliography of His Published Writings." *Journal of Philosophy, Psychology and Scientific Methods* 13.26 (21 December 1916): 726–733, omitting the outdated bibliography on pp. 733–739.

Though I have not stood in any peculiar relation to Charles S. Peirce, and can not speak authoritatively on the various phases of his extraordinarily diversified intellectual activity, I can not refuse the editors' courteous invitation to add a few words of "philosophic piety" in tribute to one of the few great seminal minds that America has produced.

Many and diverse are the minds that form the philosophic community. There are, first and foremost, the great masters, the system builders who rear their stately palaces towering to the moon. These architectonic minds are served by a varied host of followers and auxiliaries. Some provide the furnishings to make these mystic mansions of the mind more commodious, while others are engaged in making their façades more imposing. Some are busy strengthening weak places or building much-needed additions, while many more are engaged in defending these structures against the impetuous army of critics who are ever eager and ready to pounce down upon and destroy all that is new or bears the mortal mark of human imperfection. There are also the philologists, those who are in a more narrow sense scholars, who dig not only for facts or roots, but also for the stones which may serve either for building or as weapons of destruction. Remote from all these, however, are the intellectual rovers who, in their search for new fields, venture into the thick jungle that surrounds the little patch of cultivated science. They are not gregarious creatures, these lonely pioneers; and in their isolation they often completely lose touch with those who tread only the beaten paths, so that no one learns of their green pastures or knows their final burial ground. Those that return to the community often speak of strange things or use strange words; and it is but seldom that they arouse sufficient faith for others to follow them and change their trails into high roads.

Few nowadays would question the great value of these pioneer minds; and it is often asserted that universities are established to facilitate their work, and prevent it from being lost. But universities, like other well-managed institutions, can find place only for those who can work well in harness. The restless, impatient minds, like the socially or conventionally unacceptable,

must thus be kept out, no matter how fruitful their originality. Charles S. Peirce was certainly one of these restless pioneer souls with the divine gift of seeing the hitherto invisible. In his early papers, in the *Journal of Speculative Philosophy*, and in his later papers, in the *Monist*, we get indeed glimpses of a vast philosophic system on which he was working with an unusual wealth of material and apparatus. He had, indeed, one of the most essential gifts of successful system builders, the power to coin an apt and striking terminology. But I am not certain that he could ever have completed this work, *i.e.*, I can not in my own imagination see how the various lines of his thought can be made to meet. However, that his was a mind unusually fruitful in strikingly original suggestions, no careful, open-minded reader of his writings will deny. That these writings have been so sadly neglected – that even now no collected edition of them is available – is to be accounted for only by the fact that isolation and neglect are the penalty for those who stray from the beaten path and refuse to bow to the reigning idols.

In one respect Peirce has certainly been most fortunate. Two such gifted and powerful minds as those of William James and Josiah Royce have been able to follow some of the directions from his Pisgah heights and have thus conquered rich philosophic domains. That further domains await those who can decipher other of his cryptic directions can, of course, only be a question of faith.

Of Royce's indebtedness to Peirce an eloquent testimony is contained in the preface to the *Problem of Christianity*. In view, however, of Professor Howison's misunderstanding of that passage and its motive,[1] a student of Professor Royce may be allowed to testify to the frequency and generosity with which Professor Royce has, in his lectures and seminars, referred to the doctrines of Peirce. Besides, did not Professor Royce already indicate his indebtedness to Peirce in the preface to the *World and the Individual*, in 1899? Any one who reads Peirce's essay on the "Law of Mind"[2] can see for himself something of the stimulus which led Royce to the utilization of modern mathematical researches in the service of idealistic philosophy. Royce's doctrines of social consciousness, of the mind of the community, and of the process of interpretation are strikingly anticipated in some of Peirce's earlier and later writings. Some of these resemblances may be due to the fact that both Peirce and Royce were close students of the frequently mentioned, but seldom read works of Schelling. But in some cases, as, *e.g.*, in the doctrine concerning the nature of mathematical reasoning and its objects, Royce follows Peirce very closely.

[2] *Monist*, Vol. II, pp. 537 ff.

James's indebtedness to Peirce in regard to pragmatism has now become widely known. But attention should be called to the fact that James was no less indebted to Peirce in regard to his radical empiricism. It was the intellectual companionship of Chauncey Wright and Charles S. Peirce that during his formative period steeled James against the transcendentalism which dominated the Cambridge of that day.[3] Wright's influence was mainly in the direction of the old empiricism of Mill and Bain which led James to Spencer's "Psychology." The unquestioning belief in eternal unalterable laws of nature, that everything that happens happens precisely in accordance with these laws, was one of the main tenets of that empiricism. For the distinctive note of his radical empiricism, the opposition to the "block universe" and the belief that the whole world is changing and growing, James was indebted to Peirce as well as to Renouvier and Boutroux.

One of our American many-volumed sources of infallible information dismisses Peirce briefly and simply as a physicist. This is perfectly true as far as it goes. For many years Peirce worked on the problems of geodesy and his contributions to the subject, notably his researches on the pendulum, were at once recognized by European investigators in this field. The International Geodetic Congress, to which he was the first American representative, gave unusual attention to his paper, and men like Cellerier and Plantamour acknowledged their obligation to him.[4] This and other scientific work involving fine measurement, with the correlative investigations into the theory of probable error, seem to have been a decisive influence in the development of Peirce's tychistic philosophy. Philosophers inexperienced in actual scientific measurement may naively accept as absolute truth such statements as "every particle of matter attracts every other particle directly as the product of their masses and inversely as the square of the distance," or "when hydrogen and oxygen combine to form water the ratio of their weights is 1:8." But to those who are actually engaged in measuring natural phenomena with instruments of precision, nature shows no such absolute constancy or simplicity. As every laboratory worker knows, no two observers, and no one observer in successive experiments, get absolutely identical results. To the men of the heroic period of science this was no difficulty. They held unquestioningly the Platonic faith that nature was created on simple geometric lines, and all the minute variations were attributable to the fault of the observer or the crudity of his instruments. This heroic faith was, and still is, a most powerful stimulus to scientific research. But few would defend it to-day in its explicit form, and there is little empirical evidence to show that while the observer and

[3] See preface to James's *Psychology*, and dedication to his "Will to Believe."

[4] See Plantamour's "Recherches Expérimentales sur le mouvement simultané d'un pendule et de ses supports," Geneva, 1878, pp. 3–4.

his instruments are always varying, the objects which he measures never deviate in the slightest from the simple law. Doubtless, as one becomes more expert in the manipulation of physical instruments, there is a noticeable diminution of the range of the personal "error," but no amount of skill and no refinement of our instruments have ever succeeded in eliminating irregular, though small, variations. "Try to verify any law of nature and you will find that the more precise your observations, the more certain they will be to show irregular departure from the law."[5] There is certainly nothing in our empirical information to prevent us from saying that all the so-called constants of nature are merely instances of variation between limits so near to each other that their difference may be neglected for certain purposes. Moreover, the approach to constancy is observed only in mass phenomena, when we are dealing with very large number of particles; but social statistics also approach constant ratios when the numbers are very large. Hence, without denying discrepancies due solely to errors of observation, Peirce has certainly ground for his contention that "we must suppose far more minute discrepancies to exist owing to the imperfect cogency of the law itself, to a certain swerving of the facts from any definite formula."[6]

To this belief in absolute chance variations, Peirce joined the doctrine that the limiting ratios which we call the laws of nature are themselves slowly changing in the course of time. According to Peirce's grandiose conception, the very tendency towards law or regularity is itself the result of an accidental variation which has grown habitual with things. A good deal of his speculation in this field sounds mythologic, yet it is inherently as probable as the mechanical mythology according to which all spontaneity and novelty in nature are a delusion. By denying that the whole world can grow or increase in being, the mechanical philosophy must deny all the seeming increase in the diversity and specificity of things, since all that really is must have been from the beginning; and we are thus led to the position of Maxwell that the fundamental atoms out of which all things are made, are to-day precisely what they were in the day of their creation.[7]

The following,[8] published in 1868, is certainly in the spirit which leads to radical empiricism. "We can not begin with complete doubt. We must begin with all the prejudices which we actually have. These prejudices are not to be dispelled by a maxim, for they are things which it does not occur to us can be questioned.... A person may, it is true, in the course of his studies find

reason to doubt what he began by believing; but in that case he doubts because he has a positive reason for it, and not on account of the Cartesian Maxim."

"Philosophy ought to imitate the successful sciences in its methods, so far as to proceed only from tangible premises which can be subjected to careful scrutiny, and to trust rather to the multitude and variety of its arguments than to the conclusiveness of any one. Its reasoning should not form a chain ... but a cable."

James certainly shared Peirce's individualistic belief that at least in the early stages of any inquiry or branch of science "independence of thought is the wholesome attitude, and gregarious thought is really sure to be wrong"; and he undoubtedly subscribed to Peirce's attitude toward that outer thoroughness characteristic of the Germans and their admirers: "These men write the larger number of those books which are so thorough and solid that every serious inquirer feels that he is obliged to read them; and his time is so engrossed by their perusal that his mind has not the leisure to digest their ideas and to reject them."[9]

In his "Pluralistic Universe," William James has called attention to the similarity between the tychistic-agapism of Peirce and the creative evolution of Bergson. But while both tend to restore life and growth to the nature of things,[10] Peirce's approach has marked logical advantages. Bergson relies heavily on certain details not very accurately reported, as, *e.g.*, the supposed identity of the vertebrate eye and the eye of the scallop or pecten, which ignores the fact that similarities of this kind may be readily explained by the mechanical principles of convergent evolution. Peirce relies more on the general logic of specificity and individuality, into which the facts adduced by Driesch may well fit, but which have a much wider appeal since they are also applicable to the facts of inorganic nature, and can not be refuted by considerations drawn from experimental biology.

A closer similarity seems to me to exist between the tychism of Peirce and the probabilism of Cournot. Both vigorously opposed that blind anancism or mechanical necessity which has become the sacred cow of scientific orthodoxy, at the same time that they extended the range of our scientific knowledge. Both also relied on the method of infinitesimals, not in the obscurantist way which forms the basis of the general distrust of that concept, but in a way to keep the respect of a mathematician like Poincaré.[11] Cournot's

massive books give the impression of a more delicate and finished mind, possessed also of a greater power of organizing his material which comes with self-mastery, but Peirce appears to me decidedly the more unconventional and the more fruitful of original insight. Peirce also had a vastly greater and more intimate knowledge of factual details, both of the history of human thought and of logical mathematical and physical methods. He knew enough of medieval logical terminology to make corrections in a work as erudite as Prantl's logic; and whenever he refers to writers like Aristotle or Kant his analyses show thorough mastery.[12] The same is true (so far as I can follow him) of his references to modern mathematical, astronomical, physical, and chemical researches. Yet his own original contributions entitle him to be regarded as one of the founders of modern symbolic logic.[13] Cournot has made more substantial contributions to the theory of history and of economics. But we gather from Peirce's chance remarks, such as his characterization of the Mugwump,[14] or of that which produces dominant opinion among professors,[15] that his eye for social facts was not undeveloped. At a time when it was considered a sign of scientific election or grace to regard all social changes as due to an immanent dialectic force, he saw clearly that the changes of social institutions and ideas depend on the change of conditions which facilitates the breaking up of habits. His keen psychologic insight is shown perhaps at its best in his attack on the now classical tradition that makes the process of thought consist of a succession of images.[16]

Recent neo-realism will find many points of contact with Peirce's vigorous anti-nominalism, and his equally vigorous opposition to the modern tendency to regard logic as a part of psychology. To the view that the laws of logic represent "the necessities of thought," that propositions are true because "we can not help thinking so," he answers: "Exact logic will say that *C*'s following logically from *A* is a state of things which no impotence of thought alone can bring about."[17] "The question of validity is purely one of fact and not of thinking. … It is not in the least the question whether, when the premises are accepted by the mind, we feel an impulse to accept the conclusion also. The

true conclusion would remain true if we had no impulse to accept it, and the false one would remain false though we could not resist the tendency to believe in it."[18]

Since the days of Locke modern philosophy has been almost entirely dominated by the assumption that one must study the process of knowing before one can find out the nature of things known; in other words, that psychology is *the* central philosophic science. The result of this has been an almost complete identification of philosophy with mental science. Nor did the influence of biologic studies of the middle of the nineteenth century shake the belief in that banal dictum of philosophic mediocrity: "The proper study of mankind is man." The recent renaissance of logical studies, and the remarkable progress of physics in our own day bid fair to remind us that while the Lockian way has brought some gains to philosophy, the more ancient way of philosophy is by no means exhausted of promise; nor has man lost his interest in the great cosmic play. Those who have faith in the ancient and fruitful approach to philosophy through the doors of mathematics and physics will find the writings of Charles S. Peirce full of suggestions. That such an approach can also throw light on the vexed problem of knowledge needs no assurance to those acquainted with Plato and Aristotle. But I may conclude by referring to Peirce's doctrine of ideal as opposed to sensible experiment, and to his treatment of the question how it is that in spite of an infinity of possible hypotheses man manages to make so many successful inductions.[19]

Section Three

Evaluations of Peirce's Pragmatism, 1920–1940

C. S. PEIRCE

Ogden, C. K. and I. A. Richards. "C. S. Peirce." *The Meaning of Meaning* (London: Routledge and Kegan Paul, 1923), Appendix D, Section 6, pp. 279–290.

By far the most elaborate and determined attempt to give an account of signs and their meaning is that of the American logician C. S. Peirce, from whom William James took the idea and the term Pragmatism, and whose Algebra of Dyadic Relations was developed by Schroeder. Unfortunately his terminology was so formidable that few have been willing to devote time to its mastery, and the work was never completed. "I am now working desperately to get written before I die a book on Logic that shall attract some minds through whom I may do some real good," he wrote to Lady Welby in December, 1908, and by the kindness of Sir Charles Welby such portions of the correspondence as serve to throw light on his published articles on Signs are here reproduced.

In a paper dated 1867, May 14th *(Proc. Am. Acad. Arts & Sci.* (Boston) VII (1868), 295), Peirce defined logic as the doctrine of the formal conditions of the truth of symbols; *i.e.*, of the reference of symbols to their objects. Later, when he "recognised that science consists in inquiry not in 'doctrine' – the history of words, not their etymology, being the key to their meanings, especially with a word so saturated with the idea of progress as science," he came to realise, as he wrote in 1908, that for a long time those who devoted themselves to discussing "the general reference of symbols to their objects would be obliged to make researches into the references to their interpretants, too, as well as into other characters of symbols, and not of symbols alone but of all sorts of signs. So that for the present, the man who makes researches into the reference of symbols to their objects will be forced to make original studies into all branches of the general theory of signs." This theory he called Semeiotic, and its essentials are developed in an article in the *Monist*, 1906, under the title, "Prolegomena to an Apology for Pragmaticism."

A sign, it is there stated, "has an *Object* and an *Interpretant*, the latter being that which the Sign produces in the Quasi-mind that is the Interpreter by determining the latter to a feeling, to an exertion, or to a Sign, which determination is the Interpretant. But it remains to point out that there are usually two Objects, and more than two Interpretants. Namely, we have to distinguish the *Immediate Object*, which is the object as the Sign itself represents

it, and whose Being is thus dependent upon the Representation of it in the sign, from the *Dynamical Object*, which is the Reality which by some means contrives to determine the Sign to its Representation. In regard to the Interpretant we have equally to distinguish in the first place, the *Immediate Interpretant*, which is the interpretant as it is revealed in the right understanding of the Sign itself, and is ordinarily called the 'meaning' of the sign; while, in the second place, we have to take note of the *Dynamical Interpretant*, which is the actual effect which the Sign, as a Sign, really determines. Finally, there is what I provisionally term the *Final Interpretant*, which refers to the manner in which the Sign tends to represent itself to be related to its Object. I confess that my own conception of this third interpretant is not yet quite free from mist."

Reference is then made to the "ten divisions of signs which have seemed to me to call for my special study. Six turn on the characters of the Interpretant and three on the characters of the Object. Thus the division into Icons, Indices, and Symbols depends upon the different possible relations of a Sign to its Dynamical Object." Only one division is concerned with the nature of the Sign itself, and to this he proceeds as follows: –

> "A common mode of estimating the amount of matter in a MS. or printed book is to count the number of words. There will ordinarily be about twenty 'thes' on a page, and, of course, they count as twenty words. In another sense of the word 'word', however, there is but one word 'the' in the English language; and it is impossible that this word should lie visibly on a page, or be heard in any voice, for the reason that it is not a Single thing or Single event. It does not exist; it only determines things that do exist. Such a definitely significant Form, I propose to term a Type. A Single event which happens once and whose identity is limited to that one happening, or a Single Object of a thing which is in some single place at any one instant of time, such an event being significant only as occurring when and where it does, such as this or that word on a single line of a single page of a single copy of a book, I will venture to call a Token. An indefinite significant character such as the tone of voice, can neither be called a Type nor a Token. I propose to call a Sign a Tone. In order that a Type may be used, it has to be embodied in a Token which shall be a sign of the Type, and thereby of the object the Type signifies. I propose to call such a Token of a Type an Instance of the Type. Thus there may be twenty Instances of the Type 'the' on a page."

The special interest to Peirce of the distinctions thus christened was their application in explaining and developing a system of 'Existential Graphs', whereby diagrams are furnished "upon which to experiment, in the solution of the most difficult problems of logic." A diagram, he notes, "though it will

ordinarily have Symbolide features, is in the main an Icon of the forms of relations in the constitution of its Object." And in the same terminology it could be said that the footprint which Crusoe found in the sand "was an Index to him of some creature, while as a Symbol it called up the idea of a man." In the material here reproduced we are not concerned with the special applications which its author made of his theory, but in view of his constant insistence on the logical nature of his inquiry and his desire to avoid psychology, a further trichotomy[1] of general interest may here be mentioned. *Logic* he defined in an article in the *Monist* (Vol. VII., 1896–7, p. 25) as dealing with the problem, "to what conditions an assertion must conform in order that it may correspond to the 'reality'"; *Speculative Grammar* was the name given also by Duns Scotus to "the study of properties of beliefs which belong to them as beliefs"; and thirdly, "the study of those general conditions under which a problem presents itself for solution, and then under which one question leads on to another," appears as *Universal Rhetoric*. In writing to Lady Welby, he remarks that 'Significs', the term which she used for the study of Meaning, "would appear from its name to be that part of Semeiotic which inquires into the relation of Signs to the Interpretants (for which, as limited to Symbols, I proposed in 1867 the name Universal Rhetoric)." He strongly urges her to make a scientific study of Semeiotic, as well as of his Graphs ("I wish you would study my Existential Graphs; for in my opinion it quite wonderfully opens up the true nature and method of logical analysis – that is to say, of definition; though how it does so is not easy to make out, until I shall have written my exposition of that art"); and in a letter written in 1904, shortly before the publication of his chief *Monist* article, he deals with the classification of Signs at some length.

He prefaces his remarks by insisting that "a sign has *two Objects*, its object as it is represented and its object in itself. It has also *three Interpretants*, its interpretant as represented or meant to be understood, its interpretant as it is produced, and its interpretant in itself." Signs may be divided as to their own material nature, as to their relations to their objects, and as to their relations to their interpretants.

> "As it is in itself a sign is either of the nature of an appearance, when I call it a *qualisign*; or secondly, it is an individual object or event, when I may call it a *sinsign* (the syllable sin being the first syllable of Semel, simul, singular, etc.); or thirdly, it is of the nature of a general type, which I call a *legisign*. As we use the term 'word' in most cases, saying that 'the' is one 'word' and 'an' is a second 'word', 'word' is a legisign. But when we

[1] "They seem all to be trichotomies which form an attribute to the essentially triadic nature of the sign."

> say of a page in a book that it has 250 'words' upon it, of which twenty are 'the's', the 'word' is a sinsign. A sinsign so embodying a legisign, I term a *replica* of the legisign. The difference between a legisign and a qualisign, neither of which is an individual thing, is that a legisign has a definite identity, though usually admitting a great variety of appearances. Thus &, *and*, and the sound are all one word. The qualisign, on the other hand, has no identity. It is the mere quality of an appearance, and is not exactly the same throughout a second. Instead of identity it has great similarity, and cannot differ much without being called quite a different qualisign."

With regard to the other main divisions of signs he explains that "in respect to their relations to their dynamic objects, I divide signs into *Icons*, *Indices* and *Symbols* (a division I gave in 1867). I define an *Icon* as a sign which is determined by its dynamic object by virtue of its own internal nature. Such is any qualisign like a vision, or the sentiment excited by a piece of music considered as representing what the composer intended. Such may be a sinsign like an individual diagram; say a curve of the distribution of errors. I define an *Index* as a sign determined by its dynamic object by virtue of being in a real relation to it. Such is a Proper Name (a legisign), such is the occurrence of a symptom of a disease (the symptom itself is a legisign, a general type of a different character. The occurrence in a particular case is a sinsign). I define a *Symbol* as a sign which is determined by its dynamic object only in the sense that it will be so interpreted. It thus depends either upon a convention, a habit[2] or a natural disposition of its interpretant or of the field of its interpretant (that of which the interpretant is a determination). Every symbol is necessarily a legisign; for it is inaccurate to call a replica of a legisign a symbol."

In respect of its immediate object a sign may either be a sign of quality, of an existent or of a law; while in regard to its relation to its signified interpretant, it is said to be either a *Rheme*, a *Dicent*, or an *Argument*. "This corresponds to the old division Term, Proposition, and Argument, modified so as to be applicable to signs generally. A Term is simply a class-name or Proper-name. I do not regard the common noun as an essentially necessary part of speech. Indeed, it is only fully developed as a separate part of speech in the Aryan languages and the Basque – possibly in some other out of the way tongues. In the Semitic languages it is generally in form a verbal affair, and usually is so in substance too. As well as I can make out, such it is in most languages. In my universal algebra of logic there is no common noun."

[2] In the (1906) *Monist* article we read "A symbol incorporates a habit, and is indispensable to the application of any intellectual habit at least." (p. 495.) And again: "Strictly pure symbols can signify only things familiar, and these only in so far as they are familiar."

A Rheme is defined as "a sign which is represented in its signified interpretant as if it were a character or mark (or as being so)." It is any sign that is neither true nor false, like most single words except 'yes' and 'no', which are almost peculiar to modern languages.

A Dicent is defined as "a sign represented in its signified interpretant as if it were in a real relation to its object (or as being so if it is asserted)." A proposition, he was careful to point out in the *Monist* (1905, p. 172), is for him not the German *Satz*, but "that which is related to any assertion, whether mental and self- addressed or outwardly expressed, just as any possibility is related to its actualisation." It is here defined as a dicent symbol.

> "A dicent is not an assertion, but a sign capable of being asserted. But an assertion is a dicent. According to my present view (I may see more light in future) the act of assertion is not a pure act of signification. It is an exhibition of the fact that one subjects oneself to the penalties visited on a liar if the proposition asserted is not true. An act of judgment is the self-recognition of a belief; and a belief consists in the deliberate acceptance of a proposition as a basis of conduct. But I think this position is open to doubt. It is simply a question of which view gives the simplest view of the nature of the proposition. Holding then that a Dicent does not assert, I naturally hold that the Argument need not be actually submitted or urged. I therefore define an Argument as a sign which is represented in its signified interpretant not as a Sign of that interpretant, the conclusion, but as if it were a Sign of the Interpretant, or perhaps as if it were a Sign of the state of the Universe to which it refers in which the premises are taken for granted."

A sign may appeal to its dynamic interpretant in three ways: –

1. An argument only may be submitted to its interpretant, as something the reasonableness of which will be acknowledged.
2. An argument or dicent may be urged upon the interpretant by an act of insistence.
3. Argument or dicent may be, and a rheme can only be, presented to the interpretant for contemplation.

> "Finally, in its relations to its immediate interpretant, I would divide signs into three classes, as follows :—
>
> 1. Those which are interpretable in thoughts or other signs of the same kind in infinite series.
> 2. Those which are interpretable in actual experiences.
> 3. Those which are interpretable in qualities of feelings or appearances.
>
> The conclusion is that there are ten principal classes of signs: – 1, Qualisigns; 2, Iconic Sinsigns; 3, Iconic Legisigns; 4, Vestiges or Rhematic

> Indexical Sinsigns; 5, Proper Names, or Rhematic Indexical Legisigns; 6, Rhematic Symbols; 7, Dicent signsigns (as a portrait with a legend); 8, Dicent Indexical Legisigns; 9, Propositions, or Dicent Symbols; 10, Arguments."

This treatment of the familiar logical distinction between Term, Proposition, and Argument is somewhat different from the account given in the Monist (1906) article, where it is explained that "the first two members have to be much widened," and where we are introduced to Semes, Phemes, and Delomes.

> "By a *Seme* I should mean anything which serves for any purpose as a substitute for an object of which it is, in some sense, a representative or Sign. The logical Term, which is a class-name is a Seme. Thus the term 'The Mortality of man' is a Seme. By a *Pheme* I mean a sign which is equivalent to a grammatical sentence, whether it be Interrogative, Imperative or Assertory. In any case, such a Sign is intended. to have some sort of compulsive effect on the Interpreter of it. As the third member of the triplet, I sometimes use the word *Delome* (pronounced deeloam, from ??????) though *Argument* would answer well enough. It is a sign which has the Form of tending to act upon the Interpreter through his own self-control, representing a process of change in thoughts or signs, as if to induce this change in the Interpreter."

A Graph, he says, is a Pheme, "and in my use hitherto, at least, a Proposition. An Argument is represented by a series of Graphs."

There follows a discussion of "the Percept, in the last analysis the immediate object of all knowledge and all thought."

> "This doctrine in no wise conflicts with Pragmaticism, which holds that the Immediate Interpretant of all thought proper is Conduct. Nothing is more indispensable to a sound epistemology than a crystal-clear discrimination between the object and the Interpretant of knowledge; very much as nothing is more indispensable to sound notions of geography than a crystal-clear discrimination between north latitude and south latitude; and the one discrimination is not more rudimentary than the other. That we are conscious of our Precepts is a theory which seems to me to be beyond dispute; but it is not a fact of Immediate Perception. A fact of Immediate Perception is not a Percept, nor any part of a Percept; a Percept is a Seme, while a. fact of Immediate Perception or rather the Perceptual Judgment of which such fact is the immediate Interpretant is a Pheme that is the direct Dynamical Interpretant of the Percept, and of which the Percept is the Dynamical Object, and is with some considerable difficulty (as the history of psychology shows) distinguished from the Immediate Object,

though the distinction is highly significant. But not to interrupt our train of thought, let us go on to note that while the Immediate Object of a Percept is excessively vague, yet natural thought makes up for that lack (as it almost amounts to) as follows: – A late Dynamical Interpretant of the whole complex of Percepts is the Seme of a Perpetual Universe that is represented in instinctive thought as determining the original Immediate Object of every Percept. Of course, I must be understood as talking not psychology, but the logic of mental operations. Subsequent Interpretants furnish new Semes of Universes resulting from various adjunctions to the Perceptual Universe. They are, however, all of them, Interpretants of Percepts.

Finally, and in particular, we get a Seme of that highest of all Universes which is regarded as the Object of every true Proposition, and which, if we name it all, we call by the somewhat misleading title of The Truth."

That said, let us go back and ask this question: How is it that the Percept, which is a Seme, has for its direct dynamical Interpretant the Perceptual Judgment, which is a Pheme? For that is not the usual way with Semes, certainly. All the examples that happen to occur to me at this moment of such action of Semes are instances of Percepts, though doubtless there are others. Since not all Percepts act with equal energy in this Way the instances may be none the less instructive for being Percepts. However, Reader, I beg you will think this matter out for yourself, and then you can see – I wish I could – whether your independently formed opinion does not fall with mine. My opinion is that a pure Perceptual Icon – and many really *great* psychologists have evidently thought that Perception is a passing of images before the mind's eye, much as if one were walking through a picture gallery, – could not have a Pheme for its direct Dynamical Interpretant. I desire, for more than one reason, to tell you why I think so, although that you should to-day appreciate my reasons seems to be out of the question. Still I wish you to understand me so far as to know that, mistaken though I be, I am not so sunk in intellectual night as to be dealing lightly with philosophic Truth when I aver that weighty reasons have moved me to the adoption of my opinion; and I am also anxious that it should be understood that those reasons have not been psychological at all, but purely logical. My reason, then, briefly stated and abridged, is that it would be *illogical* for a pure Icon to have a Pheme for its Interpretant, and I hold it to be impossible for thought not subject to self- control, as a Perceptual Judgment manifestly is not, to be illogical. I dare say this reason may excite your derision or disgust, or both; and if it does I think none the worse of your intelligence."

There is an interesting letter dated March 14, 1909, in which Lady Welby's own Triad of Interpretation is discussed. "I confess," he writes, " I had not

realised before reading your *Encyclopaedia Britannica* article, how fundamental your trichotomy of Sense, Meaning and Significance really is. It is not to be expected that concepts of such importance should get perfectly defined for a long time.... I now find that my division (of the three kinds of Interpretant) nearly coincides with yours, as it ought to do exactly, if both are correct. I am not in the least conscious of having been influenced by your book in setting my trichotomy." He does not believe that there was even an unconscious reminiscence, and consequently feels "some exultation in finding that my thought and yours nearly agree."

He proceeds to inquire how far there is agreement. "The greatest discrepancy appears to lie in my *Dynamical Interpretant* as compared with your 'Meaning'. If I understand the latter, it consists in the effect on the mind of the Interpreter that the utterer (whether vocally or by writing) of the sign intends to produce. My Dynamical Interpretant consists in direct effect actually produced by a Sign upon an Interpreter of it. They agree in being effects of the Sign upon an individual mind, I think, or upon a number of actual individual minds by independent action upon each. My *Final Interpretant* is, I believe, exactly the same as your Significance; namely, the effect the Sign *would* produce upon any mind upon which circumstances should permit it to work out its full effect. My *Immediate Interpretant* is, I think, very nearly, if not quite, the same as your 'Sense'; for I understand the former to be the total unanalysed effect that the Sign is calculated to produce; and I have been accustomed to identify this with the effect the sign first produces or may produce upon a mind, without any reflection upon it. I am not aware that you have ever attempted to define your term 'Sense', but I gather from reading over what you say that it is the first effect that a sign would have upon a mind well qualified to comprehend it. Since you say it is Sensal and has no Volitional element, I suppose it is of the nature of an 'impression'. It is thus, as far as I can see, exactly my Immediate Interpretant. You have selected words from vernacular speech to express your varieties, while I have avoided these and have manufactured terms suitable, as I think, to serve the uses of Science. I might describe my Immediate Interpretation as so much of the effect of a Sign as would enable a person to say whether or not the Sign was applicable to anything concerning which that person had sufficient acquaintance."

As regards Meaning and Intention, he continues: "My Interpretant with its three kinds is supposed by me to be something essentially adding to anything that acts as a Sign. Now natural Signs and symptoms have no utterer; and consequently have no Meaning, if Meaning be defined as the intention of the utterer. I do not allow myself to speak of the 'purposes of the Almighty', since whatever He might desire is done. Intention seems to me, though I may be mistaken, an interval of time between the desire and the laying of the train by which the desire is to be brought about. But it seems

to me that desire can only belong to a finite creature." And he sums up as follows: –

> "Your ideas of *Sense*, *Meaning*, and *Signification* seem to me to have been obtained through a prodigious sensitiveness of Perception that I cannot rival; while my three grades of Interpretant were worked out by reasoning from the definition of a Sign what sort of thing *ought* to be noticeable and *then* searching for its appearance. My *Immediate Interpretant* is implied in the fact that each Sign must have its own peculiar Interpretability before it gets any Interpreter. My *Dynamical Interpretant* is that which is experienced in each act of Interpretation and is different from that of any other; and the *Final Interpretant* is the one Interpretative result to which every Interpreter is destined to come, if the Sign is sufficiently considered. The Immediate Interpretant is an abstraction, consisting in a possibility; the Dynamical Interpretant is a single actual event; the Final Interpretant is that toward which the actual tends."

Peirce's conception of an 'Interpretant' receives further elucidation in a letter written at the end of 1908, from which we have already quoted. He there emphasises that in all questions of interpretation it is indispensable to start with an accurate and broad analysis of the nature of a sign. "I define a Sign as anything which is so determined by something else, called its Object, and so determines an effect upon a person, which effect I call its Interpretant, that the latter is thereby mediately determined by the former. My insertion of 'upon a person' is a sop to Cerberus, because I despair of making my own broader conception understood. I recognise three Universes which are distinguished by three Modalities of being. One of these Universes embraces whatever has its Being in itself alone, except that whatever is in this Universe must be present to one consciousness, or be capable of being so present to its entire Being." The objects of this Universe he called Ideas or Possibles, the objects the second or actual Universe being Facts, and of the third Necessitants.

The Mode of Being of signs can be 'possible' (*e.g.*, a hexagon circumscribed in or about a conic); or 'actual' (as with a barometer); or 'necessitant' (as the word 'the', or any other in the dictionary). A 'possible sign he calls, as in the *Monist* article, a *Tone* ("though I am considering replacing this by 'Mark'"); an 'actual' sign, a *Token*; a 'necessitant' sign a *Type*.

> "It is usual and proper to distinguish two Objects of a Sign, the Mediate without, and the Immediate within the Sign. Its Interpretant is all that the sign conveys; acquaintance with its Object must be gained by collateral experience. The Mediate Object is the Object outside the Sign; I call it the *Dynamoid Object*. The Sign must indicate it by a hint; and this hint, or its substance, is the *Immediate Object*."

When the Dynamoid object is 'possible', the sign will be *Abstractive* (as the word Beauty), when it is actual the sign will be *Concretive* (anyone's barometer or a written narrative of any series of events); and thirdly, "for a sign whose Dynamoid Object is a Necessitant, I have at present no better designation than a '*Collective*', which is not quite so bad a name as it sounds to be until one studies the matter; but for a person like me, who thinks in quite a different system of symbols to words, it is awkward and often puzzling to translate one's thought into words! If the Immediate Object is a 'Possible' (that is, if the Dynamoid Object is indicated, always more or less vaguely, by means of its Qualities, etc.) I call the Sign a *Descriptive*; if the Immediate is an Occurrence, I call the Sign a *Designative*, and if the Immediate Object is a Necessitant, I call the Sign a *Copulant*; for in that case the Object has to be so identified by the Interpreter that the Sign may represent a necessitation."

A Possible can determine nothing but a Possible, and a Necessitant can be determined by nothing but a Necessitant. "Hence," he continues, "it follows from the definition of a Sign that since the Dynamoid Object determines the Immediate object,

which determines the Sign itself,
which determines the Destinate Interpretant,
which determines the Effective Interpretant,
which determines the Explicit Interpretant,

the six trichotomies, instead of determining 729 classes of signs, as they would if they were independent, only yield 28 classes; as I strongly opine (not to say almost approve) there are four other trichotomies of signs of the same order of importance, instead of making 59,049 classes, these will only come to 66. The additional 4 trichotomies are undoubtedly first *Icons* (or Simulacra), *Indices*, *Symbols*, and then three referring to the Interpretants. One of these I am pretty confident is: *Suggestives*, *Imperatives*, *Indicatives*, where the Imperatives include Interrogatives. Of the other two I think that one must be into Signs assuring their Interpretants by *Instinct*, *Experience*, and *Form*. The other I suppose to be what (in the Monist (1906) article) I called *Semes*, *Phemes*, and *Delomes*."

PEIRCE'S PLACE IN AMERICAN PHILOSOPHY

John Henry Muirhead. "Peirce's Place in American Philosophy." *Philosophical Review* 37.5 (September 1928): 460–481.

I

When the history of American philosophy in the 19th century comes to be written in greater detail than hitherto, the important place of Charles S. Peirce as a pathfinder in every one of the many fields that his work touched will have to receive fuller recognition than has as yet been accorded to it. His life covered the period which felt the influence first of the romantic idealism of the transcendentalists, then of the Hegelianism of W. T. Harris and the St. Louis group, later of the reconstructed idealism of which Royce was the chief representative, and finally of the more radical reactions against absolutism led by James and Mr. Dewey. With these movements Peirce was not only in intimate touch, but from one side or another in lively sympathy. It was for this reason that it was his fate, as it has been of few others and those only the greatest, to be claimed as a founder by different schools of thought. By writers in logic he has been assigned a leading place in the development of the logical realism associated in England most conspicuously with the name of Bertrand Russell. He himself claimed the title of a "critical common-sensist,"[1] reminding one both of the older naïver realism of the Scottish school and of the critical realism of Mr. Santayana and his friends. Readers of Royce's later works are familiar with the frequent allusions to his debt for some of their more original features to suggestions derived from Peirce's writings. Finally and more noisily, his connection with pragmatism, first as the inventor of the name and of the often repeated formula of its method, and secondly as the advocate of its favorite doctrine of the essential indeterminateness of nature and "cosmic weather," has been exploited in the interest of that form of philosophy. It is in this sense that he figures in Woodbridge Riley's brilliant sketch of *American Thought* as the representative of what he calls "primitive pragmatism" and that he has been claimed by Mr. Dewey in Professor

[1] *Monist*, Vol. XV, pp. 481 ff.

Cohen's volume of selected papers[2] as "in the literal sense of the word pragmatist, more of a pragmatist than James."[3]

While some may find in this many-sidedness an admirable feature marking Peirce out as the truly seminal writer that he was, and while Professor Cohen is within his right in contenting himself in his Introduction with drawing attention to it, others may find in it more of a challenge. Is it possible, they will be inclined to ask, that a writer imbued with the spirit of logic as he was, believing as he did in the ultimacy of what he calls "concrete reasonableness" in thought and practice, claiming as he constantly does that "Synechism" or faith in the essential continuity of things is the chief mark of his thought, should have left his own philosophy with so little internal coherence that like the empire of Alexander it fell at his death into a collection of warring satrapies? Is it not more likely that a closer study of his work in its origin and development as a whole will show it to have been governed by some central tendency that allied it more nearly with one or other of the great traditions of philosophic method and doctrine? This question is all the more pertinent seeing that in the essay already quoted, "The Pragmatism of Peirce," Professor Dewey ends his summary with the suggestive question "whether recourse to Peirce would not have a most beneficial influence on modern discussion." If Mr. Dewey's many admirers, of whom I confess myself one, are going to take this call of "Back to Peirce" with the seriousness with which he obviously issues it, it is a matter of the utmost importance to have a clear idea as to which of these many Peirces is the real one from whom to take our start. The present paper is a very imperfect attempt to set his thought in a truer perspective than seems to the writer hitherto to have been done, in the hope, which he shares with Dewey, of the beneficent effect that such an understanding may have on con temporary discussion. If it were to form the basis of a kind of Peace of Utrecht which might end the long and bitter war between Pragmatism and its enemies, whether of the idealistic or the realistic camp, it were a consummation devoutly to be hoped.

What I propose to do is *first* to give a short sketch of the development of his ideas as that may be gathered from the most accessible of his published articles with special reference to their bearing on Pragmatism, and *secondly*, setting aside in the light of this development the attempt to identify him with that form of doctrine as founded on misapprehension, to summarize the

[2] C. S. Pierce, Chance, Love, and Logic (1923), edited by Morris R. Cohen.

[3] *Cf.* what Professor Cohen says of him in his article on "Later Philosophy" in the *Cambridge History of American Literature*: "If philosophic eminence were measured not by the number of finished treaties of dignified length but by the extent to which a man brought forth new and fruitful ideas of radical importance Charles S. Peirce would easily be the greatest figure in American Philosophy."

main influences that seem to have molded his thought and as a matter of fact allied him with quite another tradition. If I omit altogether reference to his contributions to symbolic logic and touch only lightly on his theory of induction, it is not because I underestimate their importance, but partly because of my inability to do justice to them, partly because they seem to me and probably would have seemed to himself only of importance in so far as they threw light on his general philosophy. He himself reminded us of the priority of the more general problem when he wrote: "what sort of a conception we ought to have of the universe, how to think of the *ensemble* of things is a fundamental problem in the theory of reasoning."[4]

II

Peirce's chief published articles fall into three clearly marked groups: (1) Those which he contributed to the *Journal of Speculative Philosophy* in 1868 (the second year of its existence); (2) those which were published in the *Popular Science Monthly* ten years later in 1877–8; (3) those which after the interval of another decade appeared in the *Monist* of 1891–3; to which as a kind of aftermath may be added those which in the first decade of the present century he contributed to the *Monist*, Baldwin's *Dictionary of Philosophy*, the *Hibbert* and other journals.

1. The articles of the first of these groups possess a special interest for the student of American philosophy, not only because of the time and place of their appearance, but far more because of their contents. They were coincident with the new start that philosophy in America was just taking in the earnest first-hand study of German, and more particularly of Hegelian, Idealism, of which the *Journal* was the chosen organ. On the other hand, they seem to have been quite independent of that movement for their inspiration and are more truly regarded as representing an independent spring of fresh constructive thought. It was not only that, as was to be expected from one who as he himself tells us had been bred in the laboratory, Peirce approached philosophy from an entirely different angle from that of the St. Louis idealists, but that in so far as he connected himself with the European tradition he went to the great medieval thinkers rather than either to Plato or Hegel. As if further to mark the independence of his starting point he takes his bearings from a criticism of Descartes, the real "father," as he called him, "of modern philosophy," rather than from a criticism of Kant. It is to the correction of the errors of Descartes as they affect both the nature of thought and the reality of the thinking self that the first two articles, on the subjects respectively of "Questions concerning certain faculties claimed for man" and "Some consequences of four incapacities," are directed.

[4] *Chance, Love and Logic*, p. 108.

The "faculties" he chiefly attacks in the former are that of the direct intuition of truth whether by external perception or by introspection; that of imageless or, as he would afterwards have expressed it, "signless" thinking; and that of conceiving of an unrecognizable absolute. With regard to the first of these he develops the doctrine which is the keynote of his whole theory of knowledge as consisting essentially in inference, conceived of as a continuous process in which it is a mere blunder of principle to ask for any first or last. Similarly in what he says of the second incapacity we have the germ of his later doctrine of signs. In a fuller account of Peirce's theory of knowledge, what he says about immediacy and inference with special reference to the question of the status of the sign would call for more detailed treatment.[5] For our present purpose it is to what he says of the last of these incapacities, and the consequences which in the second article he deduces from it, that the main philosophical interest attaches.

He has already convinced himself that upon Cartesian principles, involving as they did the separation not only of matter or the *res extensa* from the *res cogitans* but of the world of objects in general (including the mind itself) from the subject, "the very realities of things could never be known," and that any theory which contained the least vestige of these principles, including Kant's itself, was involved in the same condemnation. In this fundamental criticism he was at one with the Hegelians of St. Louis, but he had reached it by a path of his own and he connected it with a fresh interpretation (the result of a profound study) of the realism of St. Anselm and Duns Scotus rather than with Fichte and Hegel. He saw that his rejection of any immediate intuition of truth involved at once the rejection of the popular interpretation of the medieval doctrine. ("Any given piece of popular information about scholasticism," he held, "may be safely assumed to be wrong.") What Duns Scotus taught and what any true realism must teach was not the reality of universals before or side by side with particular things which might be the objects of intuition, but the existence of an as yet undetermined reality (a "vague," to use a later expression of Peirce's own) towards which the reason of man was on its way, however far short it may yet have fallen.

Here also we have the first sketch of a view of which his subsequent philosophy was only a fuller development. It rests on the distinction between the *ens* or reality which is relative to the limitations of our information and reasoning power, and the *ens* or reality to which full information and correct reasoning will bring us. Seeing that this fullness of knowledge is an ideal of the long future and one that is only conceivable in a society whose achieve-

[5] The same holds of the matter of the articles of the same date as those under review, especially that "On a New List of Categories," which were published in the *Proceedings of the American Academy of Arts and Sciences*.

ments are a corporate rather than an individual possession, it involves the belief in "a *Community* without definite limits and capable of an indefinite increase of knowledge." In this way "those two series of cognitions, the real and the unreal, consist of those which at a time sufficiently future the community will always continue to affirm and of those which under the same conditions will ever after be denied."

The doctrine here sketched on the basis of a criticism of Descartes is further developed in a careful article of about the same date in review of Fraser's edition of Berkeley, which appeared in the *North American Review* of 1871. As a criticism of Berkeley the article is interesting as the first clear statement, so far as I know, in American philosophy of the real place of Berkeley in the history of thought as "the half-way station between Locke and Hume." "The innocent Bishop generated Hume and as no one disputes that Hume gave rise to all modern philosophy of every kind, Berkeley ought to have a far more important place in the history of philosophy than has usually been assigned to him." There has recently been a reaction against the treatment of Berkeley's philosophy as a mere transition phase of the empiricism of Locke with a correspondent emphasis on the appeal to his doctrine of "divine causation." What is particularly interesting in Peirce's account is the connection he established between these two phases of the Bishop's thought as an example of the strange but not infrequent historical alliance between nominalism and Platonism. It is just his denial of reality to sensible things which drives Berkeley to seek for it in an otherwise unknowable cause of phenomena. But to assert the existence of such a cause adds nothing to our knowledge. All that we can mean is that there are regularities in events in relation to what we call a thing, which have to be taken into account beforehand in the conception of that thing. What as a matter of fact we assert when we speak of the reality of a thing is that there is a "general drift" of human thought which will lead to "one general agreement, one catholic consent," a consent which is not limited to men in this earthly life but extends "to the whole communion of minds to which we belong including some probably whose senses are very different from ours." By the object's independence of our thought is therefore meant not independence of all experience and thought. "It is a real which only exists by virtue of an act of thought knowing it, but that thought is not an arbitrary or accidental one, but one which will hold in the final opinion." This Peirce admits is phenomenalism of a sort, for it denies the reality of any unknown thing-in itself which is the cause of our sensations. But it is *not* the phenomenalism which makes the reality of a thing dependent on its being in consciousness. Its standard of the truth of an idea or of the reality of an object is not its presence to perception, as with Berkeley, but its coherence with the experience in general, which "does not depend at all on its being actually present to the mind all the time." On the other hand it *was* the phenomenalism of Kant if we recognize first that

Kant's "Copernican step was precisely the passage from the nominalistic to the realistic view of reality," and second that "It was the essence of his philosophy to regard the real object as determined by the mind: in short, as the normal product of mental action and not as the recognizable cause of it."

What is remarkable in all this is, in the first place, the sureness with which Peirce has arrived for himself at what is essential in the teaching of Kant as the doctrine that "the real object is determined by mind"; in the second place, the connection of this teaching with medieval realism interpreted not as the assertion of the independent existence of universals, but as the assertion of the existence of a conceptual interpretation of the particular thing as experienced here and now which would bring it into harmony with "the body of realities"; and thirdly the decisiveness with which he identifies himself with this form of realism and thus finds his own teaching explicitly with the great medieval tradition of which Duns Scotus was the founder. In the general conclusions to which he had thus been brought he was undoubtedly influenced by his reading of Kant, but going along with this there was the antipathy which the mathematician in him felt to a doctrine that excluded from reality everything of which an image could not be formed and which closed the door on negative quantities and infinitesimals. By such an application of Ockham's razor he admitted that mathematics would be simplified, but it would be "simplified by never advancing to the more difficult matters." To the last with Peirce the decisive factor in the condemnation of all forms of minimalism, including pragmatism, was the denial which they seemed to him to involve of infinitesimals and therewith of the reality of the whole modern science of mathematics.

The second article closes with a criticism of the Cartesian view of consciousness and personality. Peirce accused himself twenty years later[6] of being still at this time too much under the influence of nominalistic views, but in the interpretation of consciousness as having its being not in an unknown substance behind its manifestations, but in the continuity of the process by which the mind passes by aid of the sign (the only immediately given whether it be a word, an image, an action or a mere feeling) from one meaning to another, he indicates sufficiently what he has in view. While it is true that "the phenomenal manifestation of a substance *is* the substance," yet the whole reality is never given in such manifestations. To know our minds as they really are, is, like all other true knowledge, something for which we have to wait upon the future. "Thought is what it is only by virtue of its addressing a future thought," which is only a more developed form of itself. He ends by quoting *Measure for Measure*:

[6] See *Monist*, July, 1892, p. 203.

"proud man
Most ignorant of what he's most assured
His glassy essence,"

a phrase which was to be the title of a later important essay.

2. Any reader approaching the second group of articles mentioned at the outset, ought to have been put on his guard against any interpretation of it that should seem to contradict the clear tenor of the first. There was the less excuse for any such misunderstanding seeing that the first article of this group is devoted to the clearest possible restatement of the results of the earlier group. Nominally concerned with "scientific method," these six articles, like all that Peirce ever wrote, have in view the results which emerge for our conception of the universe as a whole. What they do for us is merely to carry the neo-Kantism sketched above to a further stage of its development.

The first article is concerned with the test of truth and is a particularly vigorous restatement of the hypothesis which underlies all scientific investigation, viz. that "There are real things whose characters are entirely independent of our opinions about them." Different as our sensations may be, corresponding to the difference of our relation to the object, yet "by taking advantage of the laws of perception we can ascertain how things really are and any man, if he have sufficient experience and reason enough about it, will be led to the one true conclusion."

If we enquire into the ultimate ground of this faith, it is to be found not in its pragmatic success in the settlement of differences of opinion but in the dissatisfaction to which contradictory propositions invariably give rise – a dissatisfaction having its source in turn *not* in the doubt that there is a reality (Peirce acutely remarks that if this were doubted contradiction could not be a source of dissatisfaction) but just in the conviction of its existence. The article ends (as though in view of future alogistic interpretations of it) in an eloquent assertion of the supremacy of logic. "The genius of a man's logical method should be loved and reverenced as his bride whom he has chosen from all the world. She is the one that he has chosen and he knows that he was right in making that choice."

It is in the second article, as everyone knows, that the passage occurs which was claimed by William James in his celebrated California lecture as that in which the standard of Pragmatism was first raised.[7] It would have been odd if it really had been so after all that had gone before and in view of all

[7] It is hardly necessary to quote Peirce's words: After insisting that "our idea of anything is our idea of its sensible effects" he concludes: "It appears then that the rule for attaining the third grade of clearness of apprehension is as follows: Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then our conception of these effects is the whole of our conception of the object."

that was to come after. As a matter of fact the passage occurs in a paper not on the standard of the truth, but on the standard of the lucidity of concepts. It sets forth maxims for the clarification, not for the verification of ideas. It is certainly true that Peirce was at this time not himself wholly clear as to the importance of this distinction; and there are other unfortunate ambiguities in the article, chiefly as to the meaning and the scope he assigns to "active" and "practical" and again to "sensible effects." There is surely a certain irony in the fact that a passage which is concerned just with the question of clearness should have left crucial ideas in a state of obscurity when a word or two of definition in the despised formal sense of *genus* and *differentia* would have supplied precisely what was required. With regard to the meaning of activity, what ever doubt might remain was finally set aside by the wholesale repudiation in later statements of the doctrine of pragmatism as commonly understood. "To say that we live for the sake of action," he writes in 1905, "would be to say that there is no such thing as rational purport." Still more decisively in the article on Pragmatism in Baldwin's *Dictionary of Philosophy*, he repudiates the doctrine that the end of man is action as "a stoical maxim which to the present writer at sixty does not commend itself so forcibly as it did at thirty." As though to take the last stick of support from his traducers, he ends by proposing to his readers, as the means for attaining the highest grade of clearness, that they should remember "that the only ultimate good is to further the development of concrete reasonableness."

It is on the ground of the appeal to sensible effects in the passage before us that, as we have already seen, Dewey claims that "Peirce is more of a pragmatist than James." It is all the more important to recall that here also he sought later to set himself right by a whole-hearted disclaimer of sensationalism. "Modern psychologists," he writes to Mrs. Ladd-Franklin[8] "are so soaked with sensationalism that they cannot understand anything that does not mean that. How can I, to whom nothing seems so thoroughly real as generals and who regard Truth and Justice as *literally* the most powerful powers in the world, expect to be understood by the thorough-going Wundtian? The curious thing is to see absolute idealists tainted with this disease, or men who like John Dewey hover between Absolute Idealism and Sensationalism."

While there is no justification for attributing to Peirce even at this time anything at all resembling Pragmatism as understood by James and Dewey, the articles before us are important as containing the first clear statement of what (as distinguished from this) he himself called Pragmaticism, a name which, as he fondly hoped, "would prove ugly enough to rescue it from the hands of kidnappers." Alexander Bain had already called attention to the

[8] *Journal of Philosophy*, Vol. 13.

practical aspect of belief as a habit of action. "Belief," he had announced, "is that which we act upon." Kant had insisted that the categories of thought are rules of action in the sense of rules for the guidance of thought. Peirce's originality consisted in generalising these suggestions. He frees Bain's doctrine from the nominalism of the sensational philosophy and from the narrowness with which Bain conceived of action; he frees Kant's from limitation to the categories and extends it to conception in general treated of as a form of habit or a preparedness of the mind to act in a particular way in the presence of the appropriate stimulus. The value, in his view, of this generalization was that it succeeded in coordinating thought with conduct as a form of control. "The theory of Pragmaticism was originally based," he writes in 1905, "as anyone will see who examines the papers of Nov. 1877 and Jan. 1878, upon a study of that experience of self-control which is common to all grown men and women, and it seems evident that to some extent at least it must always be so based." "The machinery of logical self-control works on the same plan as does moral self-control in multiform detail. The greatest difference perhaps is that the latter serves to inhibit mad puttings forth of energy while the former most characteristically insures us against the quandary of Buridan's ass. In moral life we are chiefly solicitous about our conduct and its inner springs and the approval of conscience, while in intellectual life there is a tendency to value existence as the vehicle of forms."[9]

Whatever is to be said of the assimilation of concepts to habits (and I suppose from the side of psychology there would be a great deal to be said), it is clear that Peirce has no intention of resolving logic into ethics. Logic has its own special interest, finely defined in this passage as "the value of existence as a vehicle of form," its own unlimited range "bounded solely by the limits of its own powers," its own decisive laws delivering us from the quandaries of Buridan's and other asses. What we here have is the first clear statement in American philosophy of the conational and purposive element in intellectual processes that was afterwards of such decisive importance. How far it influenced Royce in his philosophical development between the writing of the *Religious Aspect of Philosophy* and *The World and the Individual* is a matter of surmise, but when the latter appeared Peirce was not slow to recognize in it the central feature of his own doctrine. In the same letter that contains his repudiation of psychologism he concludes: "Royce's opinions as developed in his *World and Individualism* [sic][10] are extremely near mine. His insistence on the element of purpose in intellectual concepts is essentially the pragmatic position."

[9] *Monist*, Vol. XV, pp. 483–4 and 482 condensed.

[10] In a review of the second volume which appeared in *The Nation* Vol. 75, Peirce writes of it: "As the first serious attempt to apply to philosophical subjects the exactitude of thought that reigns in the mathematical sciences, Royce's *World and Individual* will stand

The article ends with a return to the distinction between the clearness and the veracity of ideas which in spite of ambiguities he has never wholly lost. "Ideas may be ever so clear without being true. How to make them so ... how to give birth to those vital and procreative ideas which multiply into a thousand forms and diffuse themselves everywhere, advancing civilization and making the dignity of man, is an art not yet reduced to rule but of the secret of which the history of science affords some hints." It was to developing these hints that his own logical articles here and elsewhere were devoted.

What further concerns us in the present group is not their contributions to logic, considerable as these are, but the speculation in that upon "The Order of Nature" on the source of the universality and harmony with reality of our ideas of time, space, and force. He is aware of the suggestion that this is the result of natural selection "acting in favor of more and more correct ideas of these matters." But he only mentions it to put it aside on the ground that "it does not seem to account for the extraordinary accuracy with which these conceptions apply to the phenomena of nature." He adds: "it is probable that there is some secret here which remains to be discovered." He came himself to believe that it could only be explained on the ground of some such fundamental identity between the laws of thought and the laws of being as that which formed the main tenet of Royce's idealism.

3. Up to this point in the development of his general philosophy Peirce had been mainly occupied with epistemological questions and been chiefly influenced by antagonism to Cartesian ideas. But the time into which he had been born had other problems of a wider and more immediately pressing kind to occupy it. The advance of physical science and more recently of biology, which seemed to bring not only animal but human life itself under quasi-physical law, had raised in a new and acute form the age-old question of the relation of man to nature and the possibility of vindicating his essential freedom and therewith the ideas on which (however imperfectly they as yet governed practice) the civilization of Christendom rested.

There were two ways in which this vindication might be attempted. It might take the form of insisting on 'determination' of some sort as fundamental concept, – equivalent to the rationality of our world and therefore indispensable if we are to have any philosophy of it at all, – while at the same time recognizing the necessity of distinguishing between different forms of determination according to the level of being that had been assumed – in organic, organic, animal, or mental. It was this line that the Ger man idealism, with

a prominent milestone upon the highway of philosophy." Where he still feels himself unable entirely to follow him is in the absolute idealism which consists in the denial of the distinction between being and being represented. "Royce," he writes, "is completely immersed in his absolute idealism. It is his element and there is total reflection at the surface."

which in the sixties and seventies both England and America were being inoculated, took. But Hegelian idealism was still imperfectly understood and it was easy enough to mistake its doctrine of the dialectic of history for merely another attack on spiritual freedom in the interest of a "block universe." Even though its spirituality could be vindicated, there was still the question of the relation of the material to the spiritual in the process of cosmological evolution. There remained the other method of a frontal attack on the dogma of the exactness and rigidity of the *soi-disant* laws of nature and on the whole idea of determination as a universal mode of the world's being.

In the uncertainty, which in the eighties was beginning to prevail, as to the ultimate constitution of the physical world and the laws it followed, there was much to tempt to this method of attack and it is not surprising that in these years both on the continent and in England there were writers who were endeavoring to counter the mechanical view of the world by proving the existence of an element of spontaneity in the physical world itself, only masked by the uniformities which science for her own purposes and by a method of selection had succeeded in establishing. It was in this spirit that Boutroux wrote of the *Contingency in the Laws of Nature*, that Poincaré identified gravitation with a statistical law of averages, that Bergson wrote on *Creative Evolution*, and James Ward spoke of a Contingency that was discoverable in the heart of nature.

It was unlikely that a mind so alert to newer influences as Peirce's should not share in this general movement or, on the other hand, that one so original should fail to give expression to it in his own way. By the nineties he had begun to regard it as the main requirement for the "architecture" of a theory that it should come to terms with the scientific conception of law which he held had "revolutionized the intellectual world." It is again all the more important to understand precisely the "Tychism" or theory of chance which he advocated in the *Monist* articles of 1891–3,[11] seeing that this is the other element in his philosophy which was taken by William James to lend support to Pragmatism.

While it is usually assumed that what requires explanation is the absence of uniformity in nature, Peirce held that, on the contrary, what requires explanation is precisely the presence of uniformity. While he saw no way of explaining diversity on the basis of a presupposed determinate similarity, he thought he saw his way to explaining determinate similarity on the basis of

[11] The first of these articles is on "The Architecture of Theories"; the second on "The Doctrine of Necessity"; the third on "The Law of Mind"; the fourth contains an ingenious speculation on cellular activity, under the title of "Man's Glassy Essence"; the fifth, the application of the whole to a reinterpretation of biological evolution, bears the title "Evolutionary Love."

an initial indeterminateness. If the inorganic world of matter were taken by itself, it might be difficult to find instances of the precipitation of uniform from diversity, but the mistake was to take it by itself. Bring in life and mind and we can see that it is one of their most universal features that they tend to generalize themselves by the formation of what we call habits. Starting with an initial spontaneity they tend to settle down into uniformities that economize effort and regulate future action. Instead, therefore, of mind with its apparent spontaneity being the offshoot of matter and its fixities, why should not matter be conceived of as the precipitate of mind? Schelling had already conceived of nature as unawakened mind. Peirce would correct this by conceiving of it as partially "effete mind" and as therefore containing the possibility of a renewal of the spontaneity in which it had had its origin. He even suggests that (as Poincaré and others had maintained) the so-called laws of matter are merely statistical uniformities telling us nothing of the mode of action of the ultimate elements. A difficulty might be caused by the axioms of geometry and the propositions founded upon them, which mathematics and, following mathematics with its usual ape-like fidelity, metaphysics have taken to be precise and universal. But recent advances in mathematics he held had shown that there is no reason for supposing that what had hitherto been claimed to be axiomatic truths, *e.g.*, that the three angles of a triangle = 180°, are precisely true. Seeing then, as he also held, that metaphysical axioms are imitations of the geometrical axioms, "now that the latter have been thrown overboard, without doubt the former will be sent after them." Peirce sums up the view of the universe which thus emerges in the words: "Like some of the most ancient and some of the most recent speculations it would be a cosmogony philosophy: it would suppose that in the beginning – infinitely remote – there was a chaos of impersonalized feeling which being without connection or regularity would properly be without existence. This feeling sporting here and there in pure arbitrariness would have started the germ of a generalizing tendency. Its other sportings would be evanescent but this would have a growing virtue. Thus, the tendency to habit would be started and from this, with the other principles of evolution, all the regularities of the universe would be evolved. At any time, however, an element of pure chance survives and will remain until the world becomes an absolutely perfect, rational and symmetrical system in which mind is at last crystallized in the infinitely remote distant feature."[12]

We are not here concerned with the truth of this theory. Its importance has been largely discounted by the direction which recent anti-materialistic thought has taken corresponding to the first of the two lines indicated above. Instead of trying to vindicate freedom by undermining the belief in the

[12] *Chance, Love and Logic*, p. 177.

validity in its own sphere of mechanical law, it insists on the necessity of recognizing different levels of existence each with its own kind of law as the subject matter of the different sciences.[13] We are concerned merely with what he meant by the doctrine and with the type of philosophy with which, as developed by him, it allies him.

As stated in this form there might seem to be a *prima facie* case for interpreting the doctrine in the sense of the pragmatic belief in open possibilities in nature, *lacunae* so to speak, in her laws.[14] But it is difficult to see how even so it could be of any "practical" significance. Nature to Peirce meant just the set habits into which the original feeling-stuff had fallen. Only as such a system of habits could nature be known. Only as such a system could it form a stable foundation for either thought or practice. If the end of all action, whether theoretical or practical, is, as he also held, that kind of harmony between our thoughts and the nature of things which he calls concrete reasonableness, "becoming governed by law, instinct with general ideas," nothing could be more impractical and self-defeating than to reckon on any remnant of caprice that an abstract metaphysic might find in things.

As a matter of fact, Peirce made no attempt to work out the theory consistently with itself. The *formation* of habit is itself described as the result of "a law of mind": law, in other words, is explained by the assumption of a previous law. Not less is habit dependent for its *efficacy* on the recurrence in nature of similar circumstances – in other words on pre-existing uniformities. Even the very existence of chance is conceived of by him as an imperfection in the universe which will in the end be eliminated in a world which by the crystallization of mind in it has "become an absolutely perfect rational and symmetrical system." If, moreover, this faith in an ultimate tendency to rational system is to have any warrant in the nature of things, it must be

[13] "Let us not," writes Gilbert Lewis as the summing up of his brilliant book on *The Anatomy of Science*, "be confused by the double sense in which we use words like 'physics' and 'biology'. We may well suspect that the subject matter of physics and the subject matter of biology constitute a single continuum but the *sciences* of physics and biology comprise postulates and laws which no more need to be compatible with one another than do the geometries of Euclid and Lobachevski. The science of physics rests upon the postulate of determinism; the science of biology, unless it is to ignore deliberately the phenomenon of behavior, must abandon this postulate and substitute therefore a postulate of choice or freedom. As we continue the great adventure of scientific exploration our models must often be recast. New laws and postulates will be required while those that we already have must be broadened and extended and generalized in ways we are now hardly able to surmise."

[14] Peirce himself tells us that both the name and the doctrine of pragmatism were connected in their origin with Chauncey Wright's "Cosmic Weather." See *Chance, Love and Logic*, p. xix note.

founded on the presence in the feeling-substance itself of some deeper law of inherent *nisus* towards that consummation. To explain wherein such a law can consist is precisely the object of the last essay of this group, on "Evolutionary Love."

This essay is perhaps of all his published papers the one that is most characteristic of his many-sided and essentially human personality. The prophetic insight of some passages in it comes home to us with special force today. The question of the determining factor in evolution was not one on which biology had the last word. Darwinism had been pressed into the service of what he considered a particularly devastating social theory. The struggle for existence working on a basis of chance variations, when transferred to society, meant laissez-faire and a policy of Gradgrind. Peirce saw in this only ruin to the social order. "The Gradgrind banner," he declares in a prophetic passage, "has been this century long flaunting in the face of heaven with an insolence to provoke the very skies to growl and rumble. Soon a flash and quick peal will shake economists quite out of their complacency, too late. The twentieth century in its latter half shall surely see the deluge-tempest burst upon the social order – to clear upon a world as deep in ruin as that freed – philosophy has long plunged it into guilt, no post-Thermidorian high jinks then."

He gave the existing system too long a rope. A shorter, as we now know, was sufficient wherewith to hang itself. But he knew what he was speaking of and there seemed to him no higher mission for philosophy than to cut away the props that it derived from a false interpretation of the law of progress. For this purpose he tries to show that, while Darwin appeals to chance variations, and Weismann to physical necessity, Lamarck was on truer lines than either in leaving room for a deeper law of inward striving after higher forms of being and growth by experience. The theory of "creative evolution" and the *élan vital* has since been made familiar to us by Bergson and others. The principle that underlies it, which Peirce calls "evolutionary love," has received too little attention. Perhaps not the least of the benefits that would accrue from recourse to him would be the redirection of attention to this deeper *élan*.

Returning to Tychism, what is made clear in this concluding paper is that it is intended to dispose of any purely necessitarian interpretation of evolution by the substitution for it of one that appeals not to chance and the absence of law but to the subordination both of necessity and chance to the higher law of love.

III

I have tried in what has preceded to trace the development of the general theory which Peirce, according to the phase of it which he is emphasizing, calls at one time Realism, at another Common-sensism, at another Schelling-

fashioned Idealism, but most commonly Pragmaticism. My object has been to bring out the difference between it and pragmatism as that doctrine has taken form and is today widely held in America. It remains to try to sum up its leading features by a reference to the main influences which seem to have entered into its formation.

1. Passing over what he says of his early inoculation with the bacilli of Transcendentalism and his own training in the laboratory, one of the earliest and perhaps the most fundamental of all these influences was that which, as we have seen, came to him from the study of medieval logic and particularly of Duns Scotus. From him he learned the meaning and place of the universal in the being of things, not as another kind of intuitable particular nor as a mere abstract notion that may form the content of a class name, but as the principle that is embodied in the particular and that gives it such individuality as it possesses – the principle that makes a tree a tree, a man a man 'for a' that'. Whether Peirce realized clearly the distinction between what his friend Josiah Royce, following Hegel, called the abstract universal (the common property in virtue of which names are given) and the concrete universal (the unity of principle that pervades the parts of any organic whole) – may be questioned, but that the universals in which he believes as "literally the most real and powerful powers in the world" were of the latter type there can, I think, be no doubt. Just such universals he conceived it to be the object of the form of induction he calls "hypothesis" to reach. It was on the subordination of all human action to such universal principles in practice that all true progress in his view depended. It was such subordination, finally, both in theory and practice, that he meant by "concrete reasonableness" and that he declared to be the chief end of man.

2. Equally certain, both from what he has himself told us of his intellectual development and from the whole tenor of his writings, was the influence of the study of Kant's *Critique of Pure Reason* – the text book, as it might be said, of the philosophically wise of his generation. From this he learned not, as pragmatism would have it, the subordination of all activity to practice and of logic to ethics, but first (what is a wholly different thing) the purposiveness of all activity whether practical, theoretic, or aesthetic. It was the general view founded on the recognition of this purposiveness that, to distinguish it from pragmatism, he called pragmaticism and that since his time has become, I suppose, (though not under that unkidnapable name) a commonplace of philosophy. In the second place, he learned from Kant the place of thought as the direction of intellectual and moral activity towards unity and organization in the "matter of experience." Not all experience was perception and thought. He complains of Hegel's resolution of it into thought and immediacy. There was feeling and there was will. Nevertheless experience through which there does not run a thread of thought like a strain of music through notes (the metaphor is his), is a mere confusion and no true

experience of anything. The third thing he learned from his study of Kant was the impossibility of combining the belief in an unintelligible thing-in-itself with the real teaching of the *Critique*. The place of the thing-in-itself had been taken once for all by the thing at the determination of which we arrive when the process, as just described, has been brought to completeness in an exhaustive and harmonious experience. This for us must remain an ideal; but its existence *as an ideal* witnesses to our belief in a community of minds or in a common mind (Peirce believes that the one implies the other) in which it will one day be realized. This was the furthest he was willing to go in the attempt to prove the existence of a universal mind, to which all truth was already present. He thought Royce's attempt to take this further step well worthy of consideration.[15] But he himself could see his way no farther than to an appeal to the harmony which the belief in it brings into life both from the side of theory and practice. Like Coleridge he did not believe that the being of God was demonstrable in any strict sense of the word, but like Coleridge he was ready to say "assume it and all becomes clear."

3. The third of the influences in the light of which his work must be understood, was that which came from mathematics and the study of the logic of mathematics, in which he was one of the recognized leaders. If this had been the sole factor in his philosophical development, or even if it had been a more decisive one than it really was, there might have been a better case for allying him with Pragmatism. The Italian logician, Vailati,[16] in the same number of the *Monist* in which Peirce's "Prolegomena to an apology for Pragmaticism" appeared wrote on the connection between "Pragmatism and Mathematical Logic,"[17] emphasizing this alliance. As a matter of fact, in the autobiographical passage already quoted all that he claims for his mathematical conceptions is that they modified the "Schelling-fashioned idealism" with which he had previously been inoculated and which ended by coming to the surface. Whatever might be the points of alliance between pragmatism and

[15] See his review of the *World and the Individual*, Vol. II, *Nation*, Vol. 75, No. 1935

[16] *Monist*, Vol. XVI. The writer draws out six points of agreement between Pragmatism and Mathematical Logic. Five of them – the denial of the ultimateness of the distinction between categorical and hypothetical propositions, the emphasis on the history of theories, the insufficiency of the classical conception of definition by *genus* and *differentia*, the nature and place of postulation in scientific method, the rule for testing the truth of hypotheses, and the stringent application of Ockbam's razor to scientific conceptions – may be said by that time to have been commonplaces of modern logic and owed little or nothing to pragmatism. The remaining one, "repugnance to the vague, indefinite or generic," was precisely what Peirce, as we have seen, would have disowned in the interest of the realism which was the fundamental note of his philosophy.

[17] See his criticism of Dewey's *Studies in Logical Theory* in *The Nation*, Vol. 79, No. 2046.

mathematical logic, they were all outweighed for Peirce by the unforgivable sin of a nominalism that meant denying the reality of infinitesimals in mathematics and importing into logic what he calls "the trivial language of practical life."[18]

4. The last of the influences that deserve mention (like all those that go deepest in a man's mental make-up), is difficult to describe. Peirce would probably have rejected the description of it as Christianity. Perhaps he would have been less unwilling to have it called the Platonic tradition which underlies the Christian theology. However described, it was the conviction in his mind of two things: *first* the underlying unity of human society, the reality of what idealists have called the general will, and *secondly* the underlying unity between the community of finite souls and the soul of the world. In respect to the first of these we may not be prepared to accept Peirce's mystical doctrine of the existence of a 'spirit' in a people or an age which achieves results "beyond the powers of unaided individuals,"[19] but the tenacity with which he held to it witnesses to the vividness with which he realized the dependence of individuals on the sustaining spirit of their corporate life. And with regard to the second, while, as we have seen, Peirce had little belief in the ordinary arguments for the existence of God, he yet held that "it would be folly to suppose that any metaphysical theory in regard to the mode of being of the perfect is to destroy the aspiration toward the perfect, which is the essence of religion. Am I to be prevented from joining in the common joy as the revelation of enlightened principles of religion which we celebrate at Easter and Christmas because I think that certain scientific, logical and metaphysical ideas which have been mixed up with these principles are untenable? To do so would be to estimate these errors as of more consequence than the truth."[20]

It would not be true to say that Peirce ever succeeded in bringing the ideas that came to him from these different sources into a consistent whole. But that like Coleridge again, with whom, both in his strength and in his weakness, we are often tempted to compare him, he felt the need of so doing, is abundantly plain.[21] Unlike Coleridge he was fortunate in having as friend a companion thinker whom he had himself profoundly influenced and with whose development of his own ideas he was in profound sympathy.

[21] After the summary of "the materials out of which chiefly a philosophical theory ought to be built" in the paper on the Architecture of Theories he prays "May some future student go over the ground again and have the leisure to give his results to the world."

What particular significance the philosophical alliance of Peirce and Royce has for the future of American philosophy lies beyond the scope of the present paper. What I have tried to bring out is the line in which the true affinities of the work of the elder of these thinkers are to be sought and the kind of benefit that might accrue to contemporary discussion from the "recourse to Peirce" to which Mr. Dewey summons us. The line lies, I believe, in a return to the great central philosophical tradition which for lack of a better name we may call Platonic; the benefit will be (what perhaps is most needed at the present time, in America perhaps as much as elsewhere) a sense that some firm ground has been won here as elsewhere by the best of the thinking which distinguished the end of the nineteenth and the beginning of the twentieth century, from which assured progress may be made.

CONTINUITY, THE FORM OF FORMS, IN CHARLES PEIRCE

Charles Hartshorne. "Continuity, the Form of Forms, in Charles Peirce." *The Monist* 39.4 (October 1929): 521–534.

The philosophy of Charles Peirce is a vast intellectual cosmos, in its major outlines scarcely better known at the present time, than was the system of Aristotle in the late dark ages. The reason in both cases is the same – the non-publication, in available form, of the philosopher's principal writings. This lack in the present case is soon to be remedied, much more completely, happily, than in the Aristotelian parallel.

Anything like an exposition of so profoundly original and comprehensive a philosophy cannot here be attempted. What is offered in the following pages may be described as a variation on a Peircean theme suggested by prolonged study of the philosopher's published and unpublished writings.[1] This theme is indicated by the following quotations from unpublished sources: –

"In philosophy the language of continuity, without which no physical science could have come into being, is to this day a strange tongue." "Continuity is the word of all modern science." "Continuity, than which no conception yet discovered is higher." "Continuity is the *lucerna pedibus* in all the dark paths of logical and philosophical inquiry."

Again and again this note recurs in the writings of Peirce. Moreover, it is woven into the very title by which he summarized his philosophical position, namely, not pragmatism, nor tychism, but – "synechism," from the Greek word for "holding together" or "making continuous."

Nevertheless, it is necessary to emphasize that this conception, central as it is, forms but one of at least a trinity of major technical ideas, all of which would have to be considered in an exposition of Peirce's philosophy as a whole, and none of which can be fully appreciated apart from its integration with the others. Besides continuity, the two remaining doctrines are: the theory of categories (*One, Two, Three,* or: *Feeling, Reaction,* and *Significance*) and the theory of signs or logic (an aspect of which was *Pragmatism*).

[1] Although the principal sources of this article are unpublished, the following published writings of Peirce may be consulted: *Chance, Love, and Logic* (Ed. Morris Cohen), pp. 202–237, 259–300; articles in *The Monist*, Vol. XV, pp. 180 ff. and (on "Synechism" and "Pragmatism") in Baldwin's *Dictionary of Philosophy and Psychology*.

I assume, without argument, the following definition of philosophy: The descriptive science of the most general characters of experience, and the explanatory science of the total universe of actuality and possibility. The elucidation of the terms of this definition will exhibit the centrality of the conception of continuity for all philosophical inquiry.

1. *Description as comparison.* All descriptive science begins by comparison or classification, by positing relations of likeness and difference. There are two views of the logic of these relations. Red and orange are both alike and different, and the likeness, together with difference, involves, and seems almost to consist in, a continuous series of possible intermediaries between the two. Red and orange shade into one another. In the end, so do all colors, mediately or immediately. Here is one type of likeness-difference, one aspect at least of classification. Variation *may* at least have the mode of potential continuity (whether the intermediaries are all actual or not being a flatter for further consideration.) The question at once arises, has variation any other possible mode, such as would involve absolute discontinuity, the absolute impossibility of intermediate forms? The following grounds appear to leave us little choice but to deny such an alternative:

a) A difference exclusive of potential intermediaries would be a "difference of kind" only, and not "of degree." But the idea of separate kinds has a merely relative validity, is itself a matter of degree; ultimately there is but one kind of thing, namely, the kind of thing which in the broadest sense of the word is a thing, or is a something. Absolute plurality of genera, of beings, would destroy being as such, and all general categories. The old arguments of the monists from Parmenides down have an aspect of unrefuted validity. They are often ignored; they are never overthrown. Absolute discontinuity of being contradicts being, of quality contradicts quality, and so on through all general categories.

b) The impossibility of intermediate degrees of a difference is a merely negative character which no observation could directly or indirectly reveal. It could not be perceived, there could be no ground for inferring it. The possibility of intermediaries, on the other hand, can be observed to be fulfilled in certain cases, and it ought for the purposes of investigation to be postulated in all cases. Observation, it is true, can reveal that two things are very different, extremely different, or even that we are unable for the time being to find any resemblance between them. Black and yellow, for example, might impress us in this way, until the intermediary forms of brown were put before us. Can there be any proof that the appearance (so far as there is such an appearance) of absolute gaps between temperature sensations and colors, for example, is due to any other cause than the contingent fact that we have no organs for perceiving the intermediaries? That such organs would be possible is a reasonable and a fruitful hypothesis, as I hope elsewhere to show.

c) The hypothesis of intermediaries stimulates imaginative experiment and perceptual inquiry. It reveals the universe of potential forms as far richer than upon any other view; it refuses to accept the results of previous observation as furnishing a complete account either of what might be, or even, with respect to the hidden aspects of reality, of what is. The opposite hypothesis sets up limits which are without verifiable meaning, besides being logically self-contradictory.

The hypothesis of continuity is thus more than an hypothesis; it is a formally necessary, an empirically adequate, and a fruitful analysis of the meaning of comparison or classification. It is the definitive analysis of analysis.

d) In the history of philosophy, the continuity of forms is a conception that, in some approximate form, has haunted such minds as Heracleitus, Parmenides, Plato, Leibniz, Spinoza, Kant, Hegel, Cournot, and Peirce. In contemporary thinking there are signs of its emergence in many quarters. Its establishment would justify simultaneously the two great visions of the unity of being and of the relevance of mathematics to metaphysics – two of the most persistent of all philosophical convictions.

The relationships to Plato and to Kant deserve special consideration. Recent research has brought to light aspects of Plato's theory of "the ideas as numbers" which correspond strikingly with Peirce's similarly mathematical doctrine of the categories. (Yet the evidence does not favor the assumption that Peirce derived his views from the study of Plato.) Both doctrines culminate in the same conception of the graduated or relative character of distinctions between ideas and in other aspects expressed for Peirce by the term *continuous*. The principal differences are, perhaps, first, that the formal side of the theory is more clearly defined by Peirce – who has modern mathematics and mathematical logic to build on; and, second, that the side of concreteness, the relation of the ideas to experience as a whole (a relation mediated for both thinkers by the supreme idea of *good*) is, in the doctrine of pragmatism and other conceptions espoused by our American thinker, more unambiguously and adequately worked out.

Kant's appendix to the *Dialectic* contains an impressive exposition of the principle of *affinity* – "*non datur vacuum formarum*" – which is referred to by Peirce, and which, unlike the Platonic anticipations, almost certainly contributed not a little to the development of his doctrine. The exposition of Kant comes close to the essence of the matter (though not in *every* respect an advance over Plato's treatment); and if it falls short of the synechistic doctrine, this is partly because Kant fails to apply the principle to the ideas of philosophy as thoroughly as to those of natural science; partly, also, because he fails to note what his own exposition has none the less rendered so clear, namely, that his doctrine implies the centrality of a super-spatial geometry for all intellectual analysis; partly, finally, for still further reasons which may here be omitted.

2. *Science*. The definition of philosophy as a science suggests that we should consider what may be the logic of comparison employed by the recognized or "successful" sciences, such as physics. The logic of physics is conditioned by the conception of a four-dimension continuum. The potential continuum of forms which biology has substituted for the old logic of species can be looked upon, however inadequately, as a specialization of this presupposed physical continuity. The blending of space and time, of matter and energy, of law and freedom, in recent physics illustrates the breakdown in that science of most of its lingering pseudo-absolute discontinuities. The quantum which appear in conflict with this tendency, really illustrates it, for a quantum is an *actual* discontinuity, characterized in terms of a background of potential, though at present, in our world, perhaps unrealized, intermediaries. It destroys certain forms of absolute discontinuity, such as between energy and matter, but it establishes no new ones. The point may also be put in this form: the quantum is a finite, hence a *relative*, discontinuity; it has a measurable quantity, as its name implies; an infinity of different quantities would therefore have been logically (mathematically) possible, and the series of these possible quanta is continuous.

3. *Generality*. Philosophy, like any science, deals with general characters or universals. The problem of the universal has been central in philosophy for two thousand years, but the definition of the universal as a continuum of possibilities, a view first proposed by Kant and developed by Peirce, seems without a rival as an analysis of the *formal* characteristics of the universal. That some universals imply continua is clear; inductive inquiry shows, furthermore, that all universals which seem not to be of this character are such as lack clear and intelligible meaning unless such continua are posited for them. These universals are all extra-scientific, more or less metaphysical notions, such a "reality," "essence," "experience," and the like. The technical universals of the sciences, on the contrary, and most of those of everyday life, are clearly of the continuity type. Examples: triangle, dog, goodness, humanity – all positing ideal continua of forms.

The most comprehensive or philosophical universals are then the chief, if not the sole, examples of apparently non-continuous universals, but they are the very ones whose meanings and logical status are most obscure. The remedy for this obscurity is to see in such universals references to an *all-comprehensive* continuum of possibilities, of which the narrower universals represent limited portions. The realm of essences or possibilities is then to be regarded as a single n-dimensional continuum in the sense of pure, that is non-spatial, geometry.

4. *Possibility*. The power of the conception of continuity as an instrument of philosophical analysis depends further upon the definition of this conception (in agreement with Kant and some contemporary mathematicians) as a unity transcending all discrete multitude. If one defines the universal as

the continuum of its possible instances, this does not mean that it is the instances which as a multitude make up the continuum, for the latter is defined as a principle inexhaustibly generative of multitude rather than identical with any distinct multitude. It follows that possibilities or qualities apart from actualization do not subsist as a plurality of self-identical entities ("they have no identity"); there is no set or multitude, finite or infinite, of "eternal objects," but there is an eternal creative source of qualities such that, given any two actualized qualities, there is an inexhaustible possibility of intermediaries between them. This inexhaustible possibility of the intermediaries is their continuity (a "multitude beyond all multitude"). This view amounts to a mathematical analysis of the problem of essences and of universals which is neither nominalistic nor realistic in the usual senses. It is inseparable from a recognition of the objective significance of the ideas of vagueness, possibility, potentiality, creativity, free becoming. The future is new even from the standpoint of subsistence or of essence; in no sense whatever could its particularity be anticipated or necessitated by the present. There is here a precise formulation of the principle of *emergence*.

It must be admitted that the definition of continuity here employed is still today a matter of controversy among the mathematicians. The Peircean side of the question appears to be represented by the so-called intuitionists (such as Weyl and Brouwer). From this mathematical issue, however, we must here abstract – vital as it undoubtedly is for the philosophy of Peirce.

5. *Experience: The problem of the datum.* There is a crying scandal in philosophy. This is the paradox of an extreme diversity of opinion in regard to the immediately given as such (that is to say, apparently, in regard to the obvious in its very obviousness). This diversity of opinion is explained, and in principle overcome, by the application of continuity to the alleged heterogeneity of diverse classes of data, such as colors contrasted with sounds, qualities contrasted with affective tones, awareness contrasted with its contents, and other similar divisions. All of these distinctions can be proved by the mathematically necessary con sequences of observed facts to be relative only, relative that is, to a potential continuum of qualities. The dimensions of this continuum, as can likewise be demonstrated, are most clearly revealed in the case of data which are admittedly affective, aesthetic, and (above all) social, in character. In this way, certain old issues of "idealism," "realism," or "subjectivism," will be settled finally on the basis of observed facts and their mathematical forms. The datum will be *seen* to be mental because it will be seen to be affective, aesthetic, and social in essence, and by this last token of the social it will be seen also to be objective, directly to reveal an object, though an object itself of an equally mental or affective character. Realistic idealism as social animism or direct affective community will be established by the data themselves as the sole descriptively accurate account of experience. Such an account, though in very general outlines only, was prognosticated by

Peirce, and to the present writer at least it seems manifest that a more detailed development is possible and desirable. The result would be nothing less than the reduction of the chief philosophical issues to questions of the mathematical forms *perceptibly* embodied in immediate concrete facts.

6. *Explanation and contingency*. According to the old ideal (now abandoned in physics) explanation implied causal determinism. But the actual universe as a whole remained on this view totally inexplicable, since no cause could be conceived which would imply the universe as a necessary effect. The universe as, a whole is logically contingent with respect to the realm of possibility. Explanation in metaphysics cannot then be in terms of causal necessity. The alternative to necessity is chance. Chance, however, is merely negative unless construed as free choice, or creative fiat. The actual is explicable as the progressive creation by fiat of logically contingent discontinuities out of that necessary continuum of possibilities whose being consists in the eternal unity of the creative power. This power may, according to Peirce, best be conceived through the admittedly vague conception or experience of God.

It will be seen that though synechism is a species of monism, this monism does not imply the "block universe." The future is contained in the present only as an indeterminate anticipation or potency, implicative of freedom and true novelty.

7. *The Universe*. The law of continuity is a formal principle, a principle of analysis, or a *regulative* principle. Its constitutive correlate in the concrete, its metaphysical basis and final meaning, which we have now to consider, is the principle of *social community*. As in Whitehead, the social concept on the side of concreteness, the concept of universal relativity on the side of logical structure, are the two chief clues to the nature of things. It is to be noted, however, that in neither thinker does "social" refer exclusively to *human* society.

The universe is the synthesis of the possible and the actual. The actual, in turn, is that which can be reached solely through its dynamical contact with present experience. Not otherwise can it be defined. But this implies that all actuality is organically contained in the individual present experience. The resulting organic or dynamical relativity is continuity in its existential mode. According to this, even numerical difference, individual being, is a matter of degree, as may be illustrated by the phenomena of multiple personality, and in a thousand ways.

The following are some of the chief approaches to this existential aspect of our conception:

a) Space and time are relatively concrete modes of continuity. But the only adequate account of these concepts is one couched in essentially social terms. "My neighbor is he with whom I most intimately react," and this reaction is a matter of continuity, of mutual participation with respect to feelings, is a

spiritual or social affair. Similar remarks apply to *time*. Time is the form of freedom, limited by habit, memory, and that continuity of an ideal which is constitutive of personality. Time is sympathy (social continuity) of a creative present with a created or settled past and an uncreated, partially indeterminate future. The unity of time, moreover, according to an argument presented in Peirce's *Monist* article on the "Law of Mind," is a proof of the thesis of qualitative continuity expounded above. If the succession of qualities in time involved absolute gaps, the unity of time – so Peirce argues – would be destroyed.

b) Mind-body. The only possible solution of the mind-body problem is to be found in the view of matter as "habit-ridden" mind and in the conception of the interdependence of matter with matter, of matter with mind, of mind with mind, as a bond of sympathetic rapport, as social in nature. Thus consciousness involves, in the words of Peirce, "a sort of public spirit among the bodily cells."

c) The unconscious. If to be perceived is a matter of degree, namely of degrees of vagueness and clearness of perception, then two problems are resolved at one blow: the problems of the subconscious and of the immanence of the entire actual universe in present experience This immanence, the necessity for which has been shown above, is largely in the form of faint or vague perceptions. (Compare the similar doctrines of Whitehead and Leibniz.)

d) Ethics, aesthetics, and religion. In the experience of value, whether social, aesthetic, or religious, our fundamental intuitions demand unmistakably a doctrine of the continuity or fusion of self with object, self with neighbor, self with the universe. "Losing oneself" (relatively yet genuinely) in the other is according to Peirce a literal truth of all the basic exaltations and obligations.

The essence of reason – generality – the essence of emotional life – sympathy – are thus seen to coincide formally in the element of continuity. The law of thought springs from a kindred law of life, the structure of intellect from the organic and social unity of feeling and purpose.

e) Evolution. The explanation of diverse entities in terms of a common origin is possible only if the diversity of the elements is relative, or in accordance with the logic of continuous variation. The theory of sports or mutations does not conflict with this, any more than the quantum theory, and for the same reason, the discontinuity referring in both cases to the actualization of forms, not to their possibility. *All* actuality involves arbitrary discontinuities limiting the pure continuum of the possible.

By considering all classes whatever from the standpoint of continuity, Peirce is enabled to carry the evolutionary theory radically further than other thinkers had done. Even laws, he held, are evolutionary products. So are the sensuous qualities which form the contents of experience. These two conceptions, of the evolution of feelings, and the evolution of laws as habits of

feelings, are surely among the grandest speculations of evolutionary philosophy.

In conclusion, the "law of continuity" seems worthy to be characterized as the most scientific result which metaphysics has yet attained. It unites unparalleled precision, great cogency, and absolute universality of relevance. There is, it seems to me, simply no problem of philosophy which does not demand for its clear formulation what Peirce called the language of continuity. All the more general technical issues of the past are superseded by this central issue of the logic of classes and in dependent substances, on the one hand; and the logic of qualitative continuity and existential relativity, on the other hand. As the former, in its most tenable aspect, is merely an ill-defined special case or arbitrary limitation of the latter, and as the logic of modern science and – though less distinctly and consistently – of classical metaphysics) is one of continuity, the decision of the issue in this sense may reasonably be expected.

What would result from the general acceptance of this program? "Were I to attempt to expound," Peirce has said, "the beauties of the idea of continuity, I must say, in the language of Matilda, that the tomb would close over me ere the topic were exhausted." The tomb has closed over the author of these words, but let us suppose that continuity, the word of all modern science, and, unconsciously, of the great metaphysicians, should become the word also of all future philosophy; let us suppose furthermore that to this insight should be added that other Peircean doctrine that in the formulation of *concepts*, that is, of publicly controllable meanings, the crucial continuities are those of purpose and behavior, would not such a pragmatism form the basis of a new intellectual civilization? For continuity is a conception of geometry; the "law of continuity" therefore means that the formal structure of concepts is identical with the subject-matter of pure geometry, *is* geometry. An element of unhoped for rigor and precision thus comes to the aid of the otherwise all too vague and flexible conceptions of behavior and social purposiveness, whose concreteness on the other hand admirably supplements the sheer emptiness, taken by themselves, of the geometrical forms. That a metaphysics or cosmology can be developed on such a foundation has been indicated. The relevance of such conceptions to the problems of life and value may likewise be inferred.

Yet two points may be mentioned specifically: the practical importance of the maxim that every real question is to be treated as a question of degree and not of some absolute principle opposed to its opposite; and the advantages for ethics of a scientific demonstration of the completely social character of all existence, and hence of the fundamental purposes of life. As for the effect upon psychology, that key science of the future, its entire working logic – at present open to such bitter attack – would be transformed, and the problems of sensation, attention, abstraction, will, aesthetic feeling, and the

rest, would be seen in a new light inviting and facilitating experimental verification and control.

Yet even so, one would not have exhausted the resources of the philosophy of Peirce. He was a technical innovator such as had not been seen for more than half a century – in a certain sense, even, such as had not thitherto been seen. Philosopher-scientists there have been doubtless – a few supreme intellects – with greater inborn capacity than need be supposed in the case of Peirce. But, if one considers the incomparable superiority of the science of his day over that of all preceding ages, and adds to this his immense range – unique among his contemporaries – of technical training and achievement, one will, I am persuaded, find himself driven to conclude that so much strictly scientific knowledge and power, together with so much philosophical learning and originality, had never, perhaps have never, been united in one human brain.

CHARLES PEIRCE'S GUESSES AT THE RIDDLE

Ernest Nagel. "Charles Peirce's Guesses at the Riddle." *Journal of Philosophy* 30.14 (6 July 1933): 365–386, 31.7 (29 March 1934): 188–190, 31.21 (11 October 1934): 582–583, 33.4 (13 February 1936): 107–109.

Collected Papers of Charles Sanders Peirce. Edited by Charles Hartshorne and Paul Weiss. Cambridge: Harvard University Press. Vol. I, 1931. Pp. xvi + 393. Vol. II, 1932. Pp. xii + 535.

With the publication of his *Collected Papers* by Harvard University a measure of justice is being done to Charles Peirce, long neglected except by a select few students. Unfortunately, the handsome volumes of this edition can not undo the damage which both Peirce and philosophy have suffered when he was not permitted, except for a brief period, to receive the intellectual and literary discipline which regular university teaching would have given him. His was an erratic temperament, as his writings amply testify. His conception of philosophy was architectonic, and he tried to write it in a grand manner; but most of the hitherto unpublished material which has appeared thus far is obscure, uneven in quality, and, in spite of the best efforts of his editors, unsystematic. As he himself remarked in 1903, "All that you can find in print of my work on logic are simply scattered outcroppings here and there of a rich vein which remains unpublished. Most of it I suppose has been written down; but no human being could ever put together the fragments. I could not myself do so." It is not surprising, therefore, that the writings in these first two volumes which are best from the point of view of clarity, consistency, and organization, are the articles published during his own lifetime.

Until all the ten volumes will have been published it is impossible to evaluate adequately even the first two. Their contents will suggest, to any one familiar with the literature of the last quarter-century, many of the central ideas of better-known writers. It is easy to find something of Husserl, Whitehead, Santayana, Wittgenstein and the logical positivists, Hilbert, Brouwer, and others, in the hints thrown out by Peirce, but left undeveloped. But whether these "anticipations" can legitimately be read *out* of Peirce, instead of read *into* him, only the later volumes will perhaps definitely decide. It is not impossible that he may become everything to all men, and that

rationalists and empiricists, naturalists and idealists, realists and nominalists, may all read him for support as well as stimulation. Peirce was often his own audience,[1] and he could afford to be voluminous, repetitious, sketchy, and obscurely subtle. But to others it is not always evident what value much of his analysis has for clarifying problems of philosophy or science. His reader gets an impression of someone packing and preparing for an important tour, but who somehow never crosses the gates of his own familiar city: we are shown the itinerary and given glowing promises of what is in store for us, but alas! too frequently the manuscript breaks off just before the train is scheduled to leave.

Not even a complete summary can be given, in brief compass, of the contents of these volumes. This review must confine itself to a statement of just three important themes, and the interested reader must be left to examine at first hand many of the interesting variations which Peirce embroiders upon them.

I

The Peirce who is familiar to readers of his published writings is usually the mathematical logician and student of scientific method. But his scientific interests seem to have been subordinate to a far-flung metaphysics, and the substantial part of Volume I is devoted to an analysis and a speculative use of the categories. He desired to draw up a list of fundamental categories such that for a long future the intellectual achievements of man would appear simply as corroborative details, and one of his earliest published papers was already concerned with this task. Unfortunately, Peirce had a fondness for trichotomous divisions, and so he recognized just three fundamental categories: Firstness, Secondness, and Thirdness. But Secondness is analyzable into two species, the second of which is again divisible into two species, and so on; while Thirdness is analyzable into three kinds, the second of which is divisible into two varieties, and so on, and the third of which is divisible into three varieties, etc. His thought appears in a very artificial form indeed, although he had enough sense of humor to see how crack-brained his triadic scheme must appear to the general reader (1.364).[2]

Peirce has not definitely stated what status he assigns to the categories. But they are frequently proposed as the directly apprehended logical simples into

[1] He supplied one manuscript with the following heading: "Notes for a Book, to be entitled 'A Guess at the Riddle', with a Vignette of the Sphinx below the Title. And this book, if ever written, as it soon will be if I am in a situation to do it, will be one of the births of time."

[2] The references are to volume and paragraph.

which the complexity of whatever is presented may be analyzed. For his object is to establish a science of phaneroscopy (phenomenology) which would describe the total of whatever is present to the mind in any way (phaneron), irrespective of the "realities" to which the phanerons correspond or of their physical and psychological conditions (1.287).[3] Now the study of the phaneron, Peirce claims, shows it to contain three indecomposable elements or aspects, which are the three categories. But he was careful to point out that these elements are not *existentially separate*, and that their analysis consists only in tracing out the relations between features isolated logically (1.294). The elements of the phaneron are indecomposable, because they show no differences in internal logical structure, although there are differences in the structure of their possible compounds (1.288, 1.291). The categories seem to be, therefore, factors continually present in all experience (1.134), and indissolubly intertwined with one another. We may *distinguish* the factors from one another, but we can not, even in imagination, *dissociate* them from one another or from other conceptions. We may indeed *prescind* or *suppose* some from the others in the same way as we prescind or suppose space from color (1.353); but we must never regard them as atoms out of which anything is constructed, since they are always only distinctions in everything presented (1.286).

Although the categories primarily characterize the phaneron, Peirce also regards them as representing congenital tendencies of the mind, and admits that so far he agrees with Kant. But he makes a careful study of the facts in various fields in order to confirm the pervasiveness of three modes of being (1.374); for he regards the list of categories as "a table of conceptions drawn from the logical analysis of thought and regarded as applicable to being" (1.300). It is difficult to evaluate his performance, since the analogies he finds between features in different subject-matters are very tenuous, the argument is often *post hoc*, and he himself points out in one case at least that the categories he finds in one domain do not correspond precisely with those in another (1.452). He uses (and thereby abuses) propositions in the general theory of conics to illustrate fundamental metaphysical distinctions, and the outcome is very mystifying metaphysics indeed (1.362). Finally, it must be remembered that Peirce admits his triad of categories does not exhaust all the categories (1.525), so that there is reason to suppose that his predilection for trichotomies was nurtured by his studies in the logic of relations; although

[3] This approach has many obvious affiliations with the "presuppositionless" studies of essences by Descartes, Husserl, and Santayana, although in the light of Peirce's devastating critique of the Augustinian-Cartesian philosophy in his earliest papers, too much can not be made of this similarity. And after the nature of Thirdness has been discussed it will be seen how full of presuppositions Peirce's analysis really is.

what the intimate connection is between these studies and his metaphysics Peirce leaves the reader to guess at random.

Let us turn to the categories themselves. The Category of Firstness indicates the aspect of freshness, life, freedom, variety, and spontaneity in the phaneron. Thus it would seem that Firstness presents the phase of atomicity, specificity, or sheer quality in experience. A quality is just what it is, and in its sheer immediacy is utterly disconnected with any other quality. On the other hand Peirce regards Firstness as a "pure nature" or quality to which embodiment and localization are essentially foreign (1.303). A quality is eternal, independent of time or of any realization (1.420); it is simply a "may-be," whose nature is that it *might* be a specific moment in a phaneron. Nevertheless Firstness is not a general or universal, since to be a universal involves reference to embodiment and localization (1.304).

It is not easy to reconcile these various characterizations of Firstness. Peirce seems to shuttle back and forth between regarding Firstness as the absolutely specific, immediate quality in the phaneron, as a determination which is not an "abstract suchness" (1.303, 1.306) on the one hand; and on the other hand, regarding Firstness as pure potentials, involving a variety and spontaneity which "is not definitely there," mere "may-bes" not necessarily realized (1.373). He thus alternates between conceiving Firstness as being simply a distinction within the phaneron, and conceiving it as a disembodied but substantial essence. Firstness is at the same time a mere "possibility" and the element of spontaneity; it is declared to lack generality, and also to be of the nature of a general, capable of further determinations (1.447). Peirce himself acknowledged that "possibility" was a misnomer for firstness, since it mistakenly suggested a relation to what exists (1.531). But he adds a final touch to these confusions when he identifies Firstness or quality, not with immediate, physically inefficacious quality, nor with an abstract isolated possibility, but with the *power* bodies have of determining future manifestations of inefficacious qualities (1.422). Firstness is then conceived as a dynamic relation, and so an element of law or regularity (Thirdness) is introduced into what started out to be the element of spontaneity.

Further difficulties arise when the connection of qualities with feelings is examined. A feeling for Peirce is an element of immediate consciousness, a quality of it which is not an event (1.306); and a quality in general is something which is vivid and conscious (1.357). There is thus a tendency to identify qualities with feelings, and so it is only a short step to impute feelings to whatever has qualities, for example, to inorganic matter. Indeed, "dead matter" can excite feelings in us, only because dead matter isn't dead at all (1.311). Consequently, Peirce must be included among those who use with abandon an uncritically formulated principle of continuity. Like can come only from the like, and so the qualities which humans enjoy are communicable and find their counterparts in non-human situations. "I am confident,"

Peirce declares, "that a bull and I feel much alike at the sight of a red rag" (1.314). Far be it from me to question this assertion, especially since I do not know what it means. I do not see, however, how it and similar statements are reconcilable with Peirce's logical pragmatism. He himself declared that in immediate experience there is no *knowledge*, so that if Firstness indicates the element of spontaneity, every description must be false to it (1.357). And I think this is true, because of that which is wholly immediate nothing whatsoever can be said, for the simple reason that the wholly immediate is not the subject-matter for any saying.

We turn to the second category. Secondness indicates the element of brute fact, struggle, actuality. It points to fact, within which distinct elements stand in opposition to one another, for all existence is always a matter of blind force. Facts are determinate with respect to every character. They involve physical things acting upon one another *hic et nunc*; 'these physical things *are* the sum of all the consequences of their so acting here and now. But Peirce points out that the individual mode of behavior indicated by Secondness is not *determined* by any law (1.440); a stone falling here and now is not *made* to do so by any law of nature (1.323). Hence the proposition that every event is precisely determined must be abandoned, since it is only approximately true (1.402).

Secondness thus points to the element of contingency, of something "accidently actual" in the phaneron (1.427). Peirce would have been sympathetic with recent attempts to revive causality as a distinct category not analyzable into uniform succession (1.325). For Secondness denotes a necessity which is natural, and also unconditional, forceful, ultimate, a quality of operative events. At the same time, Secondness points to a radical indeterminism in the behavior of nature, so that Peirce anticipated in general outline the statistical interpretation of natural laws.

Unfortunately, but perhaps inevitably, Peirce's discussion of Secondness is almost entirely in anthropomorphic language. We may cite as examples his characterization of fact as something which "fights its way into existence; for it exists by virtue of the oppositions which it involves" (1.432); and "the existence of facts consists in fight" (1.435). This anthropomorphism Peirce often regards as a virtue, and once again a principle of continuity is employed to read strife, struggle, effort, which are features of human life, as generic traits of all nature. But where shall one draw the line – why not read desire, revulsion, love, into every nook and cranny of the world as well? Peirce, like many contemporary thinkers, did not hesitate at times to draw just such conclusions. Now the world may, indeed, be populated with many more qualities than we ordinarily suppose. But why should we uncritically admit them, at the behest of a dubiously stated principle of continuity? Why should we overlook the fact that the qualities we experience are functions, in part at least, of the interaction of our own bodies with the rest of nature, and that

they can not therefore be imputed to segments of the world where such interaction is not going on?

An equally serious shortcoming is Peirce's failure to analyze the meaning of contingency, and to state how he conceives an event to exhibit a contingent aspect and also to illustrate a uniformity. Is the contingency of an event an absolute character of it, an m mediate quality of a *hic et nunc* operation; is it a relational character, so that an event has a contingent aspect with respect to one set of circumstances but not to another set; is it synonymous with the sheer plurality and variety of things; or is it all these things and something else besides? This problem is especially important for Peirce, because as we shall see, uniformity is taken by him as a temporally derivative character of events.

Let us examine the final category. The category of Thirdness introduces the element of determination by law. A law is the mode of being which consists in *future* facts (of Secondness) taking on determinate general characters (1.26); a law is how an endless future must continue to be (1.536). Thus, Thirdness involves the idea of something general, which can not ever be completely actualized and so refers to an indefinite future. Thirdness or law, according to Peirce, is akin to thought; it can be produced and grow, it can be communicated and is general. It addresses itself to two realms: as general, it concerns itself with the realm of possibility or quality; as factual, it refers to the actual world (1.420). Since Thirdness is involved in all communication, the correct analysis of the category leads inevitably to the study of the nature of signs. But we will examine this aspect of the matter in the next section.

At this point, let us see the use Peirce makes of his categories in his cosmogonical speculations. According to him, every sound metaphysics must be evolutionary. This dictum is based largely on the further dictum that what needs to be explained is not the variety, freshness, and unpredictability of things, but the uniformities which they exhibit. Uniformity must be "explained" by showing how, out of a primal spontaneity, together with a *tendency* in the flux to take on habits, laws or habits have *evolved* (1.175). In a sense, therefore, Thirdness is not as "ultimate" a category as Firstness, since regularity grows out of pure chance or Firstness (1.407). In the infinitely distant past there was no law, only chaos together with a tendency toward uniformity or the elimination of indeterminacy (1.409). Hence the three active elements in the universe are chance, law, and the tendency for things to take on habits.

Is it possible to make a coherent scheme out of all this? In the first place, let us recall that the categories should be regarded as *distinctions* within the phaneron, not as active elements out of which whatever exists is to be constructed. However, if we also recall that phaneroscopy has nothing to do with the question of how far the phaneron corresponds to any reality, what meaning shall we assign to Secondness and Thirdness which specifically

involve reference to the actual world? Can anyone, least of all Peirce, maintain that the nature of law is to be learned independently of the operations of "real" beings and of the use of the discursive methods of the sciences? Indeed, if there is nothing in immediate consciousness except feeling or quality (1.317), how can the phaneron exhibit elements of Secondness and Thirdness? Peirce himself declares that law unrealized is merely a pure first, a quality possessed, and is not a "genuine" law.

Secondly, is the idea of law as something active anything other than Plotinian and Schellingian poetry? It is true that Peirce calls Thirdness a law only when we, contemplate it from the outside, while if "we see both sides" it shows itself to be akin to thought (1.420). But change of terminology does not always solve a difficulty, and Peirce does not show how the radical indeterminacy of fact is compatible with the *activity* of thought or law in determining what future facts are to be.

Thirdly, what is to be said for the dictum that uniformities, and only uniformities, require explanation? Is it not patent that we sometimes seek to explain a regularity and at other times the lack of regularity? For what, anyway, is an explanation? Is it not the case that we "explain" an event or law when we exhibit it as an element in a more comprehensive order or uniformity? Thus we explain why a glass breaks when hot water is poured into it, by showing that *types* of relations, like the flow of heat, the elasticity of a substance, and the unequal expansion of a substance, are exhibited in the explicandum. These types, if they are to explain, must be pervasive modes of behavior, must be what are called "regularities." Peirce himself is compelled to take note of them. He can not possibly get order and connection by simply taking them as *growths* from a primal chaos; he must take for granted some form of order, e.g., a tendency in things to take on and conserve habits. For the hypothetical chaos is completely unintelligible, and can not be the explanation of anything. One may explain a specific law by showing it to be the consequence of a more inclusive order. But one can not explain order as such, since it is the principle of explanation of everything else. What order we take as primary in any inquiry depends upon the state of our knowledge and the demands of the problem; *some* order we *must* assume, just as *some* plurality *must* be taken for granted if anything is to be explained. Peirce was motivated in his cosmogony by a bias toward a spiritualistic interpretation of the cosmos, and by an understandable reaction to philosophies of his day which attempted to derive the variety of things from a primal homogeneity. The moral is that it is just as much a mistake to deny an ultimate specificity and variety, as it is to deny an inexpugnable order. It is instructive to compare Peirce with Spinoza. Both recognized nature to possess a structure and also to contain an inexhaustible variety. Peirce chose to emphasize the latter and to regard the former as derivative. But I think Spinoza was both sounder and wiser when he included in Part I of the *Ethics* Prop. 15 as well as Prop. 28.

Finally, one must seriously question Peirce's facile reduction of laws of nature to "habits." No doubt there is an analogy, often a fruitful one, and no suggestive hypothesis should be neglected. But do we know the nature of human habits so well that we can pretend to throw light on the nature of laws by using the former to explain the latter? What real evidence is there for Peirce's assumption that natural laws are like habits which human beings take on and occasionally drop? It is true that almost all our scientific terms, even the most neutral ones, are infected with meanings carried over from the specifically human scene. But this should not be taken as a license to exercise one's speculative fancy and so regard processes in all parts of nature as simply human processes writ large. The issue is not between affirming immutable laws of nature and affirming the contrary. The flux is what it is, and why should a naturalist on *a priori* grounds deny anything of it? But whatever the flux is, the issue is to examine any allegation concerning it with scrupulous care, in philosophy as well as in science. And if it is alleged that laws grow and change, while at the same time laws are not identified with any segment of the flux, especial care should be taken to determine the sense in which laws "change," considering that change is taken as a fundamental character of the flux itself.

II

Although the triad of categories is a persistant melody running through most of Peirce's writings, many of his doctrines can be understood better in connection with his theory of signs. The magnificent series of papers in the *Journal of Speculative Philosophy*, in which he broke with the Cartesian tradition dominating modern philosophy, was inspired by his recognition of the function of signs in thought. Like Aristotle, Peirce was impressed by the fact that language is the medium in which the rationality of the world becomes expressed and communicated; and he went so far as to say that "the woof and warp of all thought and all research is symbols, and the life of thought and science is the life inherent in symbols" (2.220). "My language," he declared, "is the sum total of myself, for the man is the thought. The identity of man consists in the consistency of what he does and thinks, and consistency is the intellectual character of a thing, i.e., is its *expressing* something." Representation or the operation of signs (mediation or Thirdness) is therefore one of the fundamental categories, and to its study Peirce devoted his best energy.

Peirce's ideas on signs are the most difficult and obscure of all he set down on paper. Only a meager outline is here attempted. Anything whatsoever (e.g., physical object, image, quality, thought) may be a sign, so that signs differ from one another in several important ways. But in any case, every sign involves a triadic relation. For in every case where a sign functions, there is

first, the sign with its own material quality; secondly, there is the object *of* which it is a sign, and which it represents in some respect (the *ground*); and thirdly, there is the thought to which it is addressed, the interpretant *to* which it is a sign. In Volume II Peirce discusses each one of these three aspects of the sign, each aspect yielding three divisions.[4]

And first, when we attend to the material quality of signs, we find three types: a sign may be a pure quality or possibility, something which as a pure quality is disembodied, even though it can not actually function as a sign until embodied (a *qualisign*); or it may be an actual existent, a physical thing or event (a *sinsign*); or finally, it may be a general law, rule, or habit (a *legisign*). Every sinsign clearly must involve qualisigns, while every legisign functions through sinsigns which are instances or "replicas" of it. Thus, in one sense, each time "three" occurs on a page there is a distinct word, each being a sinsign; but in another sense, these distinct sinsigns stand for the very same word (legisign), which is a general rule or convention for the production of sinsigns. All conventional marks are signs not because they can be seen or touched, but because they are replicas of a type which signifies *through* its instances (2.244).

Secondly, when the sign is studied with respect to the relation between it and its object, the following three types are found: a sign is an *icon* when it refers to an object because of its own intrinsic features, which nevertheless it possesses in common with its object (e.g., a diagram or picture); it is an *index* when it is really (dynamically) affected by its object (e.g., a street cry, the rolling gait of a man as a sign of his being a sailor, or a weather-cock); it is a *symbol*, when it operates to be interpreted by virtue of a law or association of general ideas (e.g., a proposition, all conventional signs). Peirce regarded this as the most important division of signs. The only way we have of communicating and thinking, according to him, is by means of direct or indirect use of icons (2.278). But icons generally function as constituents of indices, which in turn are constituents of symbols; and symbols, being general, involve laws referring to the indefinite future, and so require legisigns and sinsigns to function (2.293).

Thirdly, when the sign is examined with respect to what its interpretant understands it to represent, the following three types are found: when the sign is taken as representing a kind of *possible* object or quality, when it represents an object merely with respect to its characters, it is a *rheme* (in modern terminology, a propositional function); when it is taken as a sign of actual existence, when it represents its objects with respect to the actual existence of the object, it is a *dicisign*; when it is taken as a sign of law or regularity, it is an *argument* (2.252).

[4] In a later volume he will distinguish ten trichotomous divisions, giving sixty-six independent classes of signs.

If we combine these three sets of distinctions in all possible ways, we get twenty-seven (i.e., 3^3) classes of signs, only ten of which are independent. Peirce discusses them with great subtlety. We can not report his analyses, but turn instead to some of the applications he makes of his studies on the role of signs in discursive reasoning.

(a) *The nature of meaning*. It is not intended to add here another specimen to the sixteen meanings of "meaning" captured by Ogden and Richards. I only wish to point out that most analyses of meaning have gone off the track because they identify meaning with some essence, image, or thought, instead of studying the structure of the situations in which meanings occur. Peirce's discussion of signs should make us aware that "meaning" is a triadic relation involving a sign, its object, and its interpreter, so that an exclusive concentration upon one of these terms must of necessity yield an inadequate analysis of the nature of meaning. It may be thought that the specific introduction of the interpreter as a factor in the analysis of meaning, involves the introduction of irrelevant psychology which will only becloud a very beclouded problem. But quite the contrary is the case. For this analysis isolates the different factors in a meaning situation, allows us to explore the general conditions under which signs may adequately represent their objects irrespective of any specific interpreter, and then emphasizes the ineradicable role of the interpreter. Thus we can discover that a sign must be a "logical map" or icon of its object if it is to represent it adequately; and we can also consider the social factors which enter into the activities of the interpreter which determine how he interprets signs, without however altering the validity of the first analysis. Meanings are not qualities or essences; they are the structure of certain situations in which such triadic relations are exhibited.

Consider, furthermore, the problem as to the nature of propositions. A proposition is sometimes identified with judgment, understood as a psychological act; sometimes with a fact or state of affairs; sometimes with a substantial, non-temporal, non-spatial entity or essence; sometimes with a sentence in all its particularity. Peirce, on the other hand, is able to avoid both the hypostasis and the psychologizing of propositions by analyzing them as *dicent symbols which are legisigns*. Hence a proposition is a sign, and requires a three-fold reference: it is a sign which is connected with its object by an association of general ideas; it is dynamically connected with its object if it is true, and is *interpreted* as representing a situation *located* in the realm investigated; and it also has a determinate material quality, determined by a general rule or convention, so that "*cogito*" and "I think" stand for the same proposition.

It is also relevant to mention in this connection that most of the recent work in symbolic logic has devoted exclusive attention to the iconic feature of signs, and has neglected their very important *indexical*, *symbolical*, *and argumentative* aspects. The dissatisfaction which many philosophers have felt with symbolic logic may perhaps be explained on this ground. And it is not too

much to say that an adequate philosophy of logic will not be achieved until the neglected features of signs receive a complete study.

(b) *The doctrine of fallibilism.* Every sign addresses itself to some thought or interpreter, and this in turn, according to Peirce, is a sign, which must address itself to another thought, and so on without limit. This indicates the nature of all discursive thought, and it is largely for this reason that he denied knowledge to be immediate apprehension. All cognition requires mediation, interpretation, and reference to an indefinite future. There can be no absolute finality or complete certitude, since the process of interpretation is an unlimited one. The method of science is self-corrective. We can not doubt all things at once; but without being dogmatic or skeptical, we can construct hypotheses, submit them to empirical tests, reconsider the hypotheses and tests in terms of other hypotheses and observations, and so on endlessly. Thus while the sciences aim at exactitude, universality, and complete certitude, these are ideal limits which they can never reach, and which it is suicidal for them to claim to have reached. All our knowledge, in the natural sciences as well as in mathematics, is fallible.

The import of this doctrine will be clearer if we bear in mind that the complete certitude Peirce denies we can attain, is *not* a psychological state of strong conviction, but is a complete *logical* ground for the propositions we assert. The following considerations will bear this out.

(1) Peirce makes clear that it is the fallibility of *discursive thought* which he is asserting, and that he is not denying the immediacy of direct experience. Kant's sharp distinction between observation and reflection he believes is mistaken, because all significant observation involves interpretation, so that reasoning does *not* begin *after* observation is over (1.35). The consequences of this criticism, as everyone knows, are momentous for the theory of science. And he has a crushing retort to those who claim absolute certainty for the objects of direct experience: "Direct experience is neither certain nor uncertain, because it affirms nothing – it just is.... It involves no error, because it testifies to nothing but its own appearance. For the same reason, it affords no certainty" (1.145).

(2) The claim to infallibility is only a hindrance to inquiry, since what we want to know concerning any proposition is whether it is well supported by evidence. The claim to finality, however, confuses the question of the logical value of the evidence with the question as to the psychological certitude we may possess. Accordingly, since the first rule of reason is "Do not block the way of inquiry" (1.135), we may dismiss as obstacles the claims that we have absolute certitude, that there is something we can never know, that something or other is basic or absolutely simple, and that some law or other has received its perfect formulation.

(3) It is a very crude analysis which declares that things are sharply cut off from one another, like the traditional pictures of atoms as billiard balls. The

contrary is the case, according to Peirce, for "all things swim in continua." Our concepts, too, shade off into penumbral regions of indeterminacy, so that our knowledge "swims in a continuum of uncertainty and indeterminacy" (1.171). Hence the "laws of nature" must be interpreted as describing the approximate behavior of large groups, and do not describe without serious qualifications the behavior of their individual members (1.156).

(4) A pragmatic theory of meaning involves an implicit reference to the future in every judgment about matters of fact. To call a piece of stone *hard*, is to *predict* how it will behave and what effects it will have in the future (1.615). Hence every present judgment is subject to correction, since it involves an endless series of verifications. Science is therefore not so much a body of established truth, as a diligent search or process of inquiry into truth (1.44).

Against the doctrine of fallibilism many thinkers will no doubt raise the objection that we can not be said to "know," unless what we know is in fact the case. Anyone claiming to "know" that the earth is flat, it will be said, claims what is false, for we could *know* that proposition to be true only if the earth were indeed flat. Hence, if there is such a thing as knowledge, it must be absolutely certain; on Peirce's view, however, it will be urged, we may have opinion and belief, but never authentic knowledge, since knowledge is not subject to revision. To this objection there is only one reply. Knowledge so defined that when we have it we can not possibly be in error, is the ideal goal to which we strive; but it is Peirce's claim that we have not yet anything to illustrate such a knowledge beyond every possible doubt. It may well be that certain propositions claimed as knowledge will never be significantly challenged. The indubility that attaches to such propositions comes, however, not from any analysis of the nature of knowledge nor from a psychological sense of certitude, but from the fact that they are supported by evidence overwhelming logically. Nevertheless, in all discursive thinking there is always the possibility that we are mistaken in what we allege to know. There are therefore no ultimate first principles intuitively reached which is the bed-rock of all certitude. There is only science as a self-corrective process, steering midway between a stultifying skepticism and an unimaginative dogmatism.

(c) *Logic and mathematics*. But what does Peirce do with logic and mathematics, it will be asked. Can he successfully extend the principle of fallibilism to apply to them? The attempt to do so is indeed one of the most interesting features of Peirce's writings on logic; and it merits careful study because he was bitterly hostile to the psychologizing logicians of his day.

Logic in its broadest sense is understood by him to be general semeiotic, or the science of what must be and ought to be the nature of true representations or signs (1.444, 1.539). Logic is thus inextricably related to language. Corresponding to the three-fold nature of signs, it has three departments: *critical logic*, the theory of the conditions for the *truth* of signs; *speculative*

grammar, the theory of the nature of signs in all their aspects; and *speculative rhetoric*, or the theory of the conditions of reference of signs to their interpretants (2.93). The content of speculative grammar has already been indicated; and apparently Peirce wrote nothing systematically on speculative rhetoric, in spite of his belief that general methods could be stated for attacking the solution of problems (2.108). There remains to indicate something concerning the nature of critical logic.

The task of critical logic is the classification of arguments with respect to the form of their constituent propositions and the frequency with which true premises of a determinate type yield true conclusions. Each argument requires a *habit* of inference, which when formulated is the leading principle or canon of that *type* of argument. These habits are *general* since they refer to an indefinite future, and in a determinate class of arguments commit us to few or no false conclusions (2.148, 2.446). Some leading principles are perfectly general or formal: they are involved in every set of premises, and are the logical principles *par excellence*; others have a more restricted generality, and are material principles (2.466, 2.589).

The consequences of taking leading principles or generalized habits as the basis for valid inference are many. It enables Peirce to supply an objective, matter-of-fact foundation for all inference, and so indicate the relevance of material considerations in formal logic. The naturalistic strain in him shows itself at its best in his discussions of the metaphysical grounds of logical canons of inference (2.710 ff). It also enables him to treat in a unified manner both necessary and probable reasoning, since the former is a limiting case of the latter when the leading principles employed have relative truth-frequencies whose values are always unity (2.696). It permits him to do justice to the purely mechanical element in inference, and admit that logical machines perform inferences even though they do not think (2.59). And it permits him to avoid a crude empiricism with respect to logic, by associating the canons of deductive or explicative inference with the analysis of *signs*, so that he can retain his naturalism and still admit that the experiential element in logic is all but nil (2.65).

Nevertheless, not everything that Peirce says about inference is crystal clear or consistent. There remains an unbridgeable gap between probable and necessary reasoning which he reluctantly admits when he asserts that a class of arguments whose relative truth-frequency is unity, does not *therefore* belong to the class of necessary inferences (2.369). And when he asserts that the process of substitution, so vital in formal reasoning, is non-inferential, simply because the propositional forms employed have no *specific* meaning or reference, he exhibits serious limitations in his understanding of the distinctive marks of inference (2.496).

Let us turn, however, to his analysis of deductive reasoning and to the incidence of the doctrine of fallibilism upon it. We can best do this in

connection with his discussion of mathematical reasoning. Peirce was profoundly influenced by F. A. Lange's *Logische Studien* and always maintained that both logic and mathematics were "observational sciences." This *aperçu* depends on recognizing that all reasoning is by means of and upon signs. In mathematics, for example, we construct a diagram (i.e., any complex sign) according to a general rule; we observe relations between parts of the diagram not stated explicitly by the rule; we show that the diagram is a fair sample of all the diagrams determined by the rule, so that these relations hold always (or at least in a certain proportion of cases) for any such diagram; and finally we state these relations in general terms as the necessary (or probable) conclusion of the investigation[5] (1.54, 1.66). In the sense, therefore, that explicative reasoning is diagrammatic, it requires observation, since we must construct diagrams, at least in imagination, and *observe* them (1.240); and it will be seen that the discussion does not depend on the status of the controversy between opponents and defenders of "imageless thinking." Hence, mathematics is no more infallible than other positive sciences of observation, and every mathematical inference is accordingly a matter of probability (1.248, 2.192) even though it may be beyond every reasonable doubt.

Whatever else may be said of this extension of the principle of fallibilism to mathematics, Peirce has rendered a service in pointing out how insecure logically are all claims for the self-evidence of mathematical propositions. The history of logic and mathematics amply bears out the substance of Peirce's warnings against an arrogant infallibilism; it shows that here as elsewhere, general principles are but slowly apprehended, require to be carefully tested out, and the limits of their application are never completely free from doubt. Nevertheless, there is a good deal of confusion in his contention that mathematical reasoning is "probable." His illustrations indicate that he means by that characterization simply that we, and thousands of others, may have blundered in adding a column of figures or in deducing the consequences of a set of premises. But there is an important difference between the assertion that "7 + 5 = 12" is only probable because *we* may have erred, and the assertion that "all men are mortal" is probable because the evidence from biochemistry and physiology is incomplete and because there is a reference to a contingent future. In the first case we are dealing with the connection of relations having the utmost generality possible and not subject to change; in the second, the subject-matter is a segment of an incompletely determined flux.

[5] In this emphasis upon the role of diagrams Peirce anticipated much of the mathematical philosophy of Hilbert, although his motivation is clearly different. Like Hilbert, he denies that mathematics ever requires the aid of logic (1.247, 2.191), although this dictum seems to depend upon his taking "logic" in this context to be a science of *fact*, and not the formal science of consequences of hypotheses.

And Peirce himself, as we shall see, stood out firmly against confusing probability with ignorance.

Peirce's views as to the nature of mathematics are amazingly up to date. He saw clearly that pure mathematics is a hypothetico-deductive science, that it does not make categorical assertions about what exists (1.53), and that all *a priori* arguments about matters of fact are just rubbish (2.137). But he did not always see the implications of these insights. Thus he thinks that "two straight lines can have only one intersection" is an evident proposition (1.130), and that the postulates of geometry are only approximately true (1.131). He can not therefore be regarded as having anticipated Poincaré and Duhem in their profound studies on the connection between applied mathematics and physics.

(d) *Nominalism*. It is clear from what precedes that Peirce could not agree with those for whom the only mode of being is that of individual objects which crowd out a place for themselves by sheer force. Such a view he characterized as nominalism, and he called himself a realist because he recognized the mode of being of law or Thirdness.

Peirce takes great pains to make clear that by a law or universal he did not mean a "thing" or a "particular." When a man believes that the property *hardness* is not invented by men as the word "hard" is, he says, "but is really and truly in the hard things and is one in them all, as a description of habit, disposition, or behavior, *then* he *is* a realist" (1.27n). The mode of being a law consists in the fact that future acts will take on a determinate general character. Whatever is general is something which is the *object*, not the creature of thought. And it can not be identified with any finite set of particulars, since "its being is in the instances which it will determine" (2.249).

Peirce's realism is thus of the "moderate" kind. Universals or laws are not capable of localization in space and time, not something added to the particulars so localized. They are the modes of behavior and the relations between modes of behavior of things in space and time. In spite of his flirting with the idea of "pure possibilities," in spite of his saying that a typical mathematician must be a Platonist for whom the universe of "actual" existence is but an arbitrary locus in the eternal, the substance of his reflections on universals is to tie them indissolubly to the flux of things. The supposition of universals with no reference to the flux is as meaningless as the supposition of a flux which did not embody universals (2.330).

But there is no doubt Peirce was not always faithful to his best insights into this matter. Most puzzling is his philandering with the idea of final causes, so that he sometimes thinks of laws and ideas as operative and efficient. Thus, he declares that when an idea is communicated "it had caused something to happen in your brain" (1.213); that while heredity is a law and not a force, it "like other laws doubtless avails itself of forces" (1.215); and that "every general idea has more or less power of working itself out into facts" (2.149). These expressions may be simply metaphors. It is, however, a metaphor

which strangely persists in much of the discussion of Thirdness, and must make Peirce's readers question the integrity of his realism. For to endow laws with efficacy is to particularize them into things, and is an invitation to the nominalist to ask his unanswerable "When? Where?" Nor is the reader's doubt allayed when Peirce permits himself to say that the number system is our own creation, and that mathematical reasoning holds simply because it deals only with the creations of the mind (1.149, 2.192). It is a high price, even for fallibilism, to explain the unusual logical certainty of mathematics by regarding its subject-matter to be nothing more than an entertaining convention.

III

Peirce was justly proud of his having been brought up in the laboratory and of so having acquired the experimental frame of mind when still young. And indeed his best developed writings are the contributions to the theory of deduction and to the analysis of probable reasoning.

The substance of his discussions of scientific method centers around his perception that science is surer of the correctness of the general procedures it employs than it is of any specific result achieved by them. Those procedures involve the specific application of a self-corrective hypothetic-deductive method, and Peirce was convinced of the universal applicability of that method. He was eager to defend it against all corners, like a knight his fair lady whom he has chosen from the entire world. He could, therefore, consistently attack the positivists for their doctrine that all hypotheses must be capable of direct verification (2.511n), and also declare that the full meaning of a proposition is to be found in what it prescribes us to do to gain perceptual experience (2.330). Even without waiting for his complete writings on pragmatism, which will appear in later volumes, it is possible to form a fair estimate of the studies on scientific method contained in these volumes.

Peirce made much of the distinction between explicative and ampliative reasoning. Explicative reasoning is either *necessary* or *probable*, ampliative reasoning either *inductive* or *presumptive*. We have already considered the main features of the first, and shall return below to a more careful analysis of probable inferences. What is ampliative reasoning? In general, says Peirce, it is such that "the facts summed up in the conclusion are not among those stated in the premises. They are different facts, as when one sees that the tide rises *m* times and concludes that it will rise the next time. These are the only inferences which increase our real knowledge, however useful the others may be" (2.680). But let us see what its species are.

Induction consists in inferring the constitution of a class from the constitution of samples drawn from it. We determine by induction the nature of a cargo of wheat through judicious sampling; this process determines for us, by

empirical means, the ratio with which certain characters occur. *Presumptive reasoning*, on the other hand (also called abduction, retroduction, hypothesis), consists in inferring an explanation, cause, or hypothesis from some fact which can be taken as a consequence of the hypothesis. Presumptive reasoning is therefore the provisional adoption of a hypothesis, because every possible consequence of it is capable of verification, so that by pursuing this method its disagreements with facts will be revealed (1.68). The difference between induction and presumption is that the former infers the existence of phenomena homogeneous to those already observed, while in the latter something heterogeneous to that already observed is concluded, even something impossible for us to observe directly (2.640).

Now Peirce believes that these forms of inference are different from explicative probable reasoning, which he also calls statistical deduction. For the latter is probable, as we shall see more fully below, in the sense that though in a particular case its conclusion is false, yet in the long run and with a definite ratio, *similar* conclusions would be approximately true. But induction, for example, is probable only in the sense that though it may give a false conclusion, yet in the long run where the same process is used, a *different* but approximately true conclusion would be drawn (2.703). Thus, in probable reasoning the predicted conclusion is *verified* in the long run in a definite ratio of all the cases; in ampliative reasoning, the predicted conclusion will be *changed* in a good proportion of the cases, but will become approximately correct in the long run (2.709).

But it can be shown that the distinction between statistical deduction and the species of ampliative reasoning is only a *psychological* one, and refers simply to the various degrees of completeness our knowledge may possess. The distinction does not touch the *logical* question as to the *validity* of these forms of inference. For consider: If we reason at all, we must reason from premisses, and if we reason validly we do so because the conclusion is obtained in accordance with the leading principle or canon of the argument. When Peirce asks how it is possible that a man can observe one fact and then pronounce judgment concerning another fact not involved in the first, and when he then adds that such reasoning has no definite probability (2.690), he is surely inconsistent with his own analysis. If the inference is made in virtue of some leading principle, it *does* have some degree of probability, namely, the relative truth-frequency associated with that principle. If the "inference" does not involve a leading principle, *no reasoning* takes place in any usual sense of the word. Thus, I sample a bag of beans and find half the sample is white. If I *know* nothing concerning the representative nature of the sample, I can *conclude* nothing about the color of the beans in the bag, although I may make a guess, consider my guess a hypothesis, and then proceed to test the hypothesis in the usual way. But if I *do* know that samples drawn in the way I drew this one *are* representative of the beans in the bag, I can conclude

something about the constitution of the bag by statistical deduction; and the argument is probable in the sense to be defined presently. Ampliative inference is thus the experimental process by which we determine approximately the numerical values of the relative truth-frequencies involved. But as Peirce himself admits, its species are inverse forms of deductive probable inference, and their *validity* (the only relevant question in logic) is the validity of statistical deductions (2.511, 2.718).

We need discuss therefore only the theory of deductive probability, which Peirce adopted from Venn and developed in an original way.[6] The following are its essential features: (1) Probable inference, like all inference, depends for its validity upon determinate relations between *propositions*. (2) No proposition is probable intrinsically, but only with respect to other propositions which are evidence for it. Probability is thus a *relation* between propositions. (3) Whether a proposition has or has not a degree of probability on definite evidence does not depend on the state of mind of the person entertaining the proposition. Psychology is as little (or as much) relevant in probable inference as it is in necessary inference. (4) An inference is probable in so far as it belongs to a *class* of inferences in which the frequency of the conclusions being true is a determinate ratio of the frequency of the premises being true. Probability is the *limiting value* of the fraction whose numerator is the number of times both antecedent and consequent are true and whose denominator is the number of times the antecedent is true, as the number increases *without limit*. Hence probability is not, as on Keynes' view, an unanalyzable concept. (5) The same proposition may have different degrees of probability in accordance with the sort of evidence which is marshaled in its support. But the relevance of the evidence can not be determined on formal grounds alone.

It is clear that since probability is the limit of an endless series, we can never assert categorically the value of a probability. Hence the assertion that such and such is the probability of a proposition is always a *hypothesis*, always subject to correction. And hence, also, the sole business of the experimental sciences, since we can not exhaustively study all of nature, is to carry on *sampling operations* which will indicate approximately the values of different probabilities.

The question remains, therefore, under what conditions the process of sampling will lead us to an approximately true knowledge of the constitution of a field. Peirce prepares his reader by first rejecting *in toto* all theories of probability which are based upon the principle of equal distribution of ignorance; second (this is a corollary from the first) rejecting the use of

[6] A rigorously systematic discussion of the theory was never given by Peirce. It has been left for German students (Von Mises, Reichenbach, Tornier) to discover independently the fundamental principles of the truth-frequency theory.

inverse probabilities; and third, denying that the validity of sampling depends on any material assumptions such as the uniformity of nature (2.102, 2.749). According to him, sampling is a valid process whatever be the constitution of the universe, since its validity follows from the *manner in which the sampling is conducted*. And the following are the conditions under which sampling is a reliable process: first, the subject-matter must have a determinate nature; second, the sampling should be carried out without bias, the samples must be "fair"; and third, the characters whose distribution is investigated must be pre-designated or predicted prior to drawing a sample, if that sample is to serve as evidence for any hypothesis concerning the constitution of the field. And Peirce concludes that while in any given case the process may lead to false results, it will, if pursued far enough, approximate more and more closely to the truth.

Now it is true that the method of sampling Peirce discusses is, in general outlines, the one pursued in the sciences. But isn't Peirce claiming more for the method than is warranted? Thus, the assertion that if samples are drawn "fairly," i.e., without bias, they will ultimately yield a "fair," i.e., representative, sample of the constitution of a field, is either a bald tautology, or is a *material* assumption to the effect that the specific mode of sampling is carried on in such a way that every variation in the field will turn up in our samples at some time or other. But if the amount of independent variety in the field should be indefinitely large (or even too large to handle with the methods at our disposal) we may never obtain representative samples no matter how, or how far, we carry on the process. *Some material* assumption, e.g., the existence of a limit in a rapidly converging series of variations, or the existence of a finite number of types or classes in nature, seems to be required if the process of "fair" sampling should yield representative ones. It is true that such a material assumption is itself a hypothesis, and must be evaluated in accordance with the usual canons. But this only goes to show that we can get *no absolute guarantee* in advance that any given method will work, no matter how trustworthy it may have shown itself to be.

I also can not escape the impression that in spite of Peirce's vehement denial of the principle of antecedent equiprobabilities, it returns to plague him. The process of sampling depends on the fact that more samples of a certain kind appear than others. But why do they? Because, the answer is, more samples of that kind occur in the field studied. But since samples not yet drawn exist only *potentially* in the field, it is legitimate to ask why there should be potentially more of one kind than of another. And the answer seems to be that if all the relevant characters in the field were combined in every permissible way, *and if all these permissible combinations were antecedently equally probable*, then there would be more of one kind than of another.

Because of the sharp distinction Peirce makes between induction and presumption, he tends to obscure the identity of the processes employed, say,

in evaluating the constitution of a cargo of wheat and in determining the correctness of the theory of gravitation.[7] This has as a consequence an unnecessary restriction of the frequency theory of probability, a restriction which is being removed by modern students. But already Royce showed that in evaluating a theory we are taking samples from all its logical consequences. There is therefore no good reason to doubt the universal applicability of the frequency theory of probability and the essential identity of scientific method in all departments of science.

IV

The editors of this edition deserve the congratulations of all students for their self-effacing and intelligent labor in bringing a semblance of order into a wilderness of manuscript. They have almost achieved what Peirce thought impossible for mortal man to do. Each volume has been supplied with very full indices, and in several cases with helpful explanatory notes. In the light of the enormity of the task and the excellence of the achievement, it may seem ungracious to find fault. But I think it is unfortunate that Peirce's larger manuscripts have been broken up and distributed throughout the volumes; this is especially true for the completed *Grand Logic*, the several chapters of the *Minute Logic*, and the *Lowell Lectures*. One may also question the judgment of the editors in neglecting to include in these early volumes certain outstanding papers to illustrate Peirce's doctrines: e.g., his review of Frazer's *Berkeley* for his views on nominalism, or his essay on the "Fixation of Belief" for his doctrine of fallibilism. Because of the topical arrangement of the papers, the historically interested reader will be able to estimate the extent to which Peirce's ideas underwent change only by a painful leafing of each volume. It is hoped the editors will manage to include a table in the final volume indicating where the component parts of the larger manuscripts are to be found, and possibly also the chronological sequence of the papers.

Collected Papers of Charles Sanders Peirce. Edited by Charles Hartshorne and Paul Weiss. Cambridge: Harvard University Press. 1933. Vol. III, Exact Logic. Pp. xiv + 433. Vol. IV, The Simplest Mathematics. Pp. x + 601.

The original speculative power and acuteness of Peirce's mind appear at their very best in the present two installments of the *Collected Papers*. But space prohibits anything other than a brief indication of some of their striking contents.

[7] He declares he had committed a fundamental error in his Johns Hopkins essay on "Probable Inference," but he does not state explicitly what the error is (2.102).

Volume III consists entirely of previously published papers on what goes by the ill-fitting name of mathematical logic, and includes his great series of papers on the logic of relatives. Reading them consecutively one is impressed how steeped Peirce was in the mathematical researches of his day, and how the inquiries into the nature of generalized algebras by men like his father and Sylvester molded the course of his own thinking. There can be little question that Whitehead's *Universal Algebra* represents the culmination of some of Peirce's attempts in that direction. Many of the papers are now primarily of historical interest; and looking back upon them from the vantage ground of the elegant discussions in the *Principia*, they seem needlessly difficult simply because of the clumsy symbolism Peirce employed. And yet, in spite of the frequent incoherence of his statements, it is an inspiring experience to see him grappling heroically with novel ideas, conquering one only to attack another. These papers reveal that while Peirce strove mightily to achieve a philosophic system, he was essentially a man of great visions, but incapable temperamentally of organizing his ideas into unity and coherence. It goes without saying that he anticipated much that was independently discovered by others subsequently, e.g., the logistic thesis concerning the nature of mathematics, or the essential features of Poincaré's theory of applied geometry as a "convention." In addition, material more or less adequately treated in the preceding volumes of this edition, is restated and often amplified in both of the present volumes, so that a somewhat clearer light is thrown on such things as "fallibilism" in mathematics and the theory of signs. His comments on a variety of logical atomism are eminently worth reading, especially to-day. His defense of "infinitesimals" is provoking to say the least, even if not clear or convincing, and even if it seems to miss the point as to why the idea has been abandoned.

Volume IV consists chiefly of hitherto unpublished material on the foundation of logic and mathematics. Peirce anticipated the ideas expressed in Sheffer's stoke function, and the ideas as well as the use of the currently prominent matrix method. He made very full studies of the cardinality of classes, of the well-known contradiction, of orders of infinity, of linear algebras as instances of the general theory of relations; and his demonstrations have interesting, though sometimes uncritical, variations on the classic proofs. His judgment on the metaphysical importance of some of these studies seem now curiously unbalanced, e.g., the significance of the projective theory of distance; although anyone who has been exalted by that subject will surely forgive even an extended period of intellectual insobriety. His discussion of the logical priority of ordinal to cardinal number is particularly good and valuable, and ties up directly with the current *Grundlagenstreit* in mathematics. Also, little sermons on the value of logic, on how to read most profitably, on free will, on the issues of nominalism, and on the historical parallels between styles in architecture and types of logical theory, are to be found hidden away amidst technical discussions.

Peirce paid much attention to logical diagrams as instruments for the analysis of logical form, rather than as engines for calculation. And he regarded his Existential Graphs, a systematic scheme for representing geometrically any proposition however complex, as his *chef d'oeuvre*. A full account of it is included in Volume IV. But while the method is ingenious, and in many respects an improvement on the Euler and Venn diagrams, it is very clumsy; and it is difficult to attach to it the great importance which Peirce did. But perhaps the bearing of Existential Graphs upon Peirce's pragmaticism will become evident in later volumes.

All in all, Peirce's technical mastery of detail and his grasp of metaphysical issues as revealed in specific subject-matter are most impressively exhibited in this latest volume of the edition. It does not offer solutions to many pressing questions; it does not even ask some that one would like to ask. But it is a mine of suggestions to him who has the wit and patience to ferret them out.

The editors have worked *con amore* in preparing the text for the press, and the high standards they set themselves in the previous volumes have been continued in this. Reservations must be made concerning their judgment and good taste in some matters. Thus, as one instance, it is doubtful wisdom to place the contents of Book II, Chapter 4, of Volume IV after the contents of Chapters 1, 2, and 3. It is also a pity that all the Lowell Lectures are not to be published. I have noticed a few misprints. In Volume III, the third footnote on page 220 contains two misplaced vinculi; the equation on line 11 of page 326 is missing a variable x; "uncovered" in the footnote on page 359 should be "recovered." In Volume IV, Figure 17 on page 306 is incorrectly drawn; and the words in Figure 105 on page 367 should be inverted.

Collected Papers of Charles Sanders Peirce. Edited by Charles Hartshorne and Paul Weiss. Volume V, Pragmatism and Pragmaticism. Cambridge: Harvard University Press. 1934. Pp. xii + 455.

Of the volumes of the *Collected Papers* which have appeared thus far, the present one is undoubtedly the richest in historical importance, in diversity of material, and in veins of thought which still remain to be mined. It contains the long awaited Pragmatism Lectures, and presents in available form Peirce's weightiest papers on general philosophy – those published in the *Journal of Speculative Philosophy*. I know of no better way to reach the heart of Peirce's doctrines than to read the important essays published in Book II of the present volume. The papers in Book III discuss Peirce's relations to the philosophy of common sense, and contain many of his own views under the label of critical common-sensism.

The Pragmatism Lectures repeat with simplifications and some elaborations doctrines already familiar from the first two volumes of the present edition: the phenomenology of the universal categories, the theory of signs, and the analysis of reasoning into its three main types. Peirce's strong idealistic leanings become very apparent here as elsewhere; and his views on reflective thought as an instrument for establishing general modes of behavior (thus subordinating logic to ethics), are brought out clearly. But on the whole the Lectures are disappointing: they are repetitious, they lack integration, and they contain many irrelevant though often interesting by-paths.

With the possible exception of the technical papers on strict logic, Peirce's writings on the theory of meaning seem to me to contain his most substantial contribution to philosophy. According to him, pragmatism maintains that nothing is in the understanding unless it is first in the senses, that nevertheless perceptual judgments always contain an element of generality or hypothesis, and that therefore such judgments are simply limiting cases of abductive reasoning and so always subject to correction. Ideas are to be clarified in terms of overt, public behavior of things, not in terms of private data of sense or self-luminous abstracta. In this insistence upon the intimate connection between sense and reason as well as upon the denotative reference of all intellectual conceptions, lie the strength and the difficulty of the pragmatic account of meaning. It eschews claims to infallible cognitive powers and yet avoids a stultifying skepticism. It must be admitted that the ambiguities which appear in Peirce's hitherto published writings on the theory of meaning are not ironed out in the papers now published for the first time. And yet if Peirce had been taken as the standard expositor of pragmatism, the often dreary and fruitless polemics on the nature of truth during the first two decades of the present century would have been avoided, with undoubted profit to the clarification of ideas in various departments of thought. For by pragmatism Peirce understood a method of making ideas clear, a branch of logic and scientific method, not a cosmology or a metaphysic. That is why, in spite of his penchant for a form of speculative idealism, he will remain a stimulus and a guide to all students of philosophy whose passion is to understand rather than to legislate.

Kant's influence upon contemporary positivism is a byword. It is interesting nevertheless to read Peirce 's account of the indebtedness of his "proto-positivism" to the eighteenth-century thinker, and students of the history of ideas will find much in the present volume to repay their reading of it.

Collected Papers of Charles Sanders Peirce. Edited by Charles Hartshorne and Paul Weiss. Vol. VI, Scientific Metaphysics. Cambridge: Harvard University Press. 1935. Pp. x + 462.

Students of Peirce's writings who hope to find in the present volume a carefully worked out metaphysics will be disappointed by its contents. Most of the papers included in it appeared in Peirce's life-time, and while some of the hitherto unpublished material helps fill out lacunae, on the whole there is little in the volume which was not known before. Like the preceding volumes in this edition the present one is a curious mixture of grandiose cosmological speculation and penetrating analyses upon a variety of topics.

The volume begins bravely enough with a program for metaphysics of studying the most general features of reality. Peirce claims that the objects of metaphysical inquiry are open to observation in the same sense that the objects of science are, and he attributes the backward condition of metaphysics to the fact that it's leading professors have been theologians. It is perhaps this program and this claim that led the editors to choose the title of "Scientific Metaphysics" for the volume. However, while Peirce has many important things to say about the generic features of reality in his discussion of the categories, it is a Schellingian outlook which characterizes most of the volume. Peirce declares that "metaphysics has to account for the whole universe of being. It has, therefore, to do something like supposing a state of things in which that universe did not exist, and consider how it could have arisen." There follows the familiar tychistic-agapastic-synechism. Since Peirce believes that it is regularity which requires explanation, he tries to exhibit it as the product of evolution from the chance elements in the universe. His conclusion is that the only intelligible theory of nature is a form of objective idealism, according to which matter is effete mind, the habits of the latter becoming physical laws. An interesting feature in this cosmogony is that not only the actual universe but also the Platonic realm of forms is evolutionary in origin.

The best things in the volume, to my mind, are the specific analyses Peirce makes of such ideas as necessity, chance, space, time, infinity, and continuity, and the additional light that is thrown on his views on probability and the nature of science. In his discussion of continuity, Peirce occasionally approaches the standpoint of contemporary intuitionism, although he does not work out the implications of his views. However, even in his analyses Peirce is dominated by his evolutionary cosmology, not always in the interest of clarity or cogency. Thus, while Peirce did yeoman service in pointing out the contingent factors in the laws of science, he seems to me to obscure the issues when he transforms "chance" into a substantial *agent*. And while his attack on necessitarianism is impressive, I do not find that he offers any respectable evidence for his view that the "order of nature" is changing, or that these changes are brought about through the operation of a primordial "mind." Again, his ideas on space and time, when I can understand them, seem to me very naïve; and his conclusion that legal corporations have a "real" personality illustrates the tricks that words will play upon minds that should know better.

It is to be hoped that the remaining volumes of the *Collected Papers* will be published in short order. But enough of Peirce's work has now appeared to suggest the conclusion that a consistent system of ideas can not be forced upon him. He said different and incompatible things at different times, and there seems no way of reconciling his periods of forthright naturalism with the anthropomorphic idealism of other portions of his writings. Peirce characterized himself justly when he declared that he was "a mere table of contents, so abstract, a very snarl of twine."

PEIRCE'S THEORY OF QUALITY

John Dewey, "Peirce's Theory of Quality." *Journal of Philosophy* 32.26 (19 December 1935): 701–708.

The questions raised in Mr. Goudge's criticism of Peirce[1] on the nature of the "given," are of high importance in the contemporary state of philosophy in which the problems of the given, on one hand, and of universals and essences, on the other, bulk so large. The problems themselves far transcend, of course, the question of the internal consistency of Peirce's own views on the subject. But their importance also renders it highly important that Peirce's own contribution be correctly apprehended. Hence I propose to point out some fundamental misconceptions in Mr. Goudge's rendering of Peirce's ideas.

Peirce is considering, in the passages of which Mr. Goudge treats, phenomenology, or the matter of experience as experienced. While he introduces at times (and rather unfortunately in my opinion) his predilection for panpsychic metaphysics, he is not writing on a metaphysical or cosmological basis, but is giving a logical analysis of experience; an analysis based on what he calls Firstness, or sheer totality and pervading unity of quality in *every*thing experienced, whether it be odor, the drama of *King Lear*, or philosophic or scientific systems; Secondness, existentiality, or singular occurrence; and Thirdness, mediation, or continuity.

Now Mr. Goudge finds an inconsistency in Peirce's treatment of Firstness on the ground that the latter holds both that it is brutely given as qualities of feeling and that it consists of "logical possibilities or universals" (p. 538). Now I submit that a careful reading of Peirce shows (i) that when he uses the word "possibility" he means by it material potentiality or power, not logical possibility, and (ii) that he does *not* hold that Firstness as such, that is, as the given permeating total quality of anything experienced is, strictly speaking, even potentiality. I begin with the latter point. Mr. Goudge quotes the following: "Firstness...is perfectly simple and without parts.... The word *possibility* fits it."[2] Very unfortunately, Mr. Goudge terminates his quotation in the middle of the sentence quoted, and thereby omits a point that is necessary to the correct understanding of Peirce's point. Here is the passage as it stands in the

[1] *Journal of Philosophy*, Vol. XXXII (1935), pp. 533-544.

[2] Page 537 of Mr. Goudge's article; *Collected Papers of Peirce*, I, 531.

original text: "The word possibility fits it, *except* that possibility implies a relation to what exists, while universal Firstness is the mode of being of itself. *That* is why a new word was required for it. *Otherwise*, possibility would have answered the purpose."[3]

I am not suggesting that Mr. Goudge omitted the qualifying clause and the additional sentences in order to make out his point. Doubtless he thought them irrelevant. But they are not; they are the meat of the matter as far as quality as possibility is concerned. In his analysis, which is logical not psychological, of a phenomenon, of anything as experienced, he finds it necessary to consider Firstness, or the quality of an experience, both as it is in itself and as it is in relation to the other aspects of a phenomenon. What he is saying in the passage quoted is that while quality is possibility in relation to Secondness, or existence, it is *not* possibility in and of itself. Secondness, or existence, he defines elsewhere in terms of reaction and interaction, of resistance or brute self-assertion. It is actuality in the literal sense. It is also strictly individual. In reference to existence so defined, quality is both possibility and generality. A pervasive unity of quality is a condition to be satisfied in connection with the existential aspect of any phenomenon. Existence, he says, is "just when and where it takes place...and, therefore, different Secondnesses, strictly speaking, have no common quality."[4] But experiences do have common qualities; therefore Secondness is *logically* conditioned by quality. Generality does not belong to any phenomenon *in its occurrence*, but the *matter* of the experience gets generality because of co-presence of Firstness or total undivided quality. Quality or Firstness *per se* is neither individual nor general. But *as* the Firstness *of* Secondness it provides generality to the latter. Unless the fact is clearly recognized that Peirce deals with Firstness both by itself – indicating its denotation – and as the Firstness *of* Secondness (as well as of Thirdness) what he says is more than inconsistent. It has no point.

I come now to the other point. "Possibility" in isolation from a context is an ambiguous word. It means both logical possibility and material potentiality. While Peirce is concerned to indicate that quality is Firstness because it is a logical condition of what he terms existence (and of Thirdness, continuity or rationality), yet when he says "the word *possibility* fits it," he is speaking of power, of material potentiality, not of quality as logical possibility. This fact had been made clear by the time Peirce arrived at the passage quoted. As early as 422-425 (where he is expressly discussing quality) he makes this point evident in a fairly extended discussion from which I quote some typical passages. Quality

[3] Italics not in original text.

[4] *Collected Papers*, I, 532.

> is not anything dependent upon the *mind*. It is not anything which is dependent, in its *being*, upon mind, whether in the form of sense or thought. Nor is it dependent, in its being, upon the fact that some material things possess it. That quality is dependent upon sense is the great error of the conceptualists. A quality is a mere abstract *potentiality*, and the error of these schools lies in holding that the potential, or possible, is nothing but what the actual makes it to be.[5]

The concrete illustrations that Peirce goes on to use prove incontestably that his use of the word "potentiality" is not accidental. He criticizes those who claim that a thing does not have the *quality* of red in the dark, or that iron does not have the quality of resistance when not actually exerting pressure. "Do you mean to say that a piece of iron not actually under pressure has lost its *power* of resisting pressure?" (I, 422). This power is actualized only under conditions of interaction with something, but it is there as a power nevertheless. Quality *per se*, in itself, is precisely and exclusively, according to Peirce, this potentiality; it is like potential energy in relation to kinetic, the latter involving resistance and hence actuality or existence. "It is impossible to hold consistently that a quality only exists when it actually inheres in a body." A quality is what "*might* happen," and since every law, indeed every description of an event, involves something that *may* happen, but is not now happening, it involves quality as potentiality. The same analysis applies to generality. Capacity or power to resist pressure is actualized on particular or individual occasions. But *qua* power it is general, for it is a *way of* behaving. So he criticizes the nominalists for denying, by implication if not explicitly, that things have ways of being. In Peirce's scheme, the potentiality and generality he is talking about are so far from being "*logical* possibilities or universals" that they provide the cosmological or physical basis for logical possibilities and universals. Peirce's theory of "leading principles" as universals has no meaning except as a carrying over into the field of inquiry ways of behaving that are characteristic of things. What in my opinion is Peirce's most characteristic philosophical contribution, namely, his original theory of the relation between the existential and the logical, is wholly meaningless if it is not seen that he is speaking of possibility and generality as ways or modes that with respect to actualization are potential and general, being actualized only under individualized conditions of interaction with other things.

Peirce even goes so far as to question the generally accepted theory that such actualized qualities as those of different colors are connected simply with

[5] Italics mine. Compare with this passage a prior statement, 419, "The qualities, in so far as they are general, are somewhat vague and potential. But an occurrence is perfectly individual. It occurs here and now… . Qualities are concerned in facts but they do not make up facts."

quantitative differences of vibrations. They "will not make such a difference as that between deep vermillion and violet blue… . It is doubtless our imperfect knowledge of these vibrations that has led us to represent them abstractly as differing only in quantity," so that increased knowledge of electrons will enable us to find in them different ways of behaving, or potentialities, that correspond to different qualities of sense.[6]

It should now be evident that what Mr. Goudge thinks is an inconsistency consists simply of the fact that in his analysis Peirce takes Firstness, or quality, in two aspects; once as it is in itself and once as it is in relation to Secondness or existence, and that potentiality and generality attach to it exclusively and necessarily in the latter connection. Moreover, he gives the reader explicit notice that this is just what he is doing. He does it in the clause and sentences Mr. Goudge omitted, and he has done it earlier in the following passage:

> We see that the idea of a quality is the idea of a phenomenon or partial phenomenon considered as a monad, without reference to its parts or components and *without reference to anything else*. We must not consider whether it exists or is only imaginary, because *existence* depends upon its subject having a place in the general scheme of the universe. An element separated from everything else and in no world but itself, may be said, *when we come to reflect upon it*, to be merely potential. But we must not even attend to any determinate absence of other things; we are to consider the total as a unit.

And almost as if to guard against such a misconception as that of Mr. Goudge, he says:

> When we say that qualities are general, are partial determinations, etc., all that is true of qualities *reflected upon*; but these things do *not belong* to the quality-element of experience.[7]

Considered in itself, quality is that which totally and intimately pervades a phenomenon or experience, rendering it just the one experience which it is. Of course, then it is "ineffable." Mr. Peirce or any one can only call attention to it and invite others to note its presence in any and every experience they have a mind to take. When it is described, even when it is denotatively mentioned, there is another and new experience having its own, so to say,

[6] At this point Peirce brings in his panpsychic metaphysics. But he expressly calls his reference a *guess*, and in any case his logical analysis is independent of this particular metaphysical interpretation.

[7] I, 424, 425; italics mine.

totalizing unifying quality – and so on *ad infinitum*. When such quality is reflected upon in relation to existence, it is seen to be a potentiality and to be general. As Peirce points out, a quality does not *resist* while existence involves reaction and resistance. Hence the experience of anything purely imaginary, say, centaurs, has its own pervading and unifying quality, just as much as does that of horses in the barn. But this quality, while having no evidential value with respect to existence, is a condition of there being *any* experience and hence of an experience or phenomenon ("phaneron").

The distinction involved in the clause "or *partial* phenomenon" is also important. What is true of the experience of the drama of *King Lear* as a whole is true of every act, scene, and line in it so far as that experience has its own unity. It would be a complete mistake to confine the application of quality as Firstness to such things as red and hard and sweet, although it applies to them as partial phenomena. It is something which characterizes any and every experience subject-matter, as far as that experience has unity and totality, wholly independent of the complexity of its "components" and of the place of these components in the existential world. Hence where we recall a prior experience, the experience of recall is a new experience having its own pervasive unifying quality.

Up to a point, therefore, Peirce in what he says about ineffability and undescribability is simply generalizing the commonplace that in order to *have* red as a quality you have to have direct experience of it; that while a blind man can understand the theory of color and the place of what is designated red in the theory, red as an immediate quality can not be present in his experience. This is not a matter of dialectic or argument, but is something which is either so or not so, and the only way of finding out whether or no it is so, is denotative, not dialectical. In addition to generalization of the commonplace in question, he is saying that no matter how complex the constituents of any unitary experience and whether the constituents are existential or imaginary, the unity and totality of the experience is that of quality, and conversely.

When Mr. Goudge, then, says that quality or Firstness in Peirce is the *given* in the sense of being "broadly synonymous with the 'ideas' of Locke and Berkeley, the 'impressions' of Hume, the *Vorstellungen* of Kant, and the 'sensa' and 'presentations' of contemporary philosophy" he is far off the track.[8] It would be nearer the fact to say that he is engaging in deliberate, even if implicit, criticism of the basis and implications of all such theories. For he is pointing out that any *experience* of "ideas, impressions, sensa, presentations," etc., has its own unity, its own unique and unreduplicable quality. This statement holds, for example, of Locke's experiences when thinking and

[8] P. 534 of his article.

writing about *ideas* and of the experiences of any one reading Locke's *Essay* or reflecting upon it. Moreover, what are called ideas by Locke are taken by him to have *existence* (at least in or before the mind), and the whole point about *Vorstellungen* and *sensa* is that some kind of existence is attributed to them, whether psychical or otherwise. But, as the foregoing should have made evident, Firstness or quality is something in itself wholly independent of existence, the latter being a matter of "struggle," of action-reaction. Any problems that arise about ideas, impressions, etc., are in Peirce's theory affairs of *components*, of their place in the scheme of existence as determined by actual reaction and resistance. If what Peirce means by Firstness resembled in any way, to say nothing of being "broadly synonymous with," the givens of various modern philosophers, it would have been sheer nonsense to call them ineffable, or to apply to them any of the characterizations Peirce employs. But it is not nonsense to say that every experience which has Lockeian ideas or Humeian impressions for its subject-matter or components has its own quality, and that any description of this quality that may occur takes place in another and new experience having its own unity and totality of quality.

When Mr. Goudge suggests some rough similarity between Peirce's qualities and Santayana's sense-data as essences, he is following the same wrong road still further.[9] Anything that can be termed essence, meaning, subsistence, belongs in the domain which Peirce calls Thirdness. Similarly, when he discusses Peirce's view that quality as such is indescribable, he says: "Peirce's view that the act of describing must alter the *nature* of the given would entail a denial of the possibility of real knowledge, and is therefore self-contradictory," and uses the multiplication-table as an instance of the givenness in question.[10] It is completely overlooked that this conception of nature is a conception belonging to the domain of Thirdness, not of Firstness. It belongs, by description, to the domain of knowledge, while quality belongs to the domain of the occurrences of any single and total experience wholly irrespective of any cognitive or reflective reference. Peirce does not hold that the act of describing alters the quality of what is described, but that the experience occurring in an act of describing the quality of another experience, of the multiplication-table, or anything else, itself has another quality. The quality of the original experience has become a component of this further experience, which has its own quality. Quality, as Peirce says, is "first, present, new, initiative, original, spontaneous, free, vivid, conscious, and evanescent." But it is such just because it is of a different dimension from any content or component of either existent or rational objects.

[9] P. 543 of his article.

[10] P. 539 of his article.

I wish to add a few words about Peirce's *psychological* identifications and descriptions of Firstness, Secondness, and Thirdness, respectively. In this psychological universe of discourse, Quality (including sensations as barely *had* and not referred) represents feeling; Secondness represents existence as conative (since involving effort-resistance); and Thirdness, as cognitive thought, represents rationality. Now these psychological descriptions can be interpreted in two ways. As far as Peirce's panpsychic predilections are concerned, they are doubtless to be taken rather literally. That is, in his metaphysical cosmology Peirce was inclined to believe that *apart* from experience and phenomenology, the universe is constituted out of relations between something very like feelings and acts of effort-resistance, while natural continuity is inherently assimilable to what presents itself in experience as reflective thought. But, as I have already pointed out, his logical analysis of a phenomenon, or any experience, is logically independent of this cosmological interpretation, and stands or falls on its own merits.

Moreover, the matter in question is incapable of another interpretation. Whether "feelings," for example, are or are not constituents of the natural world, it can be affirmed that, *psychologically*, it is through feeling (including sensation as such) that qualities present themselves in *experience*; that it is through volitional experiences that existence, as a matter of action-reaction, is actualized in experience, and it is through thought that continuities are experienced. All that is required on the ontological side is that existence itself is qualitative, not merely quantitative, is marked by stress and strain, and by continuities. That much, but only that much, of ontological interpretation is postulated in Peirce's logical analysis of experience.

Mr. Goudge quotes a passage from Peirce which is highly significant in this connection: "Feeling is the true *psychical representative* of the immediate as it is in its immediacy, of the present in its direct, positive presentness."[11] This idea that feeling is the psychical representative of that immediacy of being which characterizes, according to Peirce, everything in the natural world, is all that is essential to his theory. The rest is supernumerary; as he repeatedly says, with unusual frankness for a philosopher, it is a *guess*. If what is suggested in such a passage is followed out, we do not define or identify quality in terms of feeling. The reverse is the case. Anything that can be called feeling is objectively defined by reference to immediate quality: anything that is a feeling, whether of red or of a noble character, or of *King Lear*, is of some immediate quality when that is present as *experience*. Personally, I

[11] *Collected Papers*, V, 44; italics mine. The passage as printed in Peirce makes even a closer connection with the Firstness of the passages taken from Vol. I. It actually reads as follows: "The quality of feeling is the true psychical representative of the first category of the immediate as it is, etc."

believe this to be sound doctrine. But whether it is or is not, it is all that is implied in Peirce's logical analysis. I do not wish to minimize Peirce's own inclination toward a pan-psychic interpretation which makes the immediate quality of *things* to be of the nature of feelings. But I do emphasize the fact, which he himself repeatedly emphasizes, that this interpretation is optional so far as the analysis of experience is concerned.

I do not profess, to end with a personal word, to agree completely with Peirce's analysis, for I do not think that I have fully mastered it. But I am quite sure that he, above all modern philosophers, has opened the road which permits a truly experiential philosophy to be developed which does not, like traditional empirical philosophies, cut experience off from nature, a road which if followed leads out of the impasse into which Locke's "ideas" and the contemporary theory of sensa and of essences alike conduct philosophy. For this reason, it is important that Peirce's theory should be understood for what it is.

THE PRAGMATISM OF C. S. PEIRCE

Justus Buchler. "The Pragmatism of Charles Sanders Peirce." *Psyche* 17 (1937): 92–131.

Peirce speaks on one occasion of critical common-sensism as a "consequence" of pragmatism (5.439), and says, on another, that "a pragmaticist, to be consistent, is obliged to embrace" critical common-sensism (5.499); he says also, on the other hand, "I have myself called pragmatism 'critical common-sensism'; but, of course, I do not mean this for a strict definition" (5.494). If we remember that "critical common-sensism" in Peirce maybe understood in a broad and a narrow sense, we should interpret these statements loosely, bearing in mind only that between critical common-sensism as understood in Part I and pragmatism as it emerges from the considerations to follow there is an intimate connection.[1] One might say that to accept common sense as the fundamental basis of knowledge is to accept a pragmatic analysis of meaning, but one might with equal justification say that to accept such an analysis is to accept common sense. We could say that the argument against purely demonstrative names, which underlies the argument against intuitive knowledge, depends to a certain extent on the pragmatic criterion of the meaning of these names; but from another point of view it might be sounder to say that the formulation of the pragmatic criterion is based on the nature of knowledge in general, and its communication in signs, and that an examination of the nature of knowledge refutes by itself the notion of purely demonstrative names.

Origin of Pragmatism. The word 'pragmatism' seems to have been first publicly used by James in the lecture "Philosophical Conceptions and Practical Results" of 1898. He there speaks of "Peirce's principle," "the principle of practicalism – or pragmatism as he called it, when I first heard him enunciate it at Cambridge in the early 70's."[2] The occasion to which James refers was probably one of the meetings of the "half-ironically, half-defiantly" named

[1] "Pragmaticism ... implies faith in common sense and in instinct, though only as they issue from the cupel-furnace of measured criticism" (6.480).

[2] *Collected Essays and Reviews*, p. 410.

"Metaphysical Club," formed by Peirce.[3] These meetings were attended by James, Chauncey Wright, Nicholas St. John Green, O. W. Holmes Jr., F. E. Abbot and John Fiske. It was at this Club that "I drew up," says Peirce, a little paper expressing some of the opinions that I had been urging all along under the name of pragmatism" (5.13). The paper expanded, five or six years later, into the two papers "The Fixation of Belief" and" How to Make Our Ideas Clear," appearing in the November 1877 and January 1878 issues, respectively, of the *Popular Science Monthly*. Although what later became known as the 'maxim'[4] of pragmatism was stated in the second of these papers, the word 'pragmatism' was not used by Peirce himself in print until 1902, when he contributed an article on the subject to Baldwin's Dictionary. He says that as late as 1893 he could have inserted the word in the Century Dictionary (for which he wrote many definitions) but refrained out of uncertainty that the extent of the word's usage justified it, as well as out of over-modesty (5.13, 13n.). James continued to ascribe the origin both of the conception and the word to Peirce notably in 1902,[5] 1904[6] and 1907[7]; and he quoted or referred to Peirce in various writings. Professor Perry holds it to be "clear that the idea that pragmatism originated with Peirce was originated by James." For "Peirce states explicitly, in his contribution to the Dictionary of Philos. and Psychol., 1902, that he derived his view from Kant."[8] Peirce does not, in fact, say that he "derived his view from Kant" but that he "was led to the maxim by reflection upon Kant's *Critique of the Pure Reason*" (5.3 or Baldwin's Dict., "Pragmatic and Pragmatism"), which is some what different. He repeatedly writes that of all philosophical classics he was virtually reared on that of Kant, and almost knew it by heart, in which case it would be small wonder that his reflections should take their point of departure from it. That his pragmatism was also positively influenced by Kant no one doubts; but then he himself says that the ancestry of pragmatism can be traced to Socrates; and if we are to

[3] Peirce's accounts of the date at which the Metaphysical Club was started and pragmatism introduced vary. See 5.12, 6.482, 6.490, and *Journal of Philosophy*, 1916, p. 719.

[4] "Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object" (5.402). It will be noticed that I make little reference to this maxim in what follows. As a statement made in 1878 it is justly famous; but it is a mistake to base a discussion of Peirce's pragmatism on it. Considered relatively to the whole of Peirce's writings it is one of a class of statements that are unprecise.

[5] *Varieties of Religious Experience*, p. 444.

[6] *Coll. Ess. and Rev.*, p. 448.

[7] *Pragmatism*, pp. 46–7.

[8] *Thought and Character of William James*, II, p. 407n6.

take his words in such matters seriously, there is almost no classical philosopher by whom he has not been positively influenced.[9] Professor Perry's opinion seems, therefore, to be correct only in the sense that pragmatism was not absolutely original with Peirce. No important conception is absolutely original; as Peirce says, "Any philosophical doctrine that should be completely new could hardly fail to prove completely false" (5.11). James's judgment, that Peirce "expressed in the form of an explicit maxim" what was implicit in certain previous philosophies, particularly in the "great English way of investigating a conception,"[10] is probably correct, though Peirce's explicit contribution was in its totality far more profound than the maxim of which James was thinking.

The immediate ancestry of pragmatism Peirce ascribed to members of the Metaphysical Club. He emphasizes particularly the influence of Chauncey Wright (5.12, 5.64), and Green he calls the "grand-father of pragmatism," for "he often urged the importance of applying Bain's definition of belief, as 'that upon which a man is prepared to act',"[11] from which definition "pragmatism is scarce more than a corollary" (5.12).

But already in the second of the 1868 papers Peirce says that the meaning or "intellectual value" of a thought "lies ... in what this thought may be connected with in representation by subsequent thoughts; so that the meaning of a thought is altogether something virtual" (5.289). And in 1871, in his review of Campbell Fraser's edition of Berkeley's Works, he offers a "rule for avoiding the deceits of language": "Do things fulfill the same function practically? Then let them be signified by the same word. Do they not? Then let them be distinguished."[12] These passages are rudimentary, but they touch the core, respectively, of the doctrine and the purpose of pragmatism.

The Purpose of Pragmatism. What did Peirce intend to accomplish by the formulation of pragmatism? In 1878 he intended it as a principle making for the clarification of 'ideas', and to this essential purpose he clung always, expressing it more fully as the years passed. He emphasizes that the clearness of ideas which his pragmatic maxim, then unnamed, is designed to attain is not clearness in either the Cartesian or the Leibnizian senses, which he regards as the two "grades of clearness" inferior to the pragmatic. The clearness which Descartes prescribed amounts to a psychological sense of agreeableness,

[9] One of Peirce's favorite classical ancestors of pragmatism is Berkeley (cf. 5.11, 6.482; Perry, II. p. 425). But he regards Spinoza (!) too as a prominent ancestor (cf. 6.490, 5.412).

[10] *Coll. Ess. and Rev.*, p. 434.

[11] Cf. Bain, *The Emotions and the Will*, 3rd ed. (1875), p. 505.

[12] *North American Review*, vol. 113 (1871), p. 469.

derived from introspection, and neglects the possibility that ideas which seem clear may in fact not be so. The 'distinctness' which Descartes further prescribed is intended to put ideas to the test of 'dialectic': they must remain clear when their consequences are examined, and in any context of discussion that they may enter. The Leibnizian criterion of distinctness emphasized the importance of abstract definitions. This requirement Peirce regards as important in setting beliefs "in order," order being "an essential element of intellectual economy, as of every other" (5.392). That Peirce himself was, incidentally, much concerned with this aspect of 'clearness' is shown by his considerable attention to the theory of terminology (Cf. 2.219–26, 5.413, 5.611). But the criterion of suitable abstract definition is hardly sufficient to guarantee that the members of a linguistic group should know each with relative precision what he is talking about and communicate unequivocally. This the pragmatic criterion is designed to achieve. (Cf. 3.457, 5.206).

Pragmatism "is, in itself, no doctrine of metaphysics, no attempt to determine any truth of things. It is merely a method of ascertaining the meanings of hard words and abstract concepts" (5.464). The most important application of the pragmatic method is therefore to philosophical inquiry. Suppose that two philosophers are engaged in dispute. The question which they are disputing, let us further assume, cannot be settled by appeal to the observation of facts. Yet each philosopher claims that the other is wrong, and moreover, claims to prove it. In such a situation, "pragmatism maintains that ... the disputants are at cross-purposes. They either attach different meanings to words, or else one side or the other (or both) uses a word without any definite meaning" (5.6). Plainly a method such as pragmatism is necessary "for ascertaining the real meaning of any concept, doctrine, proposition, word, or other sign" (*ib.*). Pragmatism "will serve to show that almost every proposition of ontological metaphysics is either meaningless gibberish ... or else is downright absurd" (5.423). The reason is that the words of traditional metaphysics derive their meaning *merely* from abstract definition: a term is defined by others, these by others still, without "any real conception ever being reached" (*ib.*). Peirce's pragmatism, then, is a criterion of the meaning of words and sentences. It is not a criterion which simply legislates for the sake of convenience or elegance what the meaning shall be, but which is based on the way in which words and sentences are actually used; Peirce intends to make precise the criterion of meaning implicit in the linguistic intercourse of all men; and by the use of this more precise and explicit criterion we should be able to say, not only in actually doubtful cases but in every case, whether a word or sentence is or is not meaningful. "After all," Peirce wrote to James in 1904, "pragmatism solves no real problem. It only shows that supposed problems are no real problems."[13] It will be observed that Peirce speaks

[13] In Perry, *op cit.* II, p. 430.

sometimes of the meaning of words or sentences and sometimes of the meaning of 'ideas' or 'concepts'. It is more general, and at the same time more accurate, to speak of pragmatism as a criterion of the meaning of *signs*. For a sign may be either a purely linguistic sign, under which we may class such things as words, algebraic notation and visual diagrams; or it may be a thought, i.e. a mental sign, which is at least quasi-linguistic.[14]

Now there are two limitations to the kinds of signs the meaning of which pragmatism professes to determine. The first of these limitations is only implicit in Peirce, but the second he emphasizes on more than one occasion. (1) So far as words are concerned, pragmatism determines the meaning only of non-logical words; that is to say, it applies only to *descriptive* signs or *names* (whether of qualities or relations) and does not apply to such logical words as 'and', 'not', 'if', etc. So far as sentences or propositions are concerned, pragmatism applies only to *synthetic* sentences. (2) Pragmatism, according to Peirce, ascertains the meaning only of "intellectual" signs, i.e. signs " upon the structure of which, arguments concerning objective fact may hinge" (5.467). Thus he says that pragmatism has nothing at all to do with the meaning of the names 'red' or 'blue', "for red and blue name mere subjective feelings only"; pragmatism has "nothing to do with qualities of feeling," and "could two qualities of feeling be everywhere interchanged, nothing but feelings could be affected" (*ib.*). Pragmatism indeed has nothing to do with qualities of feeling, which are incommunicable; but in excluding from its domain names like 'red' and 'blue', Peirce confuses a feeling with the name of a feeling, and he fails to see, moreover, that a name may be the name of a feeling and yet more than merely that. And not only does he exclude names like 'red' from pragmatic interpretation but also proper names "or other designation[s] of an individual object" (5.429). Here again he seems to confuse a proper name with a demonstrative pronoun (cf. 3.460), and would apparently regard the former as purely demonstrative if he so regarded the latter. (In contemporary terminology, he confuses a 'proper' name with a 'logically proper' name).

If limitation (2) to the scope of pragmatic definability should not be a confusion, then it affects limitation (1), and the latter becomes a more drastic limitation. But even if it should not be confused in itself, i.e. as a separate point, it would at least be inconsistent with Peirce's fundamental opinions. For it would be a genuine limitation only if proper names and names like 'red' were purely demonstrative. In being a limitation to the scope of pragmatism it would really be contrary to pragmatism; for purely demonstrative names

[14] "All thought whatsoever is a sign and is mostly *of the nature of language*" (5.421; my ital.) Also, "... the woof and warp of all thought and all research is symbols, and the life of thought and science is the life inherent in symbols; so that it is wrong to say that a good language is *important* to good thought, merely; for it is of the essence of it" (2.220).

are repugnant (as we have already in some measure seen) to Peirce's conception of knowledge, on which pragmatism is in a sense based. I believe, however, that not only on this point – i.e. the limitation of the pragmatic criterion to 'intellectual' signs – but on others Peirce suffers from confusion rather than from serious internal inconsistency.

What is an Interpretant? Something can be called a 'sign' only when it has an 'object' and an 'interpretant'. But it must be pointed out that Peirce's various definitions of 'sign' contain a number of different emphases, depending upon what he has in mind in the place of discussion. Consequently, the definitions of 'object' differ, and so do, especially, the definitions of 'interpretant'. What is the most general statement of the sign-relation, the triadic relation of representation? We cannot say, for instance, that by 'object' Peirce means the extension of a sign, since that is what he means (or can mean) only in the case of names; nor can we say that by 'object' he means the 'referend' (as it is called today), for while a name or a map has a referend, we should ordinarily not say that the sign 'the' or the sign which we call an analytical inference has a referend. A case can easily be made out for such 'signs' as the pointing of a finger or a weathervane as having extension, namely, the thing pointed to or indicated. But in general it seems clear that while perhaps every name, including, if we must, the 'natural' signs and demonstratives, has extension (Peirce prefers Hamilton's term 'breadth' to 'extension'), not every sign has. Thus, contrary to Peirce's analysis, which holds that every sign is part of a triadic relation, it would seem that certain signs either do not have an 'object' or have one in a rather strained sense. If we turn to 'interpretant', the case would seem to be different: 'interpretant' *would* always seem to mean 'depth'. According to Peirce, in order that a sign should be a sign, it must have an explanation (2.230), a translation (5.594, 5.427), an interpretation (5.569) – in brief, an interpretant. it is rather important to emphasize that by 'interpretant' we mean 'possible interpretant'. "It is not necessary that the interpretant should actually exist"; an interpretant "*in futuro* will suffice" (2.92). So that every term, logical or non-logical, every proposition, synthetic or analytic, every inference, would seem to have an interpretant, whether in the form of a definition (actual or possible) or a consequence (actual or possible). But if 'interpretant' as applied to all terms (and logical plus non-logical terms constitute, after all, the whole of any proposition or inference) is synonymous with 'depth' it follows that no sign is purely demonstrative. This is the internal evidence. We have yet to consider Peirce's explicit utterances on the matter. Deferring them to the next section, let us make certain points that will be useful.

(1) We may distinguish, in Peirce, between psychical signs and non-psychical (or non-mental) or 'external' (5.569) signs. A psychical sign is a thought or cognition; an external sign is a written word, gesture, or other

physical instrument of representation. We may divide the external signs into linguistic signs on the one hand and 'natural' signs or 'physical symptoms' (3.361) on the other. Now Peirce holds, in many places, that the interpretant of a sign is 'mental'; or he often uses 'interpretant' as synonymous with 'thought' (e.g. 2.315, 2.274). Does he mean that every interpretant is a psychical sign, that is, an actual thought or cognition? May not the definition of a word be a linguistic formula, or the interpretant of a proposition another proposition? What Peirce means is that every sign must ultimately have significance for a mind (cf. 2.242, 2.274). And he sometimes speaks, not only of an interpretant but of an *interpreter* (e.g. 4.536). An interpretant implies an interpreter: every sign must ultimately have an interpretant that is a mental interpretant. Every sign, in other words, must have a translation or interpretation which is meaningful only to some mind.

(2) The concepts of interpreter and interpretant are capable of generalization. We may regard the 'interpreter' as the *system* in which a given set of signs occurs, the notion of a system implying rules or conventions both for the number and type of signs that will be admissible, and for the translation or transformation of a given sign into others. We may regard the 'interpretant' as the definition or translation of any sign within the system. The interpretant of a sentence is the class of its consequences, and any term is definable by means of the primitive terms of the system; the primitives too have an interpretant, both in the sense that they *could* be defined and in the sense that they are implicitly defined by the axioms in which they occur. Peirce perhaps suggests this generalization by referring to the interpreter as the 'quasi-mind' (4.536). But I believe he would insist that however generally the notions of interpreter and interpretant are understood, we must ultimately fall back, in order to give significance to the sign-relation, upon an interpreter that is a mind and upon an interpretant that is a thought in this mind.

(3) We saw that in so far as a sign is thought it is judicative, i.e. is a tacit assertion. In view of the fact that some signs are merely linguistic, and are, moreover, mere terms, does this require modification? It might seem that the definies of a definition could remain a non-assertive set of signs, even if thought. But in fact, such a sign, when interpreted by a mind, would, on the view of Peirce, be interpreted in an assertion. Most significant, however, is the fact that Peirce regards every linguistic sign (and probably, although on this I am not sure, every sign – cf. 2.264) as, if not actually assertive, tacitly assertive, or 'rhematic'. Peirce's term 'rheme' is the equivalent of what is now called a 'propositional function'. (Cf. 2.340–1; 4.438, 4.354; 2.250, 2.264). A rheme is an incomplete predication. Ordinarily a proper name, for instance, is not regarded as a predicate or propositional function. It is not a 'rheme'. But it may nevertheless be regarded as *rhematic*, in the sense that it must ultimately be interpreted as occurring in, and forming a definite part of, some assertion.

(4) The interpretant of a sign, being always itself a sign, whether a psychical or linguistic translation, is also a sign of the same object and is translatable by another interpretant. This may in turn be regarded as a sign of the same object, etc. Thus every sign has an indefinite number of interpretations, each a sign of the same object.

Now our account of how 'interpretant' is to be understood would be altogether satisfactory if it were not for the fact that Peirce distinguishes *three kinds* of interpretants. Our account of the interpretant as being a translation in terms of signs, of signs which interpret a given sign, has taken no cognizance of two other 'kinds' of interpretants. We shall see shortly that this threefold distinction is what underlies the distinction between 'intellectual' signs, of which pragmatism defines the meaning, and non-intellectual signs, with which pragmatism supposedly has nothing to do.

To cover the following threefold distinction, the most general sense of 'interpretant' would have to be, not 'depth' or 'consequence', but 'significant effect' (5.475). There are three kinds of interpretants or significant effects which a sign may produce in the interpreter (cf. 5.475, 4.536). There is, first, the 'emotional interpretant', which consists in a feeling produced by the sign. Every sign, whatever else it produces in the interpreter, produces some sort of feeling. But in particular, "there is almost always a feeling which we come to interpret as evidence that we comprehend the proper effect of the sign." This feeling is, then, a kind of 'feeling of recognition'. In many cases this feeling or 'emotional interpretant' is the only 'significate effect' which the sign produces. "Thus, the performance of a piece of concerted music is a sign. It conveys, and is intended to convey, the composer's musical ideas; but these usually consist merely in a series of feelings." So that the sign known as a musical performance has only an emotional interpretant. A second kind of significate effect may be produced by a sign "through the mediation of the emotional interpretant, and such further effect will always involve an effort." Peirce calls this the 'energetic interpretant'. He instances the command "Ground arms!" as having an energetic interpretant. In this instance the effort excited by the sign is a muscular effort, but it may be and in fact usually is, he says, no more than a mental effort. The third kind of interpretant – which we have hitherto identified with 'interpretant' in general – is the 'logical interpretant'. The logical interpretant of a sign is not a feeling or effort excited by it but *another* sign, a thought, which is a translation in the proper sense of the word. 'Intellectual' signs alone, on the view of Peirce under consideration, have logical interpretants. (The quotations in this paragraph are all from 5.475).[15]

[15] The three 'interpretants' are, in the only other place where they are distinguished (4.536), called 'immediate', 'dynamic' and 'final' interpretants, respectively. These terms are taken for granted in correspondence of 1909 with Lady Weiby (printed in Ogden and Richards, *The Meaning of Meaning*, Appendix D, sec. 6).

Peirce's 'Limitation' of Pragmatism: On Purely Demonstrative Signs. The conception of other than logical interpretants appears in two of Peirce's writings, both of 1906. This is a very late date in his literary career, and one cannot help feeling that the crowded terminology with which the later papers are laden breeds confusion in his thought, making for views very unlike those earlier emphases we have encountered. But it is not necessary to rest with a mere conclusion that Peirce is inconsistent. On the contrary, the proper judgment should be that there are two emphases in Peirce, one fundamental, the other not. With respect to the concept of 'interpretant', it can be shown, I believe, that the great majority of Peirce's uses of this word regard it not as any 'significate effect' of a sign but as another sign interpreting or translating the first.[16] But more conclusive is the fact that upon this sense of interpretant depends Peirce's whole conception of the character of thought or knowledge. While the distinction between three kinds of possible significate effects is a sound one in itself (for the distinction between feeling, the sense of duality and cognition, on which it is based, is essentially sound), the terming of two kinds of significate effects 'interpretants' is misleading and infelicitous (just as it would be misleading to call 'feelings', and instances of the 'sense of duality', 'kinds of cognition'). By 'interpretant' Peirce should have meant 'logical interpretant'; from which it follows that a sign which has *only* an emotional (or energetic) 'interpretant' ought not to have been called a 'sign'. "A sign is not a sign unless it translates itself into another sign in which it is more fully developed.... Thought must live and grow in incessant new and higher translations, or it proves itself not to be genuine thought" (5.594).

Let us return to Peirce's opinion that the names 'red' and 'blue' are not 'intellectual' signs. He says: "The qualities of hard and soft strikingly contrast with those of red and blue; because while red and blue name mere subjective feelings only, hard and soft express the factual behaviour of the thing under the pressure of a knife edge" (5.467). 'Hard' is thus presumably an 'intellectual' sign, with a logical interpretant, but 'red' is a sign the 'meaning' of which is given by a feeling which the name suggests. In order to explain what 'red' means we do not give an abstract description but rather excite the feeling-quality which it denotes. 'Red' therefore has only an emotional interpretant; pragmatism cannot undertake or pretend to give the meaning of such a sign. Does Peirce mean that 'red' is purely demonstrative, that it has a denotation but no depth? On the internal evidence, derived, as we said, from Peirce's general theory of signs and of knowledge, there should be no purely demonstrative signs. What are Peirce's explicit statements on the matter?

Demonstrative pronouns, which are as likely to be purely demonstrative as any linguistic sign, are classed by Peirce as 'indices', signs which have some physical relation or other to their objects. Thus a demonstrative pronoun (or

[16] E.g. 1.542, 2.94, 2.228. 2.242, 2.303, 5.569.

adjective) 'calls attention' to a physical object. An index may be a non-linguistic (i.e. a 'natural') sign, for instance, a weathervane, a pointing finger, or fever as an index of illness. The question is whether Peirce regards any sign as a *pure* index, a sign purely denotative. We could of course make a catalogue of every reference by Peirce to the word 'index', but that would be futile and devoid of clarity. Let us choose one or two references which we can be assured are deliberate and fully conscious. In his definition of 'sign' for Baldwin's Dictionary, Peirce says: "An index is a sign which would, at once, lose the character which makes it a sign if its object were removed, but would not lose that character if there were no interpretant. Such, for instance, is a piece of mould with a bullet-hole in it as a sign of a shot; for without the shot there would have been no hole; but there is a hole there whether anybody has the sense to attribute it to a shot or not" (2.304). Is Peirce saying that an index may possibly have no interpretant and thus be a pure index? Not at all. He is not saying that an index may *function* as a sign without an interpretant, but that it would retain its *character as an index*, its factual or physical connection with an object (cf. 2.285–6, 2.299). (He is thinking here mainly of 'natural' or non-linguistic indices). The sign 'horse', which Peirce calls a 'symbol', or sign in virtue of its establishment by convention, would not retain its character as a symbol without an interpretant, though it would retain this character even if its object did not exist. All this is clear from a passage in another definition for Baldwin's: "Of course, nothing is a sign unless it is interpreted as a sign; but the character which causes it to be interpreted as referring to its object may be one which might belong to it irrespective of its object and though that object had never existed, or it may be in a relation to its object which it would have just the same whether it were interpreted as a sign or not" (2.308). And finally, in the definition of 'index' for Baldwin's, Peirce says: "It would be difficult if not impossible, to instance an absolutely pure index..." (2.306). As a kind of addendum, we should not overlook the fact that at least in his diagrammatic classification of all signs (cf. 2.264) Peirce regards every sign not actually assertive (i.e. not propositional or argumentative) as being rhematic, that is (as I believe Peirce's views imply), interpretable from the point of view of the position it would occupy in an assertion.

'Red', then, if indexical, is not purely indexical. Why Peirce should have considered 'hard' and 'soft' as expressing the factual behavior of a thing, and 'red' and 'blue' as not, is a little difficult to understand. For on other occasions it must surely have been evident to him that 'hard' and 'soft' likewise *may* be regarded as denoting qualities of feeling – as in fact they commonly are. 'Red' and 'blue', 'hard' and 'soft', all of them do have feelings as significate effects, as have other signs in varying degrees. But 'red' and 'blue', if they are to be regarded as signs and not mere causes producing mere effects, are pragmatically definable, in physical definitions, no less than 'hard' and 'soft'. And what

of proper names? They certainly are not *ordinarily* defined pragmatically, and in fact even less commonly than 'red' and 'blue'. But they are pragmatically *definable*; and if they were not we should have no instrument by which to discriminate the use of a proper name like 'King Henry V' from the use of a name like 'The Absolute'. Peirce's conception of 'intellectual' signs is thus confused. All signs are definable, and only logical signs are exempt from the pragmatic criterion of meaning. Pragmatism does not pretend to deal with the *feeling* of red, nor with any feeling whatsoever, but it does deal with the *name* 'red', and lays down a rule for defining it as it does for all other names (descriptive signs). So that we may assume only the one limitation to pragmatism that we mentioned above. And we may repeat that Peirce is not radically inconsistent in this matter. He himself can be found to explicitly substantiate the foregoing interpretation: "To say that a body is hard, *or* red, or heavy, or of a given weight, *or has any other property*, is to say that it is subject to law and therefore is a statement *referring to the future*" (5.545; my ital).

General and Special Analyses of Meaning. We may distinguish two kinds of usage of the word 'meaning' in Peirce. One is more general than the other. In the general sense 'meaning' is a relation, and none other than the sign-relation, which is triadic. This relation (to repeat what will bear repetition) involves a sign considered materially, its object, and thought (more accurately, some interpreter's mental interpretant, ultimately involved in all representation). 'Meaning' in the general sense, that is, the sign-situation, is an important presupposition of pragmatism. Signs cannot be said to have a meaning in a special sense apart from their relation to some interpreter's conception. In this general sense, then, we understand by 'meaning' the meaning-situation or -relation, or conditions under which a sign has meaning in a special sense to be explained.

Now many analyses of the 'meaning of meaning' fail to take into consideration the meaning-relation, and they are therefore inadequate; but they are not illegitimate, for they aim to define 'meaning' in a more special usage. We ordinarily, when we speak of the 'meaning of a sign', do not intend to speak of the meaning-relation even though we may be aware of it as underlying the use of signs. What we intend to speak of when we use the expression 'meaning of a sign' may, for example, be a referend; or it may be a definition, or whatnot. Peirce's pragmatism assumes that we refer to the definition when we speak of a sign's meaning; that is, to the logical interpretant. But, of course, anyone can say that by 'meaning' (in this special sense) we mean 'definition'; the question is, What *kind* of definition; and it is this which pragmatism answers. But before we go into detail we must convince ourselves that Peirce does use 'meaning', in the special sense, as logical interpretant. ('Logical interpretant', as we have indicated, is a wider term than 'definition', covering

translations of propositions as well as of terms). If we examine the actual text of Peirce we find not one but three special senses of 'meaning'.

(1) "A meaning is the associations of a word with images, its dream exciting power" (4.56). This statement, fraught with an emphasis against which Peirce himself inveighed repeatedly, may safely be considered a casual and unimportant one. He knew well that no word has the same image-associations for any two persons, and that such a view was unduly psychological. But in view of the fact that Peirce speaks of the emotional interpretant, the present statement is instructive in showing how in spite of himself he sometimes was tinged with a strain of psychologism in matters logical.

(2) Two other passages in Peirce require explanation. (*a*) The first is 2.293, where he speaks of "the object of a symbol, that is to say, its meaning." (*b*) The second is 1.339, where he does nothing less than distinguish between the 'object' of a sign, its 'interpretant' and its 'meaning'; and calls the 'object' a 'representation'.

The most likely explanation of these passages – and by 'explanation' we mean primarily explication – is to be found in a distinction of Peirce between the 'immediate object' and the 'dynamic object' of a sign (4.536). The dynamic object of a sign is its object in the familiar sense: it is the actual thing or fact to which the sign applies, its referend, or what it denotes. The immediate object, on the other hand, is itself a sign. Peirce is very vague on the concept of 'immediate object' and says little about it.[17] An objection at once arises, namely, if the immediate object is a sign, then would not a sign and its immediate object be mutually translatable, and are not mutually translatable signs 'interpretants' of one another? Peirce's own explanation of the immediate object as "the Object as the Sign itself represents it, and whose Being is thus dependent upon the Representation of it in the Sign" (4.536) – is too obscure to be speculated upon. There are, however, two explanations which seem plausible. (i) If we think of signs standing in temporal relation to one another – in other words, of the series of cognitions – then a cognition *B* which precedes a cognition *C* may be regarded as the latter's immediate object (both having the same dynamic object). *B* may in turn have an immediate object, *A*, preceding it, and *C* would be its interpretant. And so on. A distinction between interpretant and immediate object would thus be based on temporal order; and it would be accurate to say that relatively to different cognitions a given cognition is both interpretant and immediate object. (ii) If we consider, not thoughts but linguistic signs generally, 'immediate object' may still be regarded as a relative conception, understood, however, in terms of greater specificity of translation rather than of temporal priority. With respect to a term, the immediate object would be the denotation expressed in signs. Thus, the immediate object of 'man' would be 'Jones', 'Brown', etc., or in general, the class of proper names whose dynamic objects

[17] See correspondence in Ogden and Richards, *op. cit.*, p. 289; also, 2.293n.

are actual men. This would be distinct from the interpretant, which would be, e.g., 'bipedal animal, etc'. But a proper name, which is an immediate object relative to 'man', might itself be an interpretant relative to a more specific spatio-temporal designation. And so on. (The temporal series of thought-signs would not seem to require preceding thoughts to be more specific denotatively, though this is likely to be the case when the series as a whole is young).

To return to passages (*a*) and (*b*), in (*a*) Peirce uses 'meaning' as *immediate* object; in (*b*) he uses 'object' as immediate object, 'meaning' as the logical interpretant in so far as it is the conventional (customary) linguistic definition or translation, and 'interpretant' as the logical interpretant in so far as it is a cognition or actual mental translation.[18] Having made the senses of these usages clear, we can see without much difficulty that 'meaning' is used loosely, in contexts where it is not the main term and where no great harm results from its being used synonymously with concepts like 'interpretant' and 'immediate object' that differ only relatively.

(3) Peirce's real view is that 'meaning' in its special sense is synonymous with 'logical interpretant'. "Meaning is, in its primary acceptation, the translation of a sign into another system of signs...." (4.127). "The meaning of a sign is the sign it has to be translated into" (4.132). "By the *meaning* of a term, proposition or argument, we understand the entire general intended interpretant...." (5.179). The meaning of a proposition, for instance, would be the class of its necessary consequences (cf. 5.165).

The meaning of a sign is its logical interpretant. But we only begin the problem. A logical interpretant, being another sign, has itself a logical interpretant, and so on. Which of these is the 'meaning' of a given sign? In the case of a term, the logical interpretant may be nothing more than an abstract definition, and we may never reach "any real conception" (5.423) in this process of defining. And likewise in the case of propositions, to say that the meaning of a proposition is the set of its consequences is valuable only "as the beginning of an analysis of what the meaning of the word 'meaning' is" (5.165). For every proposition, whether logical or synthetic, has consequences, deduced in accordance with rules or leading principles. It is only a certain *kind* of consequences that will distinguish a synthetic from a logical proposition, and, most important for our purpose, a genuine or meaningful synthetic proposition from one that is pseudo-synthetic or meaningless. Hence while the foregoing analysis of meaning as the logical interpretant has been necessary, "it is by no means sufficient to cut off all nonsense" (5.179). We require a formula for a certain kind of logical interpretant, and this is supplied by pragmatism.

[18] Peirce says here (i.e. 1.339) that the series of objects of a sign (like the series of its interpretants) is infinite. That is – I take it – there is no limit to specificity in the successive series of signs called 'immediate objects'.

The Pragmatic Criterion of Meaning. I believe it is desirable to separate Peirce's enunciations of pragmatism into two classes. On the one hand, we may extract from him a statement of pragmatism the language of which is modern and invites comparison with current discussion along similar lines. On the other hand, there is a different kind of statement of pragmatism, less clear, motivated by the strong influence on Peirce of classical philosophic tradition as well as by his preoccupation with the mushroom pragmatism that sprang up in the neighborhood of 1900. In this second class of utterances Peirce's pragmatism speaks, among other things, of an 'ultimate' logical interpretant as being the meaning, and states what this ultimate interpretant is. I do not believe that the notion of an 'ultimate' interpretant is required for a statement of Peirce's pragmatism. In such a statement we need only emphasize that the meaning of a term or proposition is given by a definite kind of logical interpretant, and specify what that is. In this and the next section I want to proceed with such a statement.

Consider any term.[19] The meaning of this term is given by an expression mentioning certain properties. This translating expression or logical interpretant will be equivalent to the original term. But the properties mentioned by it will not be any properties. They will be sensible properties. Pragmatism holds that a term has meaning if, for any statement in which it occurs, another statement about sensible properties is always substitutable. A term has meaning, in other words, if it is definable by other terms describing sensible properties. The way in which, genetically speaking, these other terms, which may not in turn be thus defined, acquire meaning, is by being *associated* or *correlated*, in their usage, according to empirical convention, with such properties. Thus the term "hard" is a meaningful term because it is equivalent to the expression "not scratchable by many other substances" (cf. 5.403). But it is somewhat misleading to speak merely of the meaning of terms, as if terms could have a meaning apart from their possible employment in a proposition. Let us continue, in the manner just suggested, to speak of the meaning of terms-occurring-in-statements. Then we may say that the term 'hard' is a meaningful term because the statement (e.g.) "This is hard" is always interchangeable with the statement (e.g.) "This will not be scratched by many other substances." It may be held that by speaking of terms in this manner we can say *whether* a term *has* meaning or not, but not what the meaning of a term *is*. Such an objection, if not properly qualified, is likely to suggest a hypostatic conception of meaning that is not Peirce's, despite an impression sometimes given by his words. When we say that pragmatism "gives the meaning" of terms and propositions, we should be understood as saying that pragmatism states the conditions under which a term or proposition can legitimately be

[19] 'Term' will hereafter be understood to mean 'name'; 'proposition' to mean ' synthetic proposition'.

called meaningful, not that pragmatism labels an entity 'the meaning'. If we do speak of "the meaning" we refer to a logical interpretant of a certain kind (which we have just begun to describe); 'the meaning' of a proposition will be a certain kind of equivalent formula; 'the meaning' of a term will be an equivalent expression. Pragmatism will be the view that terms or propositions are meaningful if they have logical interpretants of a certain character; or in the other way of stating the matter – not objectionable if we remember the caution against hypostasis – the view that 'the meaning' of terms or propositions 'consists in' a certain kind of logical interpretant.

We were saying that the statement containing the translating expression of a term occurring in a given statement was one that asserted something about 'sensible properties'. This is not specific enough, and although we cannot be as clear as we should like until we speak of the meaning of propositions in addition to that of terms, we may nevertheless move another step forward. Suppose we ask, to choose a good example of Peirce, What is meant by 'lithium'? An ordinary definition might say, It is that element which has an atomic weight of nearly 7. But according to pragmatism, the meaning of 'lithium' is given in some such statement as the following:

"If you search among minerals that are vitreous, translucent, grey or white, very hard, brittle, and insoluble, for one which imparts a crimson tinge to an unluminous flame, this mineral being triturated with lime or witherite rats-bane, and then fused, can be partly dissolved in muriatic acid; and if this solution be evaporated, and the residue extracted with sulphuric acid, and duly purified, it can be converted by ordinary methods into a chloride, which being obtained in the solid state, fused, and electrolyzed with half a dozen powerful cells, will yield a globule of a pinkish silvery metal that will float on gasoline; and the material of *that* is a specimen of lithium'. (2.330).

This is not an abstract definition, or *mere* interpretant. It is, as Peirce says, a 'precept'. "It tells you what the word lithium denotes by prescribing what you are to *do* in order to gain a perceptual acquaintance with the object of the word" (*ib.*). The pragmatic criterion holds that to predicate any term of some object "is equivalent to declaring that a certain operation ... if performed upon that object, would ... be followed by a result of a definite general' (5.483). We can now be a little clearer as to what kind of reference to sensible properties is contained in the logical interpretant of 'lithium' or of 'hard': it is a reference to a definite *operation* leading to a definite *sensible result*. A predicate is a meaningful predicate if (and only if) it is definable in terms of a type of sensible result following a type of operation upon that of which it is predicated. And any statement that contains a meaningful predicate is nothing less than a kind of *rule*. For the statement to which it is equivalent asserts that when a definite operation is performed, a definite sensible result follows. This is nothing but a rule or formula or 'precept' for gaining 'perceptual acquaintance'.

Peirce's emphasis on 'precept' and 'operation' is in effect an emphasis that meaning is something *public*. We properly explain the meaning of a term to someone not by eloquently attempting to evoke familiar images in his mind but by prescribing how he can "gain perceptual acquaintance" with what the word denotes. The appeal is not primarily to imagination but to tests that can be undertaken by everybody. All sorts of images and feelings are associated with any term or proposition thought about, but we must not "mistake a mere sensation accompanying the thought for the thought itself" (5.401). Thought can be expressed only in language; and since language (understood as inclusive of 'natural' signs) is the instrument of social communication, it is successful to the degree that what it conveys is publicly intelligible. And we employ it successfully if we define our terms on the basis of publicly observable operations. The meanings of our words, that is to say, are established by correlating these words with what is repeatable and universally observable. But it must be emphasized that it is not the correlation of a term with the sensible merely as sensible on which Peirce's pragmatism insists. It is with the sensible in so far as it is public, and this is why we speak of the sensible in so far as it is the result of operations. Such a sensible result is "of a definite general description"; the merely sensible (or 'sensuous'), on the other hand, is private, variable and of a particular quality. James, who preached that terms must have sensible import, neglected (perhaps intentionally) this consideration. His purpose was simply an appeal to the concrete as a wholesome influence in philosophy, and the distinctions implicit in Peirce's pragmatism could never win his interest or seem to him very important. But for Peirce these distinctions were necessitated by his analysis of knowledge, which convinced him that in a criterion of meaning it was not sufficient to turn merely to the concrete but to the concrete in so far as it is public.[20]

From the pragmatic analysis of terms to that of propositions it is evidently no great step, and we have remarked that to deal with the meaning of terms is at least tacitly to deal with that of propositions. In Peirce there is virtually no stress on a distinct treatment of the two; he does not say explicitly that the pragmatic analysis of propositions is subordinate to that of terms in some such respect, for instance, as this: a proposition is a genuine synthetic proposition because all of its (non-logical) terms are conventionally associated with empirical properties. But something of the sort is implied by his analysis. For he wants to say that a proposition has meaning only if its necessary consequences, which constitute its logical equivalent, can be experimentally inves-

[20] "Man is not whole as long as he is single ... he is essentially a possible member of society. Especially, one man's experience is nothing, if it stands alone. If he sees what others cannot, we call it hallucination. It is not 'my' experience, but 'our' experience that has to be thought of; and this 'our' has infinite possibilities" (5.402n).

tigated. A proposition of metaphysics also has a set of necessary consequences, none of which may be thus investigable. That a proposition does have experimental consequences is due to the fact that the descriptive terms occurring in it satisfy the pragmatic criterion.

The Criterion with Respect to Sentences. Any synthetic proposition is 'admissible', according to Peirce, "... provided it be capable of experimental verification, and only insofar as it is capable of such verification. This is approximately the doctrine of pragmatism" (5.197). The pragmatic method is, after all, "no other than that experimental method by which all the successful sciences (in which number nobody in his senses would include metaphysics) have reached the degrees of certainty that are severally proper to them today" (5.465). What is it to say that a proposition is 'admissible' or 'inadmissible'? Since pragmatism is a theory of meaning, an 'inadmissible' proposition is a meaningless proposition. So that by the statement just mentioned, correctly termed 'approximate', since we must explain more fully the sense of 'verify', a meaningless proposition is one that is unverifiable. Every sentence must have, not merely consequences, but consequences the truth or falsity of which can be examined by experimental methods. The pragmatic criterion of meaning is implicit in the method of science. Any sentence means, to the scientific investigator, "that if a given prescription for an experiment ever can be and ever is carried out in act, an experience *of a given description* will result...." (5.411; my ital). A proposition, then, is meaningful if it is verifiable. Roughly we could say that according to pragmatism every synthetic proposition must be understood in terms of experience. But 'experience' is a treacherous word, and the pragmatic criterion might easily be abused to such an extent that any proposition of traditional metaphysics would be forced into harmony with it. If pragmatism is to be explained by means of the word, it must be public experience that we speak of, consisting of public operations, and public in the sense that scientific experiment is. With this qualification of the meaning of 'experience', the argument that propositions of transcendental metaphysics are 'experiential' though not in the sense of the word assumed by natural science, could not arise.

What is it that Peirce does not intend to imply by his pragmatic criterion of verifiability for propositions? By 'verifiable', first of all, he does not mean 'conclusively verifiable'. The pragmatic criterion does not assert that in order for a proposition to be meaningful it must be possible to either verify or refute that proposition once for all. If only those propositions were deemed meaningful which could be known conclusively to be either true or false, then by the principle of fallibilism no proposition at all would be meaningful, and certainly not the general hypotheses of natural science. No experiment by which we gather evidence for (or against) a hypothesis is isolated and completely independent. When we speak of 'an experiment' we mean not

literally a single experiment but a *collective* experiment, consisting in fact of a series of operations connected with one another (5.424). Pragmatism holds that a statement is meaningful if it is possible to gather evidence for or against it, not, if we can know definitely and precisely under what conditions it is true and under what conditions it is false. A conclusively verifiable sentence would be an atomic or intuitive sentence, and most of the sentences that we use are more general than perceptual judgments, which alone might be deemed atomic. But pragmatism does not even require all statements to be ultimately resolvable into atomic statements, or as we should say today, to be truth-functions of atomic statements.[21]

The proposition which gives the meaning of another, i.e. the logical interpretant which pragmatism calls the meaning, is *general*. It is a formula, stating that *whenever* certain operations are performed certain results follow, and these are definite operations and definite results. The meaning of "This stone is hard" is: "Whenever I attempt to scratch this stone with a sharp edge and a standard pressure, I fail." The meaning is in terms, not of a specific operation and a specific result – which would be merely in terms of a particular sense experience – but of a kind of operation and a kind of result. The meaning is thus given in a 'conditional' proposition. A statement is meaningful because it is possible to say what the operations and results are in terms of which it is understood. The conditional statement which gives the meaning of any proposition is "the general description of all the experimental phenomena which the assertion of the proposition virtually predicts" (5.427). Peirce intends to say that the conditional translation which gives the meaning is a *prescription* for attaining definite experimental results upon definite experimental operations. Clearly there is no limit to the prediction (or prescription) of experimental consequences involved in any synthetic sentence. "To call the stone *hard* is to predict that no matter how often you try the experiment, it will fail every time. That innumerable series of conditional predictions is involved in the meaning of this lowly adjective" (1.615). This limitless reference, involved in any sentence, to the prediction of experimental results, is what Peirce means by his declaration that "the rational meaning of every proposition lies in the future" (5.427). Every synthetic sentence involves, in its very meaning, an infinite series of experimental confirmations. The pragmatic analysis, by its translation of any synthetic sentence, shows such a sentence to be general, and therefore to be incapable of final confirmation. Far, then, from construing every sentence ultimately in terms of intuitive or atomic

[21] In 1901 Peirce says, "It can hardly be maintained that, when Poincaré says that there is no physical law whatever which will not be rendered more certain by every new confirmatory experiment, he is depriving those laws of all meaning as propositions" (6.370).

sentences, pragmatism is actually one form of the argument against intuition or incorrigible verification. It may be regarded as a bulwark of fallibilism.

If we wanted to state pragmatism concisely, we could do it some what as follows. Every statement has consequences; but only those statements are genuinely synthetic which have sensible or experimental, i.e. confirmable, consequences. Each consequence of a statement is a logical interpretant of that statement. Any single interpretant, however, or any finite class of interpretants, is only a partial translation, and cannot be said to be the 'meaning' of the statement. As the meaning of a given statement we require another statement that is general, and this statement will be a definite kind of logical interpretant, which we may conveniently call the "pragmatic interpretant." It will be, in effect, a *formula for the entire class of confirmable consequences* of a statement; it will illuminate the statement, so to speak, by revealing its logical equivalent. Pragmatism is the doctrine that the meaning of a synthetic sentence is its pragmatic interpretant; or in other words, that no synthetic sentence has meaning unless it has a pragmatic interpretant.

In the succeeding sections I propose to dwell on the scope and implications of pragmatism. It is desirable to consider pragmatism's relation to other essentially empirical views which on certain points share common ground with it. One of these is positivism, another is the pragmatism of James. In the case of positivism I shall not to the least extent enter into a discussion of the views of those men generally known as positivists, but consider only Peirce's attitude toward them and the movement they represent, regardless of whether or not he understood them perfectly; it is sufficient for us that this attitude makes clearer his own pragmatism. In the case of James, whose enunciation of pragmatism has been better known and more influential than that of Peirce, it seems profitable to consider the relation of his pragmatism to Peirce's both in the latter's eyes and in fact.

Pragmatism and Positivism. Peirce disposes of the possible suggestion that his pragmatism can be called a "thorough-going phenomenalism" (5.428). Phenomenalisin lays emphasis on the phenomenal interpretation of signs, that is, on a sensuous interpretation. Peirce admits that a "thorough-going phenomenalism" would be a "kind of pragmatism." But we have seen enough to understand why, far from being a mere method of sensuously interpreting signs, pragmatism "on the contrary, eliminates their sential element, and endeavors to define the rational purport...." (*ib.*). We must once again recall the distinction between the material quality of cognition (the sensuous) and cognition; between that which is inseparable from thought yet insufficient, and thought properly speaking, which has the character of representation between meaning as the set of images associated with a sign, and as the formula for the publicly ascertainable definition or

confirmation of a sign. What Peirce always calls the "rational purport" or "rational meaning" is expressed by the pragmatic interpretant in public, communicable, cognitive terms.[22]

Although Peirce finds a pragmatic strain in a number of preceding philosophers, he credits Comte with perhaps a predominant share (cf. 5.11, 2.7, 6.273). In Peirce's words, Comte formulated the maxim that "no hypothesis ought to be admitted, even as a hypothesis, any further than its truth or falsity is *capable* of being directly perceived" (5.198). Comte was correct in condemning hypotheses that were not 'verifiable'; but the important thing, in Peirce's opinion, is to understand the proper import of this word. The positivistic conception of verifiability is perhaps the chief point of distinction between positivism and pragmatism. Comte's works, says Peirce,

> "are warm (as they say in Hide and Seek) to living truths, although they are invariably most inaccurately analyzed and formulated. For example, nothing can be truer than that a hypothesis is good for nothing unless it is, as Comte says, 'verifiable', provided this means that the hypothesis is of such a nature that, if true, it will lead to correct anticipations as to the character of percepts and diminish the number of surprises; but Comte's definition, that a verifiable hypothesis is one whose substance is of such a nature as to be capable of being itself directly perceived, makes his maxim an arbitrary and indefensible limitation of useful knowledge. The past, for example, is of its nature incapable of being directly perceived, and therefore, according to Comte (too literally taken), we ought not to believe at all that there ever was any past, and, as he proposes to give up the word 'cause' altogether, so he ought to have given up the preterit definite and indefinite of all verbs."[23]

The important thing, after all, is the proper analysis and formulation of pragmatism, not merely its adumbration; and Peirce may be justified in taking Comte's words literally if by so doing he can reveal the inadequacy of analysis

[22] "Suppose two men, one deaf, the other blind. One hears a man declare he means to kill another, hears the report of the pistol, and hears the victim cry: the other sees the murder done. Their sensations are affected in the highest degree with their individual peculiarities. The first information that their sensations will give them, their first inferences, will be more nearly alike, but still different; the one having, for example, the idea of a man shouting, the other of a man with a threatening aspect; but their final conclusions, the thought the remotest from sense, will be identical and free from the one-sidedness of their idiosyncrasies" [Review of Fraser's ed. of Berke1ey, *N. Amer. Review*, Vol. 113 (1871), p. 455].

[23] Review of L. Lévy-Bruhl's *The Philosophy of August Comte*, in *Nation*, Vol. 78 (1904), p. 336. Cf. 2.511n.

and lack of rigor of formulation inherent in it. He attributes the feebleness of Comte's analysis (in a characteristic charge which he makes against many others) to a pleasant but unfortunate habit, that of "cherishing contempt for the close study of logic" (5.11). But Peirce finds a similar conception of verifiable hypotheses in others to whom he would not attribute such a vice – for instance, Poincaré, Mach and Karl Pearson. The positivistic conception of verifiability, on Peirce's view, springs from a failure to grasp thoroughly the distinction between the cognitive and the merely perceptual, that is, from a failure to understand the character of knowledge.[24] A proper understanding of the character of knowledge penetrates to the fallibility of all knowledge, to the impossibility of finality in verification.

The sensationalistic atomism of the positivists regards the 'real' as consisting in the 'first impressions of sense'; what Peirce regards as the genuinely cognitive it labels 'fictitious' or 'subjective'. All the complex intellectual operations are conceptual devices or instruments whose sole purpose is to subserve the reception of sense-impressions. But for Peirce these so-called 'first impressions of sense' are not such at all: there are no purely specific and isolated sense-impressions; there are only relatively complex percepts, this complexity being always discoverable on subsequent (i.e. retrospective) analysis. And moreover, even these percepts are a necessary but insufficient constituent of knowledge. Sometimes (in other language, no longer speaking of either 'impressions' or 'percepts'), the view of Peirce is set over, by positivists, against empiricism, which is said to appeal, as its cardinal tenet, to the authority of 'immediate experience'. But "as for *immediate* experience, ... it is known to us as immediate only inferentially."[25] The "method of prediction and experimentation has proved the master-key to science; and yet ... Professor Pearson tries to persuade us that prediction is no part of science, which must only describe sense-impressions."[26] On the contrary, to say that a hypothesis ought to be verifiable is to say that "it ought to be little more than a ligament of numberless possible predictions concerning future experience, so that if they fail, it fails" (5.597). On Peirce's judgment of the positivists, their analysis fails to understand that it is the predictive character of a hypothesis which makes it a *meaningful* statement in the first place.

Peirce's Realism. Against the nominalistic view of the positivists, that genuine cognition consists in the reception of sense-impressions and that the intellectual processes are merely convenient devices for the organization and ordering

[24] Cf. 5.597, and review of Pearson, *Pop. Sci. Mo.*, Vol. 58.

[25] Review of English trans. of Mach's *The Science of Mechanics*; *Nation*, Vol. 57 (1893), p. 252.

[26] Review of Pearson, *loc. cit.*, p. 305.

of these sense-impressions, Peirce opposed his realism. He says that a "strenuous insistence upon the truth of scholastic realism, or a close approximation to that..." is one important characteristic distinguishing his pragmatism from positivism (5.423). Often he calls himself a follower of Duns Scotus in this matter (e.g. 4.50).[27] Perhaps no theme is so recurrent and so vehemently reiterated as this belief in realism. Whatever Peirce finds susceptible of criticism in another thinker he is sooner or later likely to brand "nominalistic," often with remote relevancy. In spite of this voluminousness it is amazing that a clear or concise statement of his realism is not to be found in his writings. Very significant, however, are his remarks that the view which he holds is "well-stated by ... Francis Ellingwood Abbot in the Introduction to his *Scientific Theism*" (5.423); and that this book "has so clearly and with such admirable simplicity shown that modern science is realistic that it is perhaps injudicious for me to attempt to add anything on the subject" (4.1). He says also that he himself had formerly "acknowledged that the tendency of science has been toward nominalism," but that Abbot had convinced him of the superficiality of the nominalistic aspects he had pointed out, and that science had in fact been and must always be realistic (1.20; cf. 4.50). In view of the long digression that a thorough discussion of Peirce's own pronouncements on realism would involve, I am going to take his statements about Abbot literally and adopt the unorthodox procedure of considering only the latter's formulation of realism for the purpose of attributing it to him.

Abbot calls his realism 'relationism'. It "carefully shuns the great error of scholastic realism, i.e. the hypostatization of universals as substances, entities, or things; it teaches that genera and species exist objectively, but only as relations, and that things and relations constitute two great, distinct orders of objective reality, inseparable in existence, yet distinguishable in thought."[28] He points out, as did Peirce in 1877, that the scientific method presupposes the existence of an objective order; but he emphasizes clearly that the supposition of real or independently existing things entails the view that there exist real relations among these things; that the conception of distinct things as not standing in relation to one another is senseless, or that the logical consequence of such a supposition is solipsism. He holds that the objective reality of relations explains the character of knowledge; for "all knowledge consists in the seizure of the relations of things."[29] And the propositions of science are formulations of these relations.[30] Abbot's account of "objective reality" has much in common

[27] But cf. 1.560, where Scotus is said to "incline too much toward nominalism." (Cf. also *N. Amer. Rev.*, 1871. Vol. 113).

[28] *Scientific Theism* (1885), p. 28.

[29] *Ibid.*, p. 42.

[30] Cf. *ibid.* pp. 59–65.

with Peirce's: "The known objectivity of a relation is simply the known objective truth of the proposition which states it. But the relation itself was objectively real before the proposition which stated it was conceived; it determined the proposition, not the proposition it."[31] It is a great temptation to quote at length from this book of Abbot, whom Peirce called "one of the strongest thinkers I ever encountered";[32] and it is a nice question just how much Peirce was influenced by both the writings and conversation of his old friend of the Metaphysical Club.

It is precisely because of the fact that names – and positive knowledge consists of assertions or tacit assertions in which names occur – are on Peirce's view names not of atomic, independent things or properties but of properties-in-*relation*, that knowledge is fallible, for we can never attain a perfectly complete account of all of a thing's relations; and the view that names are names of properties-in-relation is nothing less than a highly condensed way of stating the pragmatic criterion of their meaning. "Generality," says Peirce in a manner reminiscent of Abbot, "is ... an indispensable ingredient of reality; for mere individual existence or actuality without any regularity whatever is a nullity" (5.431).[33] If we accept the realism just outlined as essentially the view of Peirce, we can appreciate the force of his belief that it is an important feature distinguishing pragmatism from positivism. The sensationalistic atomism which he had in mind presupposes a world of things analyzed (and known) in terms of individual sense-impressions. Mach and Pearson explain the alleged 'relations among things' – the most important of which are the so-called natural laws – as fictions created by science to organize these sense-impressions. And not merely the system of physical science but all mental processes in any degree abstract, are not a reflection of real relations but a mental device subserving an account of the succession of sense-impressions. It is therefore not the abstract or predicative or judicative element of thought that makes it genuinely cognitive but the element of immediate feeling. This view of the judicative element of thought as fictive in character Peirce attributes to the influence of the "prescientific sensationalists," those who, like Hobbes and Locke, held that generalizations and abstraction were matters of convenience. "Mach pushes this idea so far as to see no value in science except as an economy. 'The end of science', he says, is to *save* experiences by the reproduction and anticipation of facts in thought'. He does not make it quite clear why he should wish to

[31] *Ibid.* p. 63.

[32] Letter to James, 1904 (in Perry, *op. cit.*, II, p. 431).

[33] In 1871 Peirce says: "General conceptions enter into all judgments, and therefore into true opinions. Consequently a thing in the general is as real as in the concrete" (*N. Amer. Rev.*, Vol. 113. p. 457.

save experiences, unless they are disagreeable, nor how he can save experiences except by slumbering."[34]

Peirce, then, believes in the objective reality of law. Scientific formulae do not create these laws but attempt to represent them, and by so doing to predict what will be confirmed or discredited by experiment. And not only scientific formulae but knowledge in general reflects real relations and is not merely a device superimposed upon the phenomenally given. In Peirce's review of Pearson's *Grammar of Science* there is a little burlesque of positivist nominalism which, since it reveals clearly the tenor of his criticism, is worth quoting in full:

> "An ignorant sailor on a desert island lights in some way upon the idea of the parallelogram of forces, and sets to work making experiments to see whether the actions of bodies conform to that formula. He finds that they do so, as nearly as he can observe, in many trials invariably. He wonders why inanimate things should thus conform to a widely general intellectual formula. Just then, a disciple of Professor Pearson lands on the island and the sailor asks him what he thinks about it. 'It is very simple', says the disciple, 'you see you made the formula and then you projected it into the phenomena'. *Sailor*: What are the phenomenal? *Pearsonist*: The motions of the stones you experimented with. *Sailor*: But I could not tell until afterwards whether the stones had acted according to the rule or not. *Personist*: That makes no difference. You made the rule by looking at some stones, and all stones are alike. *Sailor*: But those I used were very unlike, and I want to know what made them all move exactly according to one rule. *Pearsonist*: Well, maybe your mind is not in time, and so you made all the things behave the same way at all times. Mind, I don't say it is so; but it may be. *Sailor*: Is that all you know about it? Why not say the stones are made to move as they do by something *like* my mind?
>
> When the disciple gets home, he consults Dr. Pearson. 'Why', says Dr. Pearson, 'you must not deny that the facts are really concatenated; only there is no rationality about that'. 'Dear me', says the disciple, 'then there really is a concatenation that makes all the component accelerations of all the bodies scattered through space conform to the formula that Newton, or Lami, or Varignon invented?' 'Well, the formula is the device

[34] Review of Mach, loc. cit. p. 252. Peirce is elsewhere more sympathetic yet not sufficiently liberal in interpretation. He says (5.601), "Mach has done the most to show the importance in logic of the consideration of Economy." But he holds that "Mach goes altogether too far. For he allows thought no other value than that of economizing experiences. This cannot for an instant be admitted. Sensation, to my way of thinking, has no value whatever except as a vehicle of thought."

> of one of those men, and it conforms to the facts'. 'To the facts its inventor knew, and also to those he only predicted?' 'As for prediction, it is unscientific business'. 'Still the prediction and the facts predicted agree'. 'Yes'. 'Then', says the disciple, 'it appears to me that there really is in nature something extremely like action in conformity with a highly general intellectual principle'. 'Perhaps so', I suppose Dr. Pearson would say, 'but nothing in the least like rationality'. 'Oh', says the disciple, 'I thought rationality was conformity to a widely general intellectual principle'."[35]

Let us remember that according to the pragmatic criterion of meaning any judgment of fact is an implicit prediction, a reference to the future. Now "... a prediction is essentially of a general nature, and cannot ever be completely fulfilled. To say that a prediction has a decided tendency to be fulfilled, is to say that future events are in a measure really governed by a law.... If the prediction has a tendency to be fulfilled, it must be that future events have a tendency to conform to a general rule" (1.26). In a universe devoid of law knowledge would be impossible; the very meaning of the thought-signs which constitute it is such that they involve prediction.

On Hypotheses. Peirce declares, in his "Lectures on Pragmatism" of 1903, that pragmatism "the logic of abduction." It is a rule "as to the admissibility of hypotheses to rank as hypotheses" (5.196). Now we have employed, up to this point, a definite sense of 'hypothesis', according to which the word characterized any synthetic statement whatever, a synthetic statement being a hypothesis in the sense that it is not intuitive, i.e. in the sense that it is theoretically capable of further confirmation. But we must now examine in more thorough fashion Peirce's use of 'hypothesis', because on the matter of 'scientific hypotheses' pragmatism differs from positivism. Let us consider (1) What the positivist view which Peirce sets over against his own is; (2) What Peirce's fundamental views on 'hypothesis' are; (3) What the pragmatist view which Peirce opposes to positivism is.

(1) The view which we find Peirce opposing to his own holds, on account of, or as expressive of, its underlying nominalism, that the propositions of science should properly describe sense-impressions, and hence that no proposition is admissible in science which is not at least capable of being conclusively verified by direct perception. Positivists of course differ; we ought not, if we were exact, to speak of Comte and Mach as positivists in the same sense. We have agreed not to enter into such discrimination so long as we succeed in clarifying Peirce's own view. Nevertheless it may not be irrelevant to point

[35] *Loc. cit.*, p. 305.

out that with respect to Comte in particular – in Peirce's brief references to positivism he is given comparatively the most attention – Peirce's interpretation may not be so questionable as it appears. Chauncey Wright, as early as 1865, did take it for granted, it is true, that the positivists accepted hypotheses that were 'indirectly' verifiable: "... the value of these theories can only be tested, say the positivists, by an appeal to sensible experience, by deductions from them of consequences which we can confirm by the undoubted testimony of the senses."[36] If Comte admitted "indirect" confirmation, at least the consequences of a hypothesis would have to be directly, and conclusively, confirmed. But that he did admit it is doubtful. He accepts the distinction, much older than his positivism, between 'hypotheses' and empirical laws; and it would seem that his radicalism consisted in stressing not merely verification but verification by direct observation. Empirical laws presumably *are* verified by direct perception; hypotheses, to be admissible, must be *capable* of such verification. Regardless of their actual differences, all positivists seem to agree upon Newton as the main source of the distinction between 'hypothesis' and 'empirical law'; in particular his assertion at the end of the *Principia*, "I frame no hypotheses." Newton meant by 'hypothesis' a proposition arrived at in a definite way. The laws proper to 'experimental philosophy' he believed should be framed by 'induction' from 'particular propositions' 'inferred from the phenomena'. By 'hypothesis' he accordingly meant a proposition not arrived at in this way: "Whatever is not deduced from the phenomena is to be called an hypothesis." The law of gravitation is "deduced from the phenomena," but a proposition about the "causes of those properties of gravity" which Newton declares he had been unable to deduce from phenomena would be a hypothesis.[37] Newton thus apparently meant by "hypothesis" not merely a proposition inferred in a certain way, but also (consequently) one asserting something about properties not directly observable.

(2) In Peirce there are to be found two fundamentally different views of the meaning of 'hypothesis'. When I say 'fundamentally different' I do not mean

[36] "The Philosophy of Herbert Spencer," *N. Amer. Rev.* 1865 (Rep. in Philosophical Discussions, ed. C. E. Norton, p. 47).

[37] The entire relevant passage is: "Hitherto I have not been able to discover the causes of those properties of gravity from phenomena, and I frame no hypotheses; for whatever is not deduced from the phenomena is to be called an hypothesis; and hypotheses, whether metaphysical or physical, whether of occult qualities or mechanical, have no place in experimental philosophy. In this philosophy particular propositions are inferred from the phenomena, and afterwards rendered general by induction. Thus it was that the impenetrability, the mobility, and the impulsive force of bodies, and the laws of motion and of gravitation, were discovered. And to us it is enough that gravity does really exist, and act according to the laws which we have explained, and abundantly serves to account for all the motions of the celestial bodies and of our sea." (*Principia*, penultimate paragraph).

'wholly inconsistent', for they are not. What I mean will be clear if we consider the two views as concerning not the meaning of 'hypothesis' alone but the relation between abduction and induction. An examination of Peirce's writings will reveal that the two views, which we may call (*a*) and (*b*), are respectively earlier and later, the first prevailing almost up to 1900, the second after 1900. It should be strongly emphasized at the outset that common to both views is the conception of a hypothesis as the conclusion of an inference, namely, abduction. This type of inference is always conceived by Peirce in the same way, as of a form in which the conclusion is obtained by "affirming the consequent" (cf. 5.189, p. 46 above; 6.472, 2.623, 2.706, 2.712; p. 50 above[38]). The points on which the two views differ are, first, the nature of the conclusion of an abduction, i.e. the nature of 'hypothesis'; second, the relation between abduction and induction, which involves views on the purpose and function of each.

(*a*) On this view, abduction and induction are two kinds of inference, each of which is independent of the other. By induction we discover (conclude) 'laws', by abduction we discover 'causes' (i.e. conclude 'hypotheses'). Peirce recognized that he was following Newton's usage, if not his views (2.707). In induction "we conclude that facts, similar to observed facts, are true in cases not examined"; in abduction "we conclude the existence of a fact quite different from anything observed" (2.636). Induction is thus "reasoning from particulars to the general law; [abduction] from effect to cause. The former classifies, the latter explains" (*ib.*). This conception of a hypothesis as a statement "quite different" from an observed fact from which it is adduced (and which, with other observed facts, it is able to predict) is quite broad, and, to judge from Peirce's examples, comprises three sub-classes of statements.

(i) A hypothesis may, in the first place, be a statement of a fact not observed when the abduction is made but which is nevertheless capable of subsequent direct observation. For example, if I see some white beans, and I happen to know that if these beans come from a given bag then they must be white, I may conclude that the beans I saw do come from this bag (cf. 2.623). This hypothesis, like any other, would 'explain' the whiteness of the observed beans, would state the 'cause' of the beans being white. It is itself, however, capable of direct observation. (ii) A hypothesis may be not capable of direct observation because it refers to the past (cf. 2.642); as for instance when we abduce the hypothesis that the sea once covered the land in order to explain piscivorous fossils observed, or when we abduce the hypothesis of the existence of Napoleon, in order to explain the presence of documents (2.625); and

[38] See also *Century Dictionary*, "Hypothesis," usage no. 4.

> these hypotheses may, more properly than those of the first class (as Peirce apparently failed to see), be called statements of 'causes'. (iii) Finally, a hypothesis may be a 'scientific' hypothesis, a 'theory' (excluding historical theories, which belong to the second class), in which case it would be a statement about what has never been observed, e.g. atoms, luminiferous ether, etc. (cf. 5.589).

Such statements would be most properly called statements of 'causes'. On the present view, they 'explain' empirical laws or formulae, which are the result of induction or generalization from facts directly observable. These three classes of hypotheses, then, are all statements of facts 'quite different' from the observed facts from which they are abduced.[39] They all infer "from facts of one kind to facts of another," while induction "infers from one set of facts another set of similar facts" (2.642). The conclusions of inductions, as opposed to these conclusions of abductions, are 'generalizations'. In induction "we find a certain thing to be true of a certain proportion of cases and infer that it is true of the same proportion of the whole class"; in abduction we observe some fact or circumstance "which would be explained by the supposition that it was a case of certain general rule, and therefore adopt that supposition" (2.624). The present view will be most clearly seen to differ from (*b*) if we consider the following passage, which appears in "A Theory of Probable Inference" of 1883 and is used almost verbatim by Peirce as part of his definition of 'Hypothesis' for the *Century Dictionary* in 1889:

> "The conclusions of Hypothetic Inference *cannot be arrived at inductively*, because their truth is not susceptible of direct observation in single cases. *Nor can* the conclusions of Inductions, on account of their generality, *be reached by hypothetic inference*. For instance, any historical fact, as that Napoleon Bonaparte once lived, is a hypothesis; we believe the fact, because its effects – I mean current tradition, the histories, the monuments, etc. – are observed. But no mere generalization of observed facts could ever teach us that Napoleon lived. So we inductively infer that every particle of matter gravitates toward every other. Hypothesis might lead to this result for any given pair of particles, but it never could show that the law was universal (2.7 14, my ital; Cf. *Cent. Dict.*)."

(*b*) On Peirce's later view, which we take to be definitive and have already assumed throughout Part I, abduction and induction are different types of inference, but they are not independent, and the conclusion of any induction is identical with that of some abduction, that is, it is some hypothesis. *Any*

[39] The perceptual judgment as hypothesis would be the most extreme case of the first of these classes.

synthetic proposition, in so far as it is for the first time entertained as possibly true, must be the result of an abduction. Whether the proposition be a statement about non-observable entities or a generalization (so-called) or a perceptual judgment, it is a hypothesis arrived at by abduction. Peirce calls abduction the "First Stage of Inquiry" (6.472). On this view, however, not only is every synthetic proposition a hypothesis in so far as it is first suggested to the mind as true, but every proposition remains a "hypothesis" in so far as it is synthetic. What is induction? "Induction is the experimental testing of a theory.... It sets out with a theory and it measures the degree of concordance of that theory with fact" (5.145); "Induction consists in starting from a theory, deducing from it predictions of phenomena, and observing those phenomena in order to see *how nearly* they agree with the theory" (5.170); induction "consists in testing a hypothesis *already recommended* by the retroductive procedure..." (2.755; my ital.); "Induction takes place when the reasoner already holds a theory..." (2.775). But perhaps the clearest statement is: "Induction is an Argument which sets out from a hypothesis, resulting from a previous Abduction and from virtual predictions, drawn by Deduction, of the results of possible experiments, concludes that the hypothesis is true in the measure in which those predictions are verified..." (2.96; cf. 6.472, 5.590–1). The conclusion of an induction consists in "extending a certain confidence to the hypothesis" (6.526; cf. 6.527, 2.777). The conclusion of an induction, then, is always some hypothesis previously abduced. An induction concludes a hypothesis by 'generalization' from the confirmed consequences of that hypothesis; and the more numerous, diverse and random these confirmed consequences are, the stronger the induction and consequently the sounder the confirmation of the hypothesis. And the reason why every synthetic proposition remains a hypothesis is that it is always further confirmable by induction. I want to quote further in support of the point that any statement may be concluded by an abduction.

> "All our knowledge may be said to rest upon *observed facts* (6.522; P's ital.) ... Knowledge must involve additions to the facts observed (6.523) ... *Any* proposition added to observed facts, tending to make them applicable *in any way* to other circumstances than those under which they were observed, may be called a hypothesis (6.524; my ital.) ... By a hypothesis, I mean, not merely a supposition about an observed object, as when I suppose that a man is a Catholic priest because that would explain his dress, but also *any other* supposed truth from which would result such facts as have been observed, as when van't Hoff, having remarked that the osmotic pressure of one per cent. solutions of a number of chemical substances was inversely proportional to their atomic weights, thought that perhaps the same relation would be found to exist between the same properties of any other chemical substance" (6.525; my ital.).

On view (*a*) this last example of an abduction would have been called 'generalization' which could only be the result of induction, abduction being unable to conclude anything of such generality (cf. 2.714, quoted above). On the present view any such generalization is *suggested* by abduction, and only *confirmed* by induction. Clearly, contrary to (*a*), a generalization, no less than any other proposition conjectured (abduced), goes beyond actually observed facts; On the present view abduction alone can introduce anything new in knowledge (e.g. 5.171,5.145, 2.777); induction "never can originate any idea whatever" (5.145), for it simply confirms what has already been tentatively contributed to knowledge.[40]

In opposing views (*a*) and (*b*), I do not wish to suggest that Peirce held one view until 1900 and suddenly abandoned it after that date; for the roots of the later view go further back, and it is only the case that they become explicit after 1900. In 1893 the view that induction properly occurs only after a previous abduction was virtually expressed when Peirce said, reflecting the "views of Whewell," that "progress in science depends upon the observation of the right facts by minds *furnished with appropriate ideas*" (6.604).

(3) We are flow better able to understand the difference between the views of Peirce and the positivists who, meaning primarily by 'hypothesis' something opposed to an empirical formula, make it secondary or instrumental to the latter, and even then impose a radical condition on its admissibility. Peirce's opposition of hypotheses and empirical formulae on his earlier view was not this kind of opposition. It was concerned primarily with different types of inference; and whereas for the positivists "hypotheses" were statements about assumed entities (subdivided into admissibly and fictitiously assumed entities), for Peirce a statement about assumed entities was only one kind of hypothesis. A fortiori, his later view is even further from that of the positivists, understanding by a 'hypothesis' any synthetic statement whatsoever. He specifically rejects the way in which 'hypothesis' is 'ordinarily used' (under positivist influence), as that "which carries with it a suggestion of uncertainty, and of something to be superseded"; this sense "does not belong at all to my use of it" (2.707). Hypotheses are indeed "provisional" or "probational" (e.g. 1.68, 2.96), but in the sense that they are not perfectly certain, not in the positivist sense of something resorted to for lack of anything better, and instrumental in any event to what is purely descriptive (see 5.276n. usage 8; *Cent. Dict.* usage 5; 2.642).

The reason why Peirce can safely ignore various distinctions among the kinds of hypotheses and remain free from error or superficiality is that the

[40] Peirce sometimes takes the view that confirmation also is an "ampliation of our positive knowledge" (2.96). This of course is not incompatible with the sense in which abduction alone increases knowledge. Ordinarily, both abduction and induction are called "ampliative" inferences; and this term may be retained in the sense that both are distinguished from explicative or analytic inference (cf. 2.623).

ultimate test of any statement's admissibility is for him the pragmatic criterion. The class of hypotheses is identical with that of synthetic statements, and a hypothesis is admissible if it is meaningful. His full support of hypotheses which posit unobserved properties or entities[41] is based on his examination of the actual procedure of science and his long experience as professional physicist. In his review of the first volume of James's *Principles of Psychology* he takes issue with the dictum in James's Preface that "all attempts to *explain* [the] phenomenally given ... as products of deeper-lying entities ... are metaphysical." James had also said that "in this strictly positivistic point of view consists the only feature for which I feel tempted to claim originality." Pointing out that the application of the epithet 'metaphysical' is too easy a way of eliminating from science a procedure for which one happens to have a distaste, and that the above dictum cannot by itself suffice for such an elimination, Peirce says: "Nor is it in the least true that physicists confine themselves to such a 'strictly positivistic point of view'. Students of heat are not deterred by the impossibility of directly observing molecules from considering and accepting the kinetical theory; students of light do not brand speculations on the luminiferous ether as metaphysical.... All these are 'attempts to explain phenomenally given elements as products of deeper-lying entities'. In fact, this phrase describes, as well as loose language can, the general character of scientific hypotheses."[42] The important consideration is that hypotheses of this kind do have observable consequences and may be confirmed by the confirmation of a great many of these. *Any* statement is meaningful if it is capable of confirmation, and any statement is acceptable as established in science if it is actually confirmed. In a review of a translation of Spinoza's *Ethics*, Peirce calls attention to the fact that the procedure of Galileo, who appealed to both common sense and *il lume natural* (cf. 1.80, 6.10) and of Spinoza, are of precisely the same kind. "But what he and all his school fail to remark is that the conclusions of the students of mechanics are sure to be brought to the test of experiment in various ways. It is just that quiet verification that makes all the difference in the world. A hypothesis of any kind has no positive support until it has predicted something capable of being observed and that prediction verified" (my ital.).[43] Probably the protest that Peirce would on other occasions have made against the exclusion of

[41] Peirce makes no distinction between unobserved and unobservable, or between a hypothesis in science "adopted as a probable representation of a state of things which may really exist though imperceptible to the senses" and one adopted "merely as a convenient means of expressing the laws of phenomena" (Rankine, *Miscellaneous Scientific Papers*, p. 210).

[42] *Nation*, Vol. 53 (1891), p. 15.

[43] *Nation*, Vol. 59 (1894), p. 345.

hypotheses positing assumed entities is that it blocks the way of inquiry. To make strictures on such hypotheses is to discourage conjectural explanations whose immediate justification is not evident. Not only does it contradict the historical achievements of classical science, but it violates the freedom which lies at the basis of scientific method. All hypotheses are essentially the same in that all are adopted to explain, or in general 'add to' (6.523–4), what is observed; and even the hypotheses concerning assumed entities are in principle no different from hypotheses about the past (cf. 5.597, 2.511n.; p. 163 above). Especially can this be seen in historical philology, in, for example, the translation of the cuneiform inscriptions (5.589), where conjectures were multiplied one on another, until mutual confirmation of the readings, together with confirmation from accepted history and the facts of linguistics, established the theory.

Perhaps the statement we originally considered, that pragmatism is the 'logic of abduction', will now be clearer. For after all, abduction must on the whole "cover all the operations by which theories and conceptions are engendered" (5.590).

The Element of Conventionalism in Peirce. Peirce's satire of Mach's view that science is a device of "saving experiences by the reproduction and anticipation of facts in thought" is unduly attentive to the letter and hardly to the spirit, which differs not very greatly from that of Peirce himself. For he regards the purpose of a scientific hypothesis as being "to lead to the avoidance of all surprise and to the establishment of a habit of positive expectation that shall not be disappointed" (5.197). But granted the differences we have mentioned, we may ask whether it follows from Peirce's realistic interpretation of hypotheses that he excludes altogether the element of convention stressed by the positivists. Although his writings on this subject are scanty, it is possible to distinguish three forms in which conventionalism enters his views; first, with respect to the choice of hypotheses in science; second, with respect to the language of science; third, with respect to the results of science, i.e. with respect to the concepts of truth and reality. These divisions are closely related, and might in fact be regarded as the same set of opinions looked at from three different points of view. But if so, then at least it will be plain that the conventionalism regarded from the third point of view is much more prominent than that regarded from the first.

(1) According to Peirce there is an 'arbitrary element' in scientific theories; but as these theories progress, they "become more and more purified from the dross of subjectivity" (5.589). Just what this statement implies is not clear, for he does not expatiate. Very likely he has no more in mind than that the arbitrary element arises from the possibility of employing different hypotheses to explain the same set of facts, or fundamentally different interpretations – e.g. mechanical or non-mechanical – for a given branch of science, or more

pervasive formulae in place of narrower ones. Peirce undoubtedly realized that, especially in the case of hypotheses concerning assumed entities, the replacement of one by another is not to be regarded simply as an advance toward 'objective truth' (5.589) but also as a change in formulation or expression for some reason of expedience. He would, however, hold that such a change ultimately constitutes a link in the progress toward 'objective truth' (as he defines it – cf. (3) below); that one of the two differently formulated hypotheses could ultimately be shown to be the 'truer'. Now the only point, discussed in a number of places by Peirce, that possibly bears on the matter of conventional choice among hypotheses, is the question of 'simplicity'. Peirce accepts Ockham's razor, which be states: "Before you try a complicated hypothesis, you should make quite sure that no simplification of it will explain the facts equally well" (5.60); or as follows: "Try the theory of fewest elements first; and only complicate it as such complication proves indispensable for the ascertainment of truth" (4.35).[44] Peirce regards this principle as basic to scientific procedure and not nominalistic (4.1). His acceptance of it raises two questions: (*a*) What does he mean by one hypothesis being "simpler" than another? (*b*) In what sense is the simple hypothesis preferable to the complicated one, i.e. what are the implications of the principle?

(*a*) One of the statements of the principle implies that the 'simpler' hypothesis is the one containing the 'fewest elements', or better, fewest concepts. But what kind of concepts? We must make some distinction here. For Peirce says that by the 'simpler' hypothesis he does not mean the 'logically simpler', which he defines as the "one that adds the least to what is observed," but rather "the one that instinct suggests" (6.477). By saying then that the simpler hypothesis is the one containing the 'fewest elements' he does not mean the one asserting something about the fewest unobservable entities. A simple hypothesis is rather one "composed of a few conceptions natural to our minds" (6.10). So that in the first place, simple hypotheses contain numerically fewer concepts; and secondly, of two hypotheses with the same number of concepts, the simpler is not that with the least number of unobserved or unobservable 'elements' but that with the greatest number of 'instinctive' or 'natural' or 'familiar' (2.740) elements. The criterion of fewer unobservable entities is the positivist and nominalist criterion, going back to Ockham himself. Peirce's own sense of 'simple' he takes to be that of Galileo.

> "That truly inspired prophet had said that, of two hypotheses, the *simpler* is to be preferred; but I was formerly one of those who, in our dull self-conceit fancying ourselves more sly than he, twisted the maxim to mean

[44] Other statements: "A hypothesis should be stripped of every feature which is in no wise called for to furnish an explanation of observed facts" (5.26); "A hypothesis ought not to introduce complications not requisite to explain the facts" (4.1). (Cf. 6.24, 6.535).

> the *logically* simpler, the one that adds the least to what has been observed, in spite of three obvious objections: first, that so there was no support for any hypothesis; secondly, that by the same token we ought to content ourselves with simply formulating the special observations actually made; and thirdly, that every advance of science ... discloses a world of unexpected complications. It was not until long experience forced me to realize that subsequent discoveries were every time showing I had been wrong, while those who understood the maxim as Galileo had done, early unlocked the secret, that the scales fell from my eyes and my mind awoke to the broad and flaming daylight that it is the simpler Hypothesis in the sense of the more facile and natural, the one that instinct suggests, that must be preferred; for the reason that, unless man has a natural bent in accordance with nature's, he has no chance of understanding nature at all" (6.477).

(*b*) Peirce's acceptance of the principle that the simpler hypothesis is the preferable one does not imply his acceptance of the view that a simple hypothesis is in every case the best. He holds that in general there is no guarantee of the simpler being the 'truer' hypothesis and that the evidence is often to the contrary. Nevertheless he believes that the more familiar hypothesis should be 'tried first' (cf. 4.1, 5.598, 6.532). The reason appears to be twofold: First, hypotheses that are simpler in this sense are more readily eliminable, and the necessity of quick elimination is vital in scientific economy, since science is confronted with a tremendous number of possible choices.[45] Secondly, it is Peirce's view that science could not hitherto have been so successful unless there were a kind of affinity between man as a biological animal and the world he attempts to explain (cf. 5.604). For the overwhelming number of possible hypotheses could not have been manipulated if appropriate conjectures could not have been made on the basis of instinctive knowledge.[46] While it may not, on Peirce's view, be the case that the simpler

[45] Cf. also: "Good scientific economy will usually prescribe that simple hypotheses shall be thoroughly tested before resorting to complicated ones. This is the truth in Ockham's razor. But it is very far from being true, in any question concerning any science of life – psychology, physiology, and the like – that the true hypothesis is likely to be simple. On the contrary, the history of discovery in these departments shows many more examples of the old theory being found to be too simple than of its being found to be too complex" (*Nation*, Vol. 73, 1901, p. 267).

[46] "Our minds having been formed under the influence of phenomena governed by the laws of mechanics, certain conceptions entering into those laws become implanted in our minds, so that we readily guess at what the laws are. Without such a natural prompting, having to search blindfold for a law which would suit the phenomena, our chance of finding it would be as one to infinity" (6.10).

or instinctive hypothesis is the correct one, it is the best to start out with for the reason that if our ultimate result is a complicated hypothesis, it is probably a complication of the simple one originally tried. So that "instinctive beliefs," even if they do not furnish the central idea, at least furnish the main direction.[47]

Peirce's belief that Ockham's razor, in the foregoing sense, is not nominalistic, thus appears to indicate that he regarded the difference between simple and complicated hypotheses not in terms of the more and the less convenient but in terms of greater and lesser approximation to 'objective truth'. He apparently did not consider very seriously the view that in any given case a 'complicated' hypothesis may be regarded as no less true than a 'simple' one, or vice versa. The ultimate consideration for him was in terms of truth: Try the 'simple' hypothesis first, both as good economy and as an approximation toward the truth, but ultimately choose the 'truer' one in any event (Cf. 4.1, 4.35, 5.26).

(2) Peirce recognized, as a result of the pragmatic criterion, that certain problems of traditional philosophy were verbal problems, soluble by more precise formulation. If the opposing answers to a problem do not differ in the observational properties consequent upon the truth of each, they are either both meaningless or both assert the same thing. However, not only in traditional metaphysics but in physics do pseudo-problems arise. For instance, it is a pseudo-problem to ask whether force *is* an acceleration or whether it *causes* acceleration (5.404). The adoption of one or the other 'view' is a convention of language, not a matter to be decided empirically. For the application of the pragmatic criterion shows the meaning of the two expressions to be identical. Similarly in the case of such questions as whether a diamond could be said to be 'hard' if it were not pressed, or whether a stone could be called 'brilliant' if it lay in darkness at the bottom of the sea. These "concern much more the arrangement of our language than the meaning of our ideas" (5.409). Peirce means that the proper question is not whether the diamond *is* hard when we are unable to press it (for this, by its very formulation, and by the pragmatic definition of the predicate, precludes our giving an answer, and is therefore, strictly speaking, meaningless), but whether we wish to *call* the diamond hard under such conditions. We may or may not do so, with impunity.[48]

[47] Cf. 1.634: "We are driven oftentimes in science to try the suggestions of instinct; but we only *try* them, we compare them with experience, we hold ourselves ready to throw them overboard at a moment's notice from experience." (Cf. also 1.404).

[48] Peirce later (5.453, 457) calls attention to the fact that he expressed himself badly in the diamond illustration of 1878. He had implied by his words that the diamond could be called, indifferently, hard or not hard, when not *actually* pressed. This he points out, was

(3) Concerning the results of science, the 'established truths', Peirce's conventionalism is much more outstanding. What is to be regarded as an established truth in science depends upon the degree of confirmation determined by the scientific community. Since no scientific result is ever conclusive, the concept of confirmation is a relative one, and is determined conventionally – yet not arbitrarily. For Peirce a statement is true if it is accepted by the community which practices the scientific method for the purpose of attaining its belief; and the real is that which is represented in true statements. If a true statement is one confirmed to a certain degree, and if what constitutes confirmation is determined ultimately by agreement then, strictly, "truth" is determined ultimately by agreement. This is not in the least strange or awkward. For this agreement is not arbitrary agreement. It is determined by profound considerations, truth being belief *compelled* by scientific inquiry.

The notion of truth depends both upon the actual practice of science and on a goal which it seeks to attain. The notion of a perfectly true opinion has no meaning apart from the notion of opinions which correct themselves; and conversely we cannot speak of opinions as approximately true unless we conceive of some limit to which they approximate. In spite of this interdependence, it is well to point out that it is the approximately true which represents what is ordinarily understood by "true," and justifiably so. The 'true' is the 'confirmed'. The perfectly true would be that which theoretically required no alteration, or that which, no matter how far investigation were carried, would be uninfluenced in its status. It is no more than a limit or standard for increase of perfection; if it alone is regarded as synonymous with 'true', and existing opinion branded as therefore representative only of 'appearance' and not 'reality', inquiry is stifled in favor of an anti-pragmatic metaphysics. Peirce teaches that truth in general is relative to investigation; that the purpose of investigation is to destroy doubt and establish belief; and that science, being the best method of achieving this purpose, is the instrument of truth.

The sense in which truth is conventional is analogous to the sense in which 'reality' is conventional. "Reality is only the object of the final opinion to which sufficient investigation would lead" (2.693). Peirce speaks of his "social theory of reality" (6.610), according to which reality "involves the notion of a community" (5.311). "The real is the idea in which the community ultimately settles down" (6.610) ; "reality consists in the agreement that the whole community would eventually come to" (5.331). Corresponding to the two aspects of truth, is the distinction between the real as the object known

contrary to his basic realism, which must hold that the diamond is *really* hard even when not actually pressed. What he had meant was that the diamond might indifferently be called hard or not hard if it *could* not be pressed. For "we must dismiss the idea that the occult state of things ... which constitutes the reality of a diamond's hardness can possibly consist in anything but in the truth of a general conditional proposition" (5.457).

in the final opinion and the real as that known in statements ordinarily called 'true'. And although the former appears to be emphasized in the statements just quoted, the latter is in fact what is emphasized by the spirit of Peirce's thought. We do know 'reality' (cf. 5.384) though of course not with perfect precision and completeness. Reality in the perfect sense is "something which is constituted by an event indefinitely future" (5.331).

Now it is a statement recurrent time and again in Peirce that "that is *real* which has such and such characters, whether anybody thinks it to have those characters or not" (5.430); and in fact, "we may define the real as that whose characters are independent of what anybody may think them to be" (5.405). How does this – which Peirce calls the "abstract definition"[49] of reality – square with the other statements we emphasized, according to which the real is that which is represented in an opinion? Are these two views contradictory? Clearly not, once we elucidate the sense of the latter definition, which is in fact the pragmatic definition. It does not imply that reality is created by thought, that it comes into being because we happen to have opinions. It states that what reality is (i.e. what its character is), is given in a true opinion. But it goes further. It implies that if by reality as something in dependent of thought is meant something which cannot be known by thought, then the word is meaningless. For let us apply the pragmatic criterion. We then find that 'real 'can mean nothing unless definable in terms of sensible operations; and no statement which is said to be about reality or some phase of it is a meaningful statement unless it is capable of confirmation. Reality, then, is that which can only be represented in confirmable statements. It would be senseless to say that a statement which could not possibly be verified 'describes' reality. But the opinions which we adopt as our truths or true beliefs are simply those which have been to a reasonable degree confirmed; and this is why the real can only be that which is represented in such opinions, though doubtless "reality" in the perfect and complete sense would be that which is represented by the perfectly true opinion. If reality were held to be other than what is described by true opinions, that would be the same as saying that it was unknowable; and we cannot, by the pragmatic criterion, speak meaningfully of what is unknowable (cf. 5.310). Thus to speak of the 'nature of reality' is to speak of that about which we ultimately agree, of that described in our true opinions; and of anything else we cannot significantly speak. This is what is meant by a statement like the following: "The reality of that which is real does depend on the real fact that investigation is destined to lead, at last, if continued long enough, to a belief in it" (5.408).

Truth, we said, is for Peirce the opinion on which the community agrees, not arbitrarily but as "the irresistible effect of inquiry" (5.494); it is the

[49] I.e. its 'verbal' or nominal definition (cf. 5.525).

opinion which is "ultimately agreed to by all who investigate." But we must guard against misunderstanding. Peirce does not mean that on any given question the community will *in fact* always arrive at the truth (i.e. be compelled to agreement by inquiry) (6.610, 5.565). Certain questions have been settled, at least for the time being, and science therefore possesses a body of 'established truths'; but there is no guarantee that a given question will actually be settled. Peirce's point is that it is unwarranted "to suppose that, with regard to any given question (which has any clear meaning), investigation would not bring forth a solution of it, if it were carried far enough" (5.409). In other words, if a question is a meaningful question it is an answerable question, it is decidable: the truth or falsity of the answers to it must be capable of positive investigation. But to say that a question is answerable and that it will in fact be answered are clearly different. (With respect to certain questions there is *no* truth at all; i.e. the question may be meaningless). Any assertion that a given question's truth will in fact be eventually decided, can be no more than a 'hope', based, perhaps with good reason, on the history of science (cf. 6.610, 5.407, 5.565, 2.654).

CHARLES S. PEIRCE, PIONEER OF MODERN EMPIRICISM

Ernest Nagel. "Charles S. Peirce, Pioneer of Modern Empiricism." *Philosophy of Science* 7.1 (January 1940): 69–80.

No account of the development of contemporary empiricism is adequate which neglects the writings and the influence of Charles Peirce.[1] Although he is not easily pigeon-holed and can not be claimed as the exclusive property of any school or movement, it is appropriate that the hundredth anniversary of his birth should be commemorated at this Congress. For the movement of which it is a manifestation is engaged in a cooperative, intensive cultivation of the methods of the sciences with the help of the most advanced tools of modern logic; and Peirce's intellectual career was also a single-minded devotion to that task. It is fitting, also, that his birth-year be celebrated at Harvard by an international congress. For although he was denied the privilege of teaching at this university, much of his influence was propagated by William James and Josiah Royce, two of its great teachers; and however much he may have suffered from neglect during his life-time, his work surely merits recognition from a movement not confined by national bounds. It is characteristic of the best established sciences that though individuals may pursue researches in them independently of one another, the conclusions reached tend to support each other and to converge toward a common stream of sound beliefs; and such convergence is indeed the sole identifiable warrant for the confidence that some measure of the truth has been attained. It is therefore a happy sign that so many of the central ideas of the present movement have been independently developed on both sides of the Atlantic. One is not minimizing the contributions of the Vienna Circle in pointing out that many of its recent views have been taken for granted for some time by American colleagues, largely because the latter have come to intellectual maturity under the influence of Peirce.

It may nonetheless impress some as a paradox to count Peirce among the formative influences upon participants of this Congress. If, as Professor Frank recently stated, Mach is one of the spiritual ancestors of the unity of

[1] Read at the Fifth International Congress for the Unity of Science, Harvard University, September 3–9, 1939.

science movement and "the real master of the Vienna Circle," the Peirce who tried to construct a metaphysical system in the grand manner, and to provide a framework adequate for the results of the special sciences for a long time to come, seems definitely out of place in this company. He carried on a life-long polemic against positivisms of the type of Comte and Pearson; and though he had a high regard for some of the work of Mach, he expressed in no uncertain terms his condemnation of what he regarded as Mach's sensationalistic, nominalistic empiricism.[2] He confessed that he owed much to Schelling, and his architectonic cosmogony is admittedly a species of absolute idealism. He was a diligent student of the history of philosophy, he was brought up on Kant and claimed that at one time he knew the first *Critique* by heart, and he had a profound admiration for the scholastics.

But although Peirce had an abiding passion for system-building, his most vigorous efforts did not go into speculative metaphysics; and in any case the influence of metaphysical writings has been practically nil – whether because only inadequate outlines of his grandiose system appeared during his life-time, or because other tendencies which Peirce initiated swamped the effects they may have had otherwise. Indeed, seldom have severer judgments upon the claims and methods of traditional metaphysics been made than those to be found in his writings. He regarded the intrusion of metaphysical speculation into science as a hindrance to free inquiry, and distrusted an enterprise which has failed to develop methods of cooperative research among its members. His sharp criticism of Mach, though in my opinion unjust and not free from misunderstanding, were directed against what he took to be an attempt to legislate on metaphysical grounds the objects of knowledge, the limits of science, and the possible forms of physical theory.[3] But however this may be, it would be a gross misrepresentation of Peirce's views to regard them as

[2] Cf. Peirce's review of Mach's *The Science of Mechanics*, in *The Nation*, Vol. 57, 1893.

[3] Thus he declared in the above review: "Sir Isaac Newton formulated the three laws of motion which stand to-day in all the text books. The first, due to Galileo, is that a body left to itself continues for ever to describe equal spaces in equal times on one straight line. The third, Newton's own achievement in great measure, the law of action and reaction, is that one body cannot be drawn back without other bodies on the same line being drawn forward to balance it. Now Newton, with his incomparable clearness of apprehension, saw that the third law implies that spatial displacement is not merely relative, and further that, this being granted, the first law implies that temporal duration is not merely relative. Hence Newton drew the conclusion that there were such realities as Time and Space, and that they were something more than words expressive of relations between bodies and events. This was a scientific conclusion, based upon sound probable reasoning from established facts. It was fortified by Foucoult's pendulum experiment, which showed that the earth has an absolute motion of rotation equal to its motion relative to the fixed stars. Moreover, Gauss and others were led to ask whether it be precisely true that the three angles of a triangle sum up to two right angles, and to say that observation alone can

minor variants of traditional philosophic doctrines. Peirce is the nearest thing to Leibniz this country has produced, and like the latter was able to combine a speculative bent of a high order of talent and ingenuity with a power of sober analysis and sense for concrete fact. His importance in the history of recent thought is due to his contributions to logic and mathematics, and to the stimulating effect of his first-hand knowledge of the theoretical and experimental sciences upon the study of scientific methods.

> "From the moment when I could think at all," he wrote in 1897, "until now, about forty years, I have been diligently and incessantly occupied with the study of methods of inquiry, both those which have been and are pursued and those which ought to be pursued. For ten years before this study began, I had been in training in the chemical laboratory. I was thoroughly grounded not only in all that was then known of physics and chemistry, but also in the way in which those who were successfully advancing knowledge proceeded. I have paid the most attention to the methods of the most exact sciences, have intimately communed with some of the greatest minds of our times in physical science, and have myself made positive contributions—none of them of any very great importance, perhaps—in mathematics, gravitation, optics, chemistry, astronomy, etc. I am saturated, through and through, with the spirit of the physical sciences."[4]

It is unnecessary on this occasion to speak of Peirce's contributions to formal logic (e.g., his improvements upon Boole's work, his development of the logical relations, etc.), for these have been recognized long ago; and it is a safe conjecture that his technical papers on these subjects are now primarily of historical interest. It is worth pointing out, nevertheless, that for Peirce formal logic was simply one division of the general theory of signs. An adequate logical theory, according to him, must take into account the complicated properties and functions of signs in inquiry, and even the rules of formal logic were regarded by him as intimately related to the habits of action generated in the course of successful inquiry. Thus, the alleged facts of "consciousness" were dismissed by him as totally irrelevant to the question of the validity of

decide this question.... But Mach will not let it go so. His metaphysics tells him that there is no such thing as absolute space and time, and consequently no such thing as absolute motion. The laws of motion must be revised in such a way that they shall *not* predict that result of Foucoult's experiment which they did successfully predict, and that non-Euclidean geometry must be put aside on metaphysical grounds. Is not this making fact bend to theory?" *Op. cit.* p. 252.

[4] Charles S. Peirce, Collected Papers, 1.3. All references, unless otherwise specified, are to volume and paragraph of this edition of Peirce's writings.

the laws of logic; for even if consciousness were annulled it would still remain true, he said, "that such and such a habit of determining one virtual store of knowledge by another will result in the concentration of action so as to bring about definite ends" – to which he added that rationality consists in the fact that the rational being will act so as to attain certain ends.[5] Accordingly, Peirce was one of the most pronounced foes of attempts to base logic upon inner feelings of certitude or other facts of individual psychology, and his conception of the nature and function of formal logic is incompatible with interpretations of inquiry in terms of a "mentalistic" theory of thinking.

Peirce's distinctive contributions to logic as the general theory of signs center around his pragmatism, his critical commonsensism, and his fallibilism. By far the best known is his pragmatic maxim, proposed as a method for clarifying ideas, eliminating specious problems, and unmasking mystification and obscurantism hiding under the cloak of apparent profundity.[6] In one form or another his proposal was adopted by a number of distinguished thinkers, for example, in this country by William James and John Dewey, so that to-day it is almost a common place. Peirce's own formulation of the pragmatic maxim leaves much to be desired in the way of explicitness and clarity; and more recent formulations, such as those by Professor Carnap and others, have the same general intent but superior precision. I nevertheless venture two general remarks on the Peircean version of pragmatism which, though obvious, merit attention.

The pragmatic maxim was intended as a guiding principle of analysis. It was offered to philosophers in order to bring to an end disputes which no observation of facts could settle because they involved terms with no definite meaning. It was directed at the Cartesian doctrine of clear and distinct ideas, which found the terminus of analysis in vague abstractions claimed to be grasped intuitively, as well as at the common tendency to convert types of behaviors into unknowable agencies controlling the flux of events. Above all, it pointed to the fact that the "meanings" of terms and statements relevant in inquiry consist in their being *used* in determinate and *overt* ways. Pragmatism, to employ Peircean language, was thus a proposal to understand general terms in terms of their concrete application, rather than vice-versa. "We should hardly find to-day a man of Kirchhoff's rank in science," he wrote in 1903, "saying that we know exactly what energy *does* but what energy *is* we do not know in the least. For the answer would be that energy

[5] 2.66.

[6] His earliest version of it runs as follows: "Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object." 5.402.

being a term in a dynamical equation, if we know how to apply that equation, we know thereby what energy is...."[7] Now my first point is that the pragmatic maxim should be construed as an invitation to analyze specific concepts in a definite way. This "definite way" places emphasis upon the contexts in which terms occur and upon the complex of relevant practices involved in their use. Pragmatism does not supply a formula which states once for all what *the* meaning of a statement is; for when its maxim is taken seriously, it excludes the assumption that the meaning of a sentence can be determined in isolation from the system of sentences in which it occurs, the rules governing its acceptance, and the kind of behavior associated with it. It is unfortunate that so much energy has gone into controversy about the wholesale meaning of "meaning," as if any formula could state with adequacy the multifarious ways in which that word is used, instead of being turned into analyses of the specific uses of terms in different contexts. Would it not be well to shelve the term "meaning" in philosophic discussion and talk instead of the way in which terms are *used*? Pragmatism does not constitute another ambitious "prolegomena for every future inquiry," and it would be a pity if, mistaken for such rather than taken as a fruitful leading principle of inquiry, it would meet the fate of the Cartesian, Lockian, and Kantian systems. Peirce himself instituted the sort of analysis of several specific concepts called for by his maxim, and Mach's work is still valuable primarily, it seems to me, because of the splendid examples of such analysis it carried through.

I have already skirted my second point. Peirce's version of pragmatism locates the intellectual purport of conceptions not in individual sensations or perceptions, but in the concrete habits or tendencies to action to which their acceptance leads. "The whole function of thought," he maintained, "is to produce habits of action; and that whatever there is connected with a thought, but irrelevant to its purpose, is an accretion to it but no part of it. If there be a unity among our sensations which has no reference to how we shall act on a given occasion, as when we listen to a piece of music, why we do not call that thinking. To develop its meaning, we have, therefore, simply to determine what habits it produces, for what a thing means is simply the habits it

[7] 5.207. Twenty-five years earlier Peirce wrote: "In how many profound treatises is not force spoken of as a 'mysterious entity', which seems to be only a way of confessing that the author despairs of ever getting a clear notion of what the word means! In a recent admired work on *Analytic Mechanics* it is stated that we understand precisely the effect of force, but what force itself is we do not understand! This is simply a self-contradiction. The idea which the word force excites in our minds has no other function than to affect our actions, and these actions can have no reference to force otherwise than through its effects. Consequently, if we know what the effects of force are, we are acquainted with every fact which is implied in saying that a force exists, and there is nothing more to know". 5.404.

involves. Now, the identity of a habit depends on how it might lead us to act, not merely under such circumstances as are likely to arise, but under such as might possibly occur, no matter how improbable they may be. What the habit is depends on when and how it causes us to act."[8]

It is clear that this pronouncement is at least verbally different from the current version of the verifiability principle, according to which empirical propositions must be reducible to observation *statements* containing various sorts of observation *predicates*. Without intending to minimize the remarkable clarification which such a formulation has introduced or to question its superiority in point of precision over that given by Peirce, it seems to me nevertheless that an adequate empiricism can not afford to neglect Peirce's emphasis upon *habits of action* or to concentrate entirely upon the reduction of one set of statements to others. For in the first place, this emphasis makes evident the continuity of knowledge-getting with other organic activities. It involves the conception of inquiry as occurring in a definite context, instituted to settle specific doubts and problems, and terminating in an equally definite way with the establishment of smoothly working habits of action which have mastered the difficulties for which the inquiry was initiated. Knowledge thus becomes identifiable as the product of overt behavior involving cooperative effort in a community of inquirers, rather than as the outcome of a purely subcutaneous mental activity. So conceived, knowledge is in fact frequently obtained, for the claim to possess it does not involve the preposterous requirement that the outcome of one inquiry be incorrigible by further inquiry, or that unless it carries the traits of absolute finality and all-inclusiveness the product of research is not knowledge. Peirce thus laid the foundation for a theory of inquiry which eschewed a mentalistic, introspective psychology, and he espoused a molar behaviorism at a time when it was regarded as fanciful speculation.

In the second place, Peirce's emphasis is fatal to the conception that science must be grounded upon an indubitable apprehension of simple elements, whether these be atomic-facts, sense-data, or essences, all pre-manufactured and neatly packaged; for it entails the view that alleged "simples" must be contextually interpreted and that they are products of inquiry which has learned to isolate certain features of the environment as reliable clues to what is going on. It points to the fact that the adequate use of even the simplest observational terms of whatever type involves habits of manipulating objects in the environment, and that the established sense of even the most abstract terms of science involves reference at some point to gross, overt activities. Surely, no one would take seriously the professed acceptance of the physicalistic thesis of the reducibility of all terms to those occurring in every-day observation, if that acceptance did not go hand in hand with appropriate types

[8] 5.400.

of gross behavior associated with such observation terms. And the contemporary insistence upon methodological principles as resolutions and rules of language, fails in its objective to exhibit the logical articulation of science if it neglects the practical compulsions involved in the construction and manipulation of technological and laboratory apparatus.

At the risk of treading upon ground on which angels fear to step, I should also like to mention the elementary point that in terms of Peirce's emphasis neither terms nor statements can be regarded as *designating*, independently of the habits involved in their use. Consequently, "the meaning" of expressions is not to be sought in self-subsisting "facts," "essences," or other "designate," but must be construed in terms of the procedures associated with them in specific contexts. Some have suspected, perhaps unjustly, that the recently inaugurated discipline of semantics will open wide the door for the rehabilitation of Bolzano's *Saetze-an-Sich*, Meinong's *objectives*, Russell's *subsistents*, and allied conceptions of the referends of signs. Though such doctrines have had fruitful historical roles, I think it would be a retrograde step if modern logical empiricism were to revive them in a new form; for the great strength and promise of the movement has been its interpretation of the abstract in terms of the concrete, and its resolute turning from speculations which have no ascertainable consequences in issues of observable fact. I can think of no better way to still these suspicions than by placing the study of semantics into a behavioral context, and by instituting an analysis of such key semantic terms as "designation" and "truth" as used in *specific* contexts, in order to reveal the modes of action they signify.

Peirce's critical common-sensism is integral to the pragmatic attitude as developed in the present paper. Though indebted to the Scotch common-sense realists for some of his ideas and language, Peirce had nothing in common with their dogmatic faith in self-evident truths or their attempt to establish a bedrock foundation for current theologies and social theories. His critical common-sensism was an elaboration of his fundamental insight that in any inquiry we must plunge into *medias res* with all the beliefs and prejudices we actually have, and that we can not, even in principle, engage in a universal Cartesian skepticism. Every inquiry uses and takes for granted many habitual modes of action as well as specific assumptions about the course of events, which in *that* inquiry function as indubitables; and many of these assumptions, largely because they are vague, have withstood the test of repeated experience, so that it would be idle to doubt them. The adequacy of specific beliefs and habits is constantly put into question; but there can be no intelligible skepticism concerning our crude experience as a whole, since the formulation of every specific doubt requires distinctions themselves significant only in terms of the procedures of the common-day world. It is not possible, therefore, to dispense with the vague indubitables of every-day experience. Habitual behavior can not be "justified" by any theory of logic or of the universe and it can not be

"clarified" by trying to exhibit it as a complex of psychological or ontological simples, since every attempt to do so must be brought to the test in the work-a-day world of gross, vague distinctions. The justification and clarification can be brought about only by showing what the consequences of such behavior are and that it is adequate to the situation at hand – it being noted that the consideration of consequences and adequacy leads finally to the same sort of gross behavior which furnished the occasion for doubt.

Peirce claimed no infallibility for the beliefs of every-day experience, and indeed one of the cardinal tenets of his thought was a universal fallibilism. Peirce's fallibilism is a consequence of his regarding the method of science as the most successful yet devised for achieving stable beliefs and reliable conclusions; it has nothing to do with the malicious scepticism which rejects science on the ground that its conclusions are after all not established as being beyond the possibility of error, only to invoke a special set of imperatives as indubitable objects of human endeavor. Peirce noted that the conclusion of no scientific inquiry is exempt from revision and correction, that scientists feel surer of their general logic of procedure than of any particular conclusions reached by it, and that the method of science is self-corrective, both as to its own specific features and the specific conclusions gained with it. These insights dove-tail neatly with what has already been said concerning the importance of construing concepts and statements in terms of the procedures associated with them; for it is a simple corollary from this that the conclusions of science must also be understood in terms of the methods used to establish them, so that the reliability of the conclusions must be a function, first and last, of the character of the methods. That is why Peirce found unacceptable theories of atomic facts and sensory simples as indubitable objects of knowledge, or the pretensions of philosophers to map the limits and possible objects of science – for each of these illustrates a dogmatism which blocks the road to inquiry, and to block this road was for Peirce the least forgivable and most dangerous intellectual vice.

Peirce was one of the earliest proponents of the frequency interpretation of probability statements, and though contemporary formulations of that view are superior to his, what he has to say on the general theme may still be read with profit. As is well known, there is still disagreement among competent students as to the scope of the frequency theory of probability and its relation to the procedures of induction. Peirce's views on this point, though not free from difficulties, suggest promising lines of inquiry.

> "The true guarantee of the validity of induction," he declared, "is that it is a method of reaching conclusions which, if it be persisted in long enough, will assuredly correct any error concerning future experience into which it may temporarily lead us.... It may be conceived, and often is conceived, that induction lends a probability to its conclusion. Now

> that is not the way induction leads to the truth. It lends no definite probability to its conclusion. It is nonsense to talk of the probability of a law, as if we could pick universes out of a grab-bag and find in what proportion of them the law held good.... The justification for believing that an experimental theory which has been subjected to a number of experimental tests will be in the near future sustained as well by further such tests as it has hitherto been, is that by steadily pursuing that method we must in the long run find out how the matter really stands. The reason that we must do so is that our theory, if it be admissible even as a theory, simply consists in supposing that such experiments will in the long run have results of a certain character."[9]

Peirce's writings on induction are not uniformly clear, but in the main they are consistent with his insistence upon the character of the *method* used to test them as providing the only identifiable ground for regarding the theories of science as reliable.

Toward the end of his life Peirce enumerated a number of tenets which he regarded as fundamental to his version of prag matism, and which set him off from other thinkers. The list included the following: the denial of necessitarianism; the rejection of any "consciousness" different from a visceral or other external sensation; the acceptance of the notion of infinity as significant; the acknowledgment that there are real habits which would produce effects under circumstances that may not happen to get actualized; and the insistence upon interpreting all hypostatic abstraction in terms of what they would or might come to in the concrete.[10] It is dangerous, I know, to try to force a fluid and developing movement into the framework of a set of rubrics devised for another purpose; nevertheless, it seems to me that on these points contemporary logical empiricism differs from Peirce only in relative emphasis and mode of presentation, and stands closer to him than did most of his own contemporaries. It is not improper, therefore to claim him as a spiritual ancestor of the movement which this congress represents, and as an important formative influence upon the development of at least its American participants.

Peirce once evaluated his own work as follows: "Just as there are many fogies – old and young – who with idle conservatism dispute the value of my work, so, unless the whole congregation of logicians experiences a regeneration, I expect the day will come when another generation of old and young fogies will be equally indisposed to admit that there is any corner of the whole field that I have not turned up, and put into the right condition."[11] The density

[9] 2.769, 2.780, 5.170.

[10] 6.485.

[11] 6.319.

of old and young fogies among logical empiricists is I think vanishingly small, and there is probably no one among its members and sympathizers who would accept Peirce *in toto*, or who would not acknowledge him to have been mistaken on a number of fundamental points, such as his naive conception of absolute space, his curious apriori deduction of the types of actual physical forces, or his failure to note the regulative and definitory function of a number of scientific principles. We can nevertheless honor him with clear conscience for what he achieved of lasting value. Were he still among us he would surely have endorsed the happy marriage of the cultivation of logic and the empirical temper which distinguishes this movement, and he would have joined hands with us in furthering the quest for and the understanding of progressively more adequate tools of inquiry.

THE ESSENCE OF PEIRCE'S SYSTEM

Paul Weiss. "The Essence of Peirce's System." *Journal of Philosophy* 37.10 (9 May 1940): 253–264.

I

It is somewhat of a misfortune – though not without its compensations – for a great philosopher to win no disciples during his lifetime.[1] With no one to expand and apply his main doctrines sympathetically and conscientiously he is likely to lose a grasp of the full meaning of his own views. Unable to see his basic theories in new settings, he is forced to move painfully from position to position with no guide but that provided by a flickering and uncertain vision. The living philosopher needs disciples to give him ballast and balance; the disciples need him to give them insight and direction. It was Peirce's and his contemporaries' tragedy that he had friends and well wishers, but none who both sympathized and understood.[2] It is therefore a remarkable fact that he should have been able to hold so long and so steadily to the same views and could develop them with so much consistency and thoroughness. Yet how much might he (and incidentally we and his contemporaries) have gained had James, who sympathized so much, understood him better? Contrast, for example, "I yield to no one in admiration of his genius ... he's a genius, and I look forward with avidity to his work,"[3] and "There is no more original thinker than yourself in our generation. You have personally suggested more important things to me than perhaps anyone I have known,"[4] with "I have been to C. S. Peirce's lecture which I could not understand a word of, but rather enjoyed the sensation of listening to for an hour,"[5] and the strange description[6] of Peirce's elementary "Lectures on Pragmatism" as "flashes of brilliant light relieved against Cimmerian darkness."[7]

[1] Read in part at the special session on Peirce at the joint meeting of the Eastern and Western Divisions of the American Philosophical Association held at Columbia University, December 29, 1939.

[2] But see G. Stanley Hall's article in *Mind*, Vol. IV (1879), p. 102.

[4] *Ibid.*, p. 414.

[5] *Ibid.*, Vol. I, p. 231.

[6] *Pragmatism*, p. 5.

[7] But cf. also Perry, *op. cit.*, Vol. I, pp. 292, 296, 321, 332, 363, 536; Vol. II, pp. 117, 375,

It is perhaps a greater misfortune, however, for a dead philosopher to win disciples – a tragedy for us and those who follow after. His followers mould his remains into shapes which conform to the passing fashions of the day, or dissect him into a multiplicity of minor and apparently conflicting views. And when those views pass, we risk the loss of the philosopher altogether. With the decline of the Academy we almost lost Plato; Aristotle was almost swept away with the flood which drowned the scholastics; with the decay of objective idealism, Kant and Hegel became men whom we were asked to go around and not through.[8] It is not necessary to place Peirce in the rank of these to remark that he too was a philosopher and is about to be lost to us in similar ways.

I am not concerned with praising Peirce – that would be impertinent – but in doing honor to him on this the hundredth anniversary of his birth. And I can think of no better way than to call to mind that once before he was on the verge of being kidnapped and dismembered.[9] Perhaps it is not too late to remark that the attempt to reduce him wholely to the status of one of the founders or major figures in the development of a symbolic logic, a science of signs, a positivism, empiricism, nominalism, or pragmatism is mischievous and misconceived. Peirce was a metaphysician as well as a logician, a realist as well as a semiotician, a speculative thinker as well as an experimental scientist, an idealist as well as a naturalist, and a pragmatist who had a theory of ethics which acknowledged a fixed and universal ideal. These were not for him, and ought not be for us, inconsistent positions. Truth is rich and complex enough to accommodate both the abstract and the concrete, the temporal and the eternal, the general and the specific, the absolute and the relative, the probable and the certain. Peirce was a philosopher precisely because he saw that these different factors were facets of one encompassing truth and reality, and that philosophy was not a point of view but a study of that which embraces all points of view.

II

Metaphysics, for Peirce, is a sub-order of philosophy. Philosophy is a sub-class of the science of discovery, and this in turn is a branch of theoretical science.[10]

416, 418, 436, 438, 439, and 645. Perry's comments in these places – and particularly in Vol. I, pp. 533, and Vol. II, pp. 406ff – seem to me to obscure rather than to clarify the nature of Peirce's thought and his relation to James. This is especially true of the account of Peirce's tychism and synechism in Vol. II, pp. 411–412.

[8] See, e.g., William James's *Collected Essays and Reviews*, p. 437, and John Dewey's *Characters and Events*, Vol. I, pp. 63–68.

[9] See *Collected Papers of Charles Sanders Peirce*, edited by Charles Hartshorne and Paul Weiss, 5.414.

[10] See 1.239ff, 1.282, 6.6.

The function of metaphysics is to explain the variety of the universe. "The universe has an explanation, the function of which ... is to unify its observed variety."[11] Its data is observable by every man at every moment.

> Metaphysics, even bad metaphysics, really rests on observations, whether consciously or not; and the only reason that this is not universally recognized is that it rests upon kinds of phenomena with which every man's experience is so saturated that he usually pays no attention to them. The data of metaphysics are not less open to observation, but immeasurably more so, than the data, say, of the highly developed science of astronomy. [6.2] Philosophy contents itself with observations such as come within the range of every man's normal experience and for the most part in every waking hour of his life.... These observations escape the untrained eye precisely because they permeate our whole lives, just as a man who never takes off his blue spectacles soon ceases to see the blue tinge.[12]

It is impossible to dispense with metaphysics; all one can do is to replace one metaphysical view by another. "Every man of us has a metaphysics, and has to have one.... There is no escape from the need of a critical examination of 'first principles'."[13] To reject metaphysics is to exhibit a preference for a dogmatic view instead of for a carefully developed, self-conscious, and self-reflective one.

> Find a scientific man who proposes to get along without any metaphysics – not by any means every man who holds the ordinary reasonings of metaphysicians in scorn – and you have found one whose doctrines are thoroughly vitiated by the crude and uncriticized metaphysics with which they are packed. [1.129]

Every science, in fact, presupposes propositions beyond its power to evaluate.

> The special sciences are obliged to take for granted a number of most important propositions, because their ways of working afford no means of bringing these propositions to the test. In short, they always rest upon metaphysics.[14]

[11] 1.487. In 1.405, however, Peirce remarks that "There is a class of facts of which it is not reasonable to expect an explanation, namely facts of indeterminacy or variety." These two statements are not really in conflict. The former refers to the meaning of the variety, the latter to its occurrence.

[12] 1.241. See also 6.5.

[13] 1.129.

[14] 1.129.

When, then, some moderns define all metaphysical discourse as contraband they are merely asking for the privilege of allowing their own metaphysical preconceptions to go unexamined and uncriticized.[15]

III

Metaphysics, for Peirce, differs from the special sciences only in its inescapability, evidence, and generality, and agrees with them in being dependent on mathematics, phenomenology, esthetics, ethics, and logic.

According to him, it is dependent on logic in a two-fold way. It is concerned with problems whose resolution requires maturity, if not subtlety, of thought. "Metaphysics is a most difficult science, presenting more pitfalls for the uninformed than almost any, which a mere amateur at it would be foolish to fancy that he could escape."[16] "Metaphysical philosophy has no work that *hard thinking* can do. What is needed above all, for metaphysics, is thorough and mature thinking."[17] One who is unable to use the powerful and effective instrument of modern logic, particularly the logic of relatives, is bound to be trapped in the paradoxes and prejudices of the past.

> Unless the metaphysician is a most thorough master of formal logic – and especially of the inductive aide of the logic of relatives ... he will inevitably fall into the practice of deciding upon the validity of reasonings ... by the impression those reasonings make upon the mind.... Just look at the dealings of the metaphysicians with Zeno's objection to motion.... The metaphysician who is not prepared to grapple with all the difficulties of modern exact logic had better put up his shutters and go out of trade. [1.624]

> A metaphysics not founded on the science of logic is of all branches of scientific inquiry the most shaky and insecure. [2.36]

Secondly, as both Aristotle and Kant recognized, metaphysical concepts should be adaptations of logical ones.

> If the theory of logic which is to be developed in this book has any truth, the position of the two greatest of all metaphysicians, Aristotle and Kant, will herein be supported by satisfactory proof, that that science

[15] See my "Metaphysics: The Domain of Ignorance," *Philosophical Review*, Vol. XLIII (1934), pp. 401–406; *Reality*, pp. 93–95.

[16] 1.204.

[17] 3.406.

> [metaphysics] can only rest directly upon the theory of logic. Indeed it may be said that there has hardly been a metaphysician of the first rank who had not made logic his stepping stone to metaphysics. [2.121.]
>
> The only rational way would be to settle first the principles of reasoning, and that done, to base one's metaphysics upon those principles. [2.166.]
>
> Metaphysical conceptions ... are merely adapted from those of formal logic. [1.625.]
>
> Metaphysics consists in the results of the absolute acceptance of logical principles not merely as regulatively valid but as truths of being.[18]

Peirce's metaphysical categories, chance, law, and continuity,[19] seem to be adaptations of the three basic inferential processes of abduction, deduction, and induction.[20] The power, growth, and self-corrective nature of logic, and particularly of induction, seem to be the clue to his view that all the elements of the universe are being gradually solidified into a single rational whole.

> Synechism [i.e., continuity] is founded on the notion that the coalescence, the becoming continuous, the becoming governed by laws, the becoming instinct with general ideas, are but phases of one and the same process of the growth of reasonableness. This is first shown to be true with mathematical exactitude in the field of logic, and is thence inferred to hold good metaphysically. [5.4.]
>
> Metaphysics is the science of reality. Reality consists in regularity. Real regularity is active law. Active law is efficient reasonableness, or in other words is truly reasonable reasonableness. Reasonable reasonableness is Thirdness as Thirdness. [5.121.]

(That induction is a form of Thirdness as Thirdness is evident from 2.89–96.)

Peirce, however, was very insistent that it would be wrong to rest logic on metaphysics.[21] "To found logic on metaphysics is a crazy scheme."[22] He would have found even more to object to in Dewey's attempt to found it on

biology or the practices of scientists. Logic was abstract, formal, with its own laws and conditions; he could see no rationale in making it dependent on the concrete, the specialized, the contingent, and fallible. Peirce reviewed the *Studies in Logical Theory*[23] and observed that it could not offer an adequate norm of what was valid or not. He would comment on Dewey's later work perhaps to the effect that pragmatism or instrumentalism can not determine, but must presuppose, a logic, and that the attempt to deal with logic in any but its own terms would destroy its value as a support of the exact sciences.[24]

Peirce's insistence on the priority of logic prevented him from affirming that there was a deep and important sense in which logic rested on metaphysics as surely as metaphysics rested on logic. But, he himself was able to affirm that logic was social in its essence[25] only because he had already rejected the Leibnizian universe of monads. "Leibnitz is a pure individualistic nominalist" (6.393). He could view the laws of logic as habits[26] only because he held that laws and universals were real.[27] Logical laws on any view must have some kind of being; realities on any view must have some kind of rationale. For an evolutionary philosopher such as Peirce,[28] logic and metaphysics must be but different ways of expressing the truth that the world has a progressively rational structure capable of being mastered by beings who are becoming more and more reasonable.

> We have, as a deduction from the principle that thought is the mirror of being, the law that the end of being and highest reality is the living impersonation of the idea that evolution generates. [1.487.]

> What we think of cannot possibly be of a different nature from thought itself. For the thought thinking and the immediate thought-object are the very same thing regarded from different points of view.[29]

IV

Because his logic and his metaphysics were intimately connected, Peirce had no difficulty in resolving what today is termed the "semantic" problem of the

relation of signs to their objects. His answer in brief is contained in his observation that an object is itself a kind of thought or sign.

> Every sign stands for an object independent of itself; but it can only be a sign of that object insofar as that object is itself of the nature of a sign or thought. For the sign does not affect the object but is affected by it; so that the object must be able to convey thought, that is, must be of the nature of a thought or sign. [1.538.]

Signs duplicate the structure of, interact with, or, in the ideal case, embody the same laws or habits that their objects do. It was his view that the entire cosmos was overrun with signs,[30] and that every thought,[31] law,[32] and man[33] was a sign, i.e. an entity which had meaning only in terms of some other more comprehensive and rational sign which welded the totality of things and beliefs together into fixed and perfect whole.

> What anything really is, is what it may finally come to be known in the ideal state of complete information, so that reality depends on the ultimate decision of the community; so thought is what it is only by virtue of its addressing a future thought which is in its value as thought identical with it, though more developed. [5.316.]

> The very origin of the conception of reality shows that this conception essentially involves the notion of a COMMUNITY, without definite limits, and capable of a definite increase of knowledge. [5.311.]

Peirce never gave sufficient weight to the fact of individual existence[34] and undoubtedly exaggerated the place that signs occupied in men and things. But what is important today is the fact that his firm realism prevented him not only from having difficulty with semantics, but of committing the modern error of supposing that the laws of logic were arbitrary or conventional, or that "pragmatics" had to do with the "action, state and environment of a man who speaks or hears."[35] The heart of the pragmatic maxim lies in its interpretation

[30] "The entire universe ... is perfused with signs, if it is not composed exclusively of signs" (5.448n).

[31] "Thought is in itself essentially of the nature of a sign" (5.594).

[32] "A law is in itself nothing but a general formula or symbol" (5.107).

[33] "Man is the thought" (5.314). "A human being ... is a sign himself" (6.344).

[34] "Individualism and falsity are one and the same" (5.402n). See also 5.503.

[35] See Carnap's "Foundations of Logic and Mathematics" International Encyclopedia of Unified Science, vol. 1, number 3, p. 4.

of the meaning of concepts as involving a reference, not to the particular or existential, but to the rational or general.

> If it be admitted that action wants an end, and that that end must be something of a general description, then the spirit of the maxim itself, which is that we must look to the upshot of our concepts in order rightly to apprehend them, would direct us towards something different from practical facts, namely to general ideas, as the true interpreters of our thought. [5.3.]

> The most perfect account of a concept that words can convey will consist in a description of the habit which that concept is calculated to produce. [5.491.]

V

Peirce was a laboratory scientist who had made careful experiments with the pendulum and long and detailed observations in astronomy and on weights and measures.[36] Perhaps that is the reason he refused to exaggerate the evidence, purity, independence, or universality of science. The premises of science, Peirce saw, were directly observable, the conclusions not.

> We cannot see energy, nor the attraction of gravitation, nor the flying molecules of gasses nor the luminiferous ether, nor the forests of the carbonaceous era, nor the explosions in the nerve cells. [6.2.]

If then it is observables with which we are really concerned we ought to devote ourselves to phenomenology and metaphysics. He saw too that the development of science was determined in part by the costs of experimentation,[37] the ethics of its practitioners[38] and by their unexamined preconceptions.[39] He

[36] The volume containing this material is almost ready for publication and has been for some time. It is doubtful, however, in view of the slow, though progressive, sale of the earlier volumes, whether it will be published in the near future. There is a biography, incidentally, of Peirce in the *American Dictionary of Biography*; autobiographical comments are to be found in the published volumes, indexed under "autobiographical references" in the Index of Subjects.

[37] "It does not pay (in any given state of science) to push the investigation beyond a certain point in fullness and precision" (1.122).

[38] "There is an ethics indissolubly bound up with it [science] – an ethics of fairness and impartiality" (6.3).

[39] See, e.g., 1.109, 1.204.

was clear and insistent on the fact that the special sciences presuppose work in metaphysics, logic, ethics, esthetics, phenomenology, and mathematics,[40] for these deal with their preconceptions, provide them with their norms, ends, and distinctions, and mark out the realm of the things that are really possible. The scope of science, he saw, was far from universal; it could "no more deny a miracle than it could assert one,"[41] nor determine the nature of the distinction between fact and fancy.[42] He was inclined to exaggerate its uselessness ("true science is distinctly the study of useless things"[43]) and to make a fetish of the word[44] but that did not, fortunately, prevent him from seeing that it is the proper pursuit only of those who are imbued with a sincere desire to learn,[45] and that it would be inconsistent with that desire to block the road of inquiry by making arbitrary decisions as to what can and can not be known.[46] No one imbued with a love of knowledge would try to deny truths and inquiries because they were uncongenial,[47] and no one who had reflected could term himself a "fallibiist" without recognizing the metaphysical truth that there were real laws of nature which changed and grew.[48]

VI

It was this interpretation of the nature of laws which made it possible for Peirce to be both a naturalist and an idealist. All naturalists and most idealists, I suppose, deny that there are any completely transcendent realities; both can affirm the existence of regularities in nature. They diverge perhaps primarily on the question as to whether matter or mind, efficient or final causation, provides the clue to the secrets of the universe.[49] Peirce, who held that his philosophy "resuscitated Hegel" (1.42) and that matter was habituated mind (6.25) was obviously

[40] See 1.183f, 1.249–250.

[43] 1.76. See also 1.55, 1.618.

[44] See 5.384f where the method of determining beliefs by something real is perversely identified as the method of science and science alone. See also 1.183ff where phenomenology, ethics, esthetics, logic, and metaphysics are described as positive or experimental sciences.

[45] "It is not knowing, but the love of learning, that characterizes the scientific man" (1.44).

[46] See 1.135ff.

[47] See 1.57.

[48] See 1.173f.

[49] Cf. 6.24, 1.220.

an idealist. But since he held that matter existed, that it was subject to efficient causation, and that laws were immanent in things, he was obviously a naturalist as well. He reconciled the two by showing their interdependence, while leaning towards the idealistic account.

> Final causation without efficient causation is helpless.... Efficient causation without final causation, however, is worse than helpless, by far; it is mere chaos. [1.220.]

> Physical evolution works towards ends in the same way that mental action works towards ends, and thus in one aspect of the matter it would be perfectly true to say that final causation alone is primary. Yet, on the other hand, the law of habit is a simple formal law, a law of efficient causation; so that either way of regarding the matter is equally true, although the former is more intelligent.[50]

Naturalism might, however, be defined as the view which attempts to explain everything by the operation of force, combination, or aggregation. If this be its meaning, then Peirce not only supplements it with an objective idealism which insists on the presence of an element of law, mind, or rationality in the universe, but with a subjective idealism or empiricism which stresses the element of immediacy. Peirce insisted on all three, and thereby resuscitated Hegel, but "in a strange costume" (1.42).

> Had Hegel, instead of regarding the first two stages with his smile of contempt, held on to them as independent or distinct elements of the triune Reality, pragmaticists might have looked up to him as the great vindicator of their truth.[51]

It is strange that Peirce did not see that in making this change he also resuscitated and transformed both the traditional naturalism and the traditional empiricism and subjectivism. All three views require and supplement one another.

We have now reached what I think is the essence of Peirce's system. From the beginning to the end of his career he devoted his energies to developing and applying the doctrine that there were three basic and irreducible categories – being, opposition, and reason, or immediacy, action, and mediation, or, as he preferred to say, Firstness, Secondness, and Thirdness. Suggested originally by Kant[52] they were justified by logic and observation, and eventually became

[50] 6.101. See also 1.437.

[51] 5.436; see also 5.91.

[52] See 1.563.

the clue for him to the classification of the sciences, the fundamental divisions of semiotics, metaphysics, and logic, and suggested to him the nature of the object of esthetic inquiry.

Each of these categories should be viewed as prior to and explanatory of the others.[53] The immediate is the aboriginal, the first in the order of evolution,[54] "the most primitive, simple and original of the categories" (2.90). The existential or active is first in the order of fact, the locus of both the immediate and the rational. "Existence is dyadic" (1.329) and as present must be a first (2.85, 1.341) and as intelligible must embody a third (5.431). The third is first in meaning, relating and completing the others.[55] Each category is something in itself, each is distinct from and contrasted with the others, and each is intrinsically intelligible.[56] Peirce, however, was unfortunately too dominated by the Kantian and Hegelian values to give sufficient weight to the first two categories. Otherwise he might have been more ready to describe them all as views or perspectives on the whole of things, each embracing and being embraced by the others. Instead he stressed the third category and never explicitly took it to be subsidiary to the other two.

VII

Peirce's stress on Thirdness with his coordinate acknowledgment of the other two categories, is evident in his account of pragmatism. Pragmatism, for him, is a method of evaluating hypotheses[57] or "firsts" in terms of an ultimate end, or "second."[58] Peirce shifted his emphases from time to time, and as the years went on found more and more features which differentiated his views from others,[59] but, throughout, his doctrine seems to be marked off by its recognition of the basic role which rationality, order, continuity, and habit play in the interpretation of a concept. "I was speaking [in my original pragmatism paper] of meaning in no other sense than that of *intellectual purport*, ... or adequate proper interpretation of any symbol."[60] Here he seems to be one with Dewey. But he differs from Dewey in remarking that pragmatism,

[53] See 2.89ff.

[54] See 1.490, 1.474.

[55] "Thirdness is that which is what it is by virtue of imparting a quality to reactions in the future" (1.343). See also 5.91.

[56] 2.89f. But see also 1.353, 1.530.

[57] 5.196.

[58] 4.539.

[59] 5.423.

[60] 5.402n. See also 5.3, 5.429.

instead of refusing to acknowledge the reality of a fixed and ultimate end of action, is inevitably forced to acknowledge one. "In order to understand pragmatism," he remarks, "it is incumbent upon us to inquire what an ultimate aim, capable of being pursued in an indefinitely prolonged course of action, can be."[61] He thinks it is the "free development of the agent's own esthetic quality" in a state of freedom from disturbance by the external world.[62] The proof of this he thought only metaphysics could provide. If he is right, then pragmatism, instead of eliminating metaphysics, depends for its very meaning on the successful pursuit of metaphysical inquiry. Certainly something like this view is necessary if pragmatism is to be an effective and rational method for directing inquiry, for without some definite and ultimate end in view we can do nothing more than experiment and experiment without knowing why we should.

But more important is the fact that once the first and second categories are recognized to have a status equal to that of the third, there ought to be a kind of pragmatism whose function is to unite action and reason by means of an intuition into ideals, and another kind whose function is to relate feeling and reason dynamically by way of action. The former would be a pragmatism in the realm of ends, the latter a pragmatism in the field of conduct. They would be methods by which we clarified, not our concepts, but our efforts and our emotions, and these, not by intellectual devices, but by insight, on the one hand, and ethical behavior on the other. Peirce rightly insisted that the only proper way to "clarify" ideas was by means of other ideas. But what, apart from a rationalistic prejudice, prevented him from seeing that there was an analogous way in which intuition clarified the meaning of action and ethical conduct clarified the nature of feeling? Most of Peirce's limitations, as I see it, follow from the fact that he never adequately saw that the first and second categories were as basic and as revelatory as the third. If this be true, then the importance of Peirce for the future will lie in his capacity to provide the basic material and distinctions by which his own insights can be completed and transcended.

VIII

There are many important matters on which I have not touched, such as Peirce's "critical common-sensism," his logic of abduction, his distinction between logic and mathematics, and his views on psychology, theology, perception, and history. Many passages too can undoubtedly be produced which seem to, and perhaps actually run counter to, those here quoted or

[61] 5.135.

[62] 5.136.

expressed. Neither of these is, I think, a serious matter. The relation between what has here been included and what neglected can, I think, be easily discerned from the published papers;[63] the contradictions and wobblings in position reveal, I think, little more than that philosophers, like other men, are human and fallible. Nor would it be serious if the present thesis that Peirce was a systematic, comprehensive thinker, should find no favor. Systems perhaps are important primarily because they provide an opportunity for systematic criticism, appreciation, or improvement. What would be serious would be the reduction of Peirce to the level of a "seminal mind," the full flower of which we are today enjoying, for that would mean that Peirce had no place among the perennial philosophers, and must be defined as one who already is, and in a deep and regrettable sense, was always out of date.

[63] The passages referred to in this essay often contain, not only references to other places where the points here made are reaffirmed or elucidated, but explicit comments on questions which have not been here discussed. Nothing less than a full use of these references would provide and adequate grasp of the heart of Peirce's views. In this sense, the present paper can pretend to give only an outline of the essence of the system, and but the barest hint of its richness and variety.

THE ACCIDENTS OF PEIRCE'S SYSTEM

Justus Buchler. "The Accidents of Peirce's System." *Journal of Philosophy* 37.10 (9 May 1940): 264–269.

Professor Weiss contends in the preceding article that Peirce's philosophical contributions acquire their essential significance when regarded as elements of a system. He believes that if the system is "dissected" or "dismembered" its constituent theories are in danger of assimilation and inevitable distortion by philosophic factions. This, of course, presupposes what has so often been contested, that all the theories are compatible. Professor Weiss admits that quotations contradicting his own can be advanced, but belittles their importance. Probably he would not claim that he had established the validity of the systematic interpretation, but that he had begun what could be completed.

Why Professor Weiss should dread abstraction from Peirce is not clear. Whatever cumulative growth there has been in the stream of classical philosophy has been achieved not by modifying a ready-made system, but by the partial or limited acceptance of a given philosopher's work through discriminating selection, and this where the homogeneity of the previous system was far greater than in Peirce. Kant, for instance, could extend the philosophic horizon by abstracting from philosophers of widely opposite tendency, and we do not have to be told today of the possibility, in fact the advisability, of profiting from Kant while freeing ourselves from the outlines of his system. Only as thus assimilated can theories contribute to that progressive growth of cooperative philosophizing which Peirce so ardently desired. As for the evil of distorted interpretation, it is as likely to befall an entire system as a single theory. Professor Weiss's interest in preserving the distinctive character of Peirce's philosophy, its esthetic quality as a unique historical whole, perhaps reflects a preference of his own for individualism in philosophic method.

Peirce himself did intend a grand system. I am not here concerned with any exhibition of inconsistencies, though I can not refrain from remarking that he who establishes the internal congruity of a philosophy of common sense with an anthropomorphic panpsychism will prove himself very dexterous indeed. There is a much more serious consideration. It could be shown, by a sufficiently detailed analysis, how vicious are the consequences of interpreting Peirce's individual theories primarily in terms of their place in his total scheme; how, for example, we should misunderstand the conception of falli-

bilism if we took seriously an assertion that it is closely tied up with metaphysical evolutionism. The reason is that the better of the theories were developed as answers to specific problems, and the results of such inquiries do not respect esthetic demands. Certainly any collection of opinions can be harmonized if we are willing to pay the price of obscurity. In Peirce the price is great, and it is doubtful that we can make the alternative claim of poetic value for the system. But it is with hesitation that one warns of obscurity, because philosophers apparently disagree more than ever on what is and is not obscure. Thus Professor Weiss considers James's appraisal of the Lectures on Pragmatism ("flashes of brilliant light relieved against Cimmerian darkness") a "strange description" of an "elementary" work, while to me it has always seemed that no description could be more accurate.

In controverting the alleged "intimate connection" between the phenomenology, logic, and metaphysics of Peirce, I must appeal to the very unsubtle distinction between what Peirce says and what Peirce does. We can find him to say almost anything somewhere or other. He might, for example, tell us that pragmatism "cannot be understood" unless such-and-such a principle is presupposed. If, however, after examination it proved to be the case that in the great series of papers on pragmatism or on the logic of empirical science it *was* stated and *was* understandable without employing that principle, this would illustrate what I mean by distinguishing between his saying one thing and doing another; and his saying what he says could reasonably be explained as an *obiter dictum* designed to help unify his projected system. What do we find when we use this procedural criterion?

(1) Peirce *speaks* of pragmatism in one breath with metaphysics and ethics, but any reader can confirm the fact that the *actual formulation* of pragmatism, as the principle of interpretation that he intended it to be, is rooted in logic or general semiotic alone. Procedurally examined, it becomes clear that the various papers on pragmatism are elaborate attempts to define a certain sub-class of "logical interpretants" of a sign.[1] (Cf., e.g., 5.464–496.) More than once Peirce says that pragmatism assumes the truth of synechism, the principle of continuity. Now, is not synechism one of the foundations of Peirce's metaphysics? No doubt – but this does not mean that it must itself be a metaphysical assertion. And, in fact, when Peirce makes statements like those relating it to pragmatism, he is thinking of it as a methodological principle, which is precisely what he defines it as in Baldwin's *Dictionary*: "Synechism is not an ultimate and absolute metaphysical doctrine; it is a regulative principle of logic, prescribing what sort of hypothesis is fit to be entertained and examined" (6.173). My purpose is not to match quotations with Professor Weiss, but I must call attention to the numerous occasions on

[1] See my *Charles Peirce's Empiricism*, §§29–34, 40.

which Peirce protests that his pragmatism is "no doctrine of metaphysics" but a "logical rule" (cf. 5.18, 423, 464–5, 469; 4.534; 6.482, 490, etc.).

(2) Peirce does say, as Professor Weiss points out, that the sciences must turn to metaphysics for certain of their assumptions, but he never says that they must turn to any but the scientific *method*; on the contrary, he is unwaveringly insistent that "Philosophy ought to imitate the successful sciences in its methods" (5.265). Pragmatism was intended to be the logical instrument enabling it to do this. After its divorce of the genuinely problematic from the pseudo-problematic, "what will remain of philosophy will be a series of problems capable of investigation by the observational methods of the true sciences" (5.423). Moreover, pragmatism is based on a study of science, and is not a methodological legislator to science. The pragmatic method "is no other than that experimental method by which all the successful sciences (in which number nobody in his senses would include metaphysics) have reached the degrees of certainty that are severally proper to them today" (5.465). To say, as Professor Weiss does, that for Peirce the various branches of philosophy "provide" the special sciences "with their norms, ends and distinctions," is quite evidently a misconstruction.

(3) Peirce sometimes does make semiotic distinctions in phenomenological terms, but he does not *have to* do so, and he can and *does* make the same distinctions in logical terms alone. The distinction between different kinds of signs is not arrived at as the result of phenomenological analysis; the case is rather that, once the distinction is made, phenomenological analysis will *discover* in it a manifestation of the three categories, just as it can find them manifested in anything whatsoever that is given to it. Sign distinctions, classifications, and analyses are made by observing "such signs as we know" (2.227), abstracting certain characteristics, and concluding what must hold good of all signs. This logical process Peirce calls "abstractive observation" or "ideal induction" (or "ideal experimentation"). It is, according to him, the instrument of mathematical reasoning; and certainly mathematics, whether in his scheme, in his procedure, or in universal estimation, is independent of phenomenology. The plain fact of the matter is that a far better case can be made out for the view that in Peirce the basic principle of phenomenology, the distinction of the three categories, is suggested by a distinction within purely formal logic – that of the monadic, dyadic, and triadic forms of predicates (rhemata) in the logic of relatives (cf. 3.63, 3.422, 5.469). A First may be unambiguously defined as that character which would be expressed by some statement about a quality, a Second as that character expressible by a statement of a dyadic relation, a Third as that character expressible by a statement of a triadic relation; or, to use Peirce's language, the categories are the three classes of characters defined respectively by "absolute," "simple relative," and "conjugative" predicates. It is significant that when Peirce gives his demonstrations that there can be no more than three classes of

indecomposable categories or predicates, these proofs are not based on phenomenological or metaphysical grounds but have, as he emphasizes, a purely logical or mathematical character (e.g., 1.346–7, 1.561–2, 3.63, 3.421–2).

In view of the foregoing it is difficult to understand what Professor Weiss means when he calls the doctrine of the categories "the essence of Peirce's system." What are these categories, anyway? Peirce vacillates between an ontological and a methodological conception of them. When he describes them as quality, fact, and thought, or as spontaneity, opposition, and reason, or in terms of any other such triad of concepts, he appears to warrant the former interpretation. But that he did not intend such an interpretation is clear both from his explicit declaration that phaneroscopy (phenomenology) "has nothing to do with the question of how far the phanerons it studies correspond to any realities" (1.287) and from the fact that he coined for the categories the neutral names of Firstness, Secondness, and Thirdness. The purpose of coining these names was to establish the most general possible means of discriminating all other concepts. Firstness, Secondness, and Thirdness are concepts which enable us to classify, organize, and describe any kind of experience (whether it consists in the smell of rotten cabbage or the experience of mathematical reasoning), and they are applicable to all other concepts for this reason. Peirce *has* ontological categories: mind, matter, and evolution; chance, law, and habit-taking. But these are simply one manifestation of the categories, neither more nor less significant than others, like the logical concepts of abduction, deduction, and induction, or icon, index, and symbol. In the special sciences, the psychological concept of feeling, for example, is a First; the biological concept of heredity is a Second; and so on (cf. 6.32).

A moment's reflection will show that neither the metaphysical nor the methodological interpretation sheds light on the assertion that the doctrine of the categories is "the essence of Peirce's system." Is it the essence of the system because it suggests to him (granting this questionable point) how the sciences should be classified? We might as well argue that the concept of abduction is the essence of the system because the principles of all the sciences are hypotheses and all hypotheses are the results of abduction. Does it help to define the meaning of concepts in other subject-matters? But while induction, for example, is said to exemplify Thirdness, it would be as fantastic to suppose that Peirce formulates his principle of categories with the help of the principle of the categories as to suppose that he formulates principles of the special sciences in this way simply because he categorizes their concepts.

If Professor Weiss's purpose in locating the "essence" of Peirce's system is to discover the "first principles" on which this system rests, he is grossly misled by Peirce's classificatory scheme, in which phenomenology is "order 1" of philosophy. Peirce's actual philosophic practice accords not with this scheme

but with his fallibilism and experimentalism. One of the eloquent lessons of fallibilism is that no intellectual discipline whatever can have an absolute foundation. Neither the principle of the categories nor any other is the fountain or starting-point of his philosophy. His aim was much less to establish a fixed structure for his "system" than to discover as many independent sources of confirmation as he could for all the theories that constituted it. Order he recognized as an essential of intellectual economy, "as of every other" (5.392), but disproportionate attention to order is precisely his criticism of the classical philosophers; and accordingly he placed himself in the ranks of "laboratory" as opposed to "seminary" philosophy. He would hardly subscribe to the vague account of philosophy attributed to him by Professor Weiss, "a study of that which embraces all points of view." However prosaic some among us may judge him to be, the fact is that he conceived of philosophy as a science which like any science must learn to employ stern canons for the discrimination of evidence, and the ultimate goal of which is universal agreement and a uniform terminology rather than poetic expression of individual perspective. Striking testimony of faithfulness to the scientific ideal is his habit of pointing out and painstakingly correcting specific errors that he had committed in earlier papers.

Professor Weiss believes that Peirce "is about to be lost to us." It may be that by neglecting the systematic element in Peirce we are in danger of overlooking some interesting possibilities. But a much greater danger lurks, that of petrifying his philosophic researches, as we seem to have petrified Royce's. To strain principally for the conservation of his picturesque architectonic will scarcely be to provide the corrective which he lacked while alive. It would be better to honor him in the act, learning from the rich conceptions and potentialities of his thought by intelligent dissection rather than by the esthetic contemplation of their dubious unity.

INTRODUCTION

William James was born in New York City on 11 January 1842. His father, Henry James Sr., was a wealthy and religious intellectual who had close relationships to many prominent literary figures, including the transcendentalist Ralph Waldo Emerson. The origin and justification of faith in personal religious experience, a central principle for Protestantism and transcendentalism, became James's own philosophical view. James's father provided his children with an unusual education while the family lived in a variety of cities across America and Europe. His younger brother, Henry James, became one of America's most important novelists whose writings display a deep affection for European culture. William's own preference was for America and its peoples' love of adventure and invention.

After abandoning painting, James studied biology, quickly accepting Darwin's theory of evolution. He pursued a medical degree at Harvard University and graduated with the M.D. in 1869. In 1872 James began teaching physiology at Harvard, but his primary interest was psychology, especially the physiological and experimental psychology that he had seen during earlier travels to Europe. James was permitted to teach this psychology at Harvard starting in 1875, and he founded the first psychological laboratory in America. Since psychology theorized about the mind's operations, it was then considered as a part of philosophy, and James became a professor of both psychology and philosophy. Through the 1880s he wrote about consciousness and the functions of the mind, and published *The Principles of Psychology* in 1890.

The Principles of Psychology is still the most important and provocative psychological text ever written by an American. John Dewey's philosophy was deeply influenced by this work. Some of the writings of his friend Charles Peirce closely supported James's views on belief and truth. James announced in 1898 that he also was a pragmatist, and defended his version of empirical pragmatism against the other two dominant philosophies of that time, realism and idealism. His entire career was devoted to teaching at Harvard University. His most famous book, *Pragmatism*, was published in 1907. Until James's death in Chocoura, New Hampshire on 26 August 1910, he wrote about experience and mental concepts, applications of the pragmatic theory of truth to morality, religion, and science, and his vision of a pluralistic metaphysics.

Biological Mind and the Stream of Consciousness

James's pragmatism developed from his investigations into the mind's capacities. Philosophy in the 1880s and 1890s was energized by controversies that would now be called issues in "philosophy of mind" or "philosophical psychology." Responsibility for such an explosion of intense creativity and debate rests primarily on two profound developments: the rising acceptance of Darwinian evolution, and the expanding interest in psychological experimentation. They encouraged the revolutionary notion that human beings must be studied as physical organisms operating to survive in a natural environment. William James and John Dewey were the leading psychological philosophers who explored the emerging frontiers of philosophy of mind. During the 1880s and 1890s they established a novel approach to the understanding of human cognition and behavior that became known as "functionalism." This theory was broadly naturalistic, rejecting both materialism and idealism.

Functionalism is primarily defined by its thesis that psychology is the study of mental life as an adaptive organic process. This study of the mind as a natural ability is an attempt to replace Cartesian dualism with naturalism, and James and Dewey adopted a naturalistic attitude towards the human being and all of its abilities. Their kind of voluntaristic naturalism requires the existence of free will, since functionalism emphasizes the mind's ability to make decisions and control behavior. James and Dewey were unusual naturalists, because most naturalists were materialists who believed that the universe was deterministically controlled only by natural laws.

In the 19th century materialistic philosophers had little to say about the human intellectual abilities. Materialism typically reduces the mind to just the mechanical workings of the brain, or declared that consciousness is just the epiphenomenal by-products of the brain's activity. The largest contribution of materialism to modern philosophy of mind rested on its mechanistic theory of the origin of ideas. Materialism usually supported sensationalistic empiricism by locating the source of information about the world exclusively in the mechanical activities of the sense organs, stimulated in turn by the transmission of motion from forceful contact with physical bodies in nature. Information about the surrounding environment is generated by the correct kind of interaction between the natural word and the natural workings of the brain. Aside from possessing a properly working nervous system, the perceptive observer is treated as a passive receptacle of this information for which the observer deserves no responsibility or credit. Sensationalistic empiricism permits the rational manipulation of information into more complex combinations of association. But aside from the use of standard logical tools, any deviant manipulation or creation of ideas can only result in the serious risk of deception, illusion, and error.

Materialism and sensationalism prevailed over German idealisms and lingering dualisms, standing victorious across Europe from Scotland to

Austria during the middle decades of the 19th Century. But despite the obvious affinities between materialism, evolution, and psychological experimentation, their combination in the 1870s slowly eroded sensationalism's dominance. This erosion was accelerated by suddenly re-born post-Kantian idealisms which exposed the many inconsistencies and paradoxes of any empiricism which claims that knowledge of the natural world of physical objects and their lawful behavior is "built up" solely out of raw sensory materials possessing neither coherence nor meaning. Sensationalism's denial that the mind's knowing faculties help to construct the basic experiential information was opposed by idealism's counter-claim that without such constructive assistance no genuine experience of the world could occur. Evolution's perspective on the physiological role of the nervous system, and psychological experimentation on actual mental processes, decisively tipped the scales against sensationalism. Together they established that the human observer selected, filtered, and shaped experiences of the world.

This revolution replaced the passivism required by sensationalism with the activism taught by what can be termed "voluntarism." Voluntarism emphasized the role of the will in directing all human experience and activity. Voluntary actions should even encompass the acquisition of information about the environment. This goes well beyond the trivial idea that organisms must orient themselves to sources of sensations, by claiming that the very content and meaning of any experience is partially dependent on the goal-directed activity pursued by an organism. Voluntarism was compatible with idealism to the extent that they agreed that the on-going mental activities of a human being were largely responsible for the significance and meaning of one's experience. Voluntarism and idealism were unified by many philosophers in "organicism." Organicism, inspired by the German Romantic idealisms of Schelling and Hegel, rejected the materialistic and deterministic philosophy with the metaphor of the living organism. Its defense of teleological explanations of both human behavior and the natural world, permitting the existence of free will, enjoyed a renaissance in the late 19th Century.

Philosophers at the forefront of physiological and experimental psychology in Germany were typically aligned with idealism, voluntarism, and organicism. Primary examples include Gustav Fechner, Hermann Helmholtz, Hermann Lotze, and Wilhelm Wundt. The Americans who were most completely aligned with voluntaristic organicism were William James and John Dewey. However, they replaced the idealistic foundation for voluntarism with naturalism. They explicitly applied biological and physiological terms and principles to their experimental study of the mind's processes. Their philosophy of mind was developed and defended by a combination of three methods used by the science of psychology. There were three methods of psychology used in the 19th century: introspection, experimental psychology,

and physiological psychology. These methods were also used in the 20th century and are still used today, together with the newer method of behaviorism. William James used all three methods to develop his theory of psychology.

The most popular method in the 19th century was introspection, or "inner seeing," which was used by Descartes and many philosophers after him. Introspection is the attempt to focus your attention on something that you are thinking about, and then to describe what you are experiencing: sights, sounds, emotions, feelings, memories, and all of the things that can be thought. Introspection allows a person to describe the activities and the contents of one's mind. The mind's processes may be watched by introspection, but some processes might not be discovered with this method. In the 18th and 19th century, philosophers of the mind were divided into two opposed positions. Empiricists believed that all the mind's processes, from the incoming sensations to the creation of higher complex ideas, could be observed by introspection. Rationalism divides the mind into two parts: the conscious mind and the unconscious mind. Rationalists believed that some of the mind's processes were hidden from introspection, and these philosophers tried to hypothesize what those processes were doing. The hidden processes must be responsible for the kinds of certain and necessary knowledge that experience could never provide. Kant attempted to combine empiricism and rationalism by holding that both incoming sensations and the mind's processes were hidden from introspection. His transcendental philosophy tried to determine what sorts of mental processes must be responsible for transforming the incoming sensations into our experiences of the world. James used introspection, and his philosophy defended empiricism and attacked rationalism.

The second method of psychology, invented in the first half of the 19th century, is experimental psychology, which requires the subject of the experiment to be able to perform introspection. Experimental psychology is also a combination of empiricism and rationalism. Experimental psychology tries to study the activities of the mind by controlling the sensations coming into a person's mind and comparing them with the results of the person's descriptions of what she experiences. The psychologist forms theories about the mind's hidden processes and then tests those theories by trying to predict what the subject will report in the experiment. Experimental psychology has a similar standpoint to Kant, because the psychologist assumes that both the incoming sensations and the mental processes that transform into experience are hidden from the subject. For example, if a red point of light is projected onto a screen in front of the subject, and the red light is turned on and off very rapidly, the subject will describe that she sees a steady unblinking light. The actual sensations caused by the quickly blinking light exist at the retina of the eye. But the information about the light is transformed during its travel

through the nervous system to the higher brain. This transformation by hidden mental processes causes the subject to experience only a steady, unblinking light. James used experimental psychology and he was sympathetic to the idea that the nervous system selectively transformed the stimuli from the senses to create our perceptual experience of the world. James was persuaded that voluntarism was correct and he believed that the human mind was also a creative transformer of perceptions into higher and more complex ideas.

The third method of psychology, invented in the middle of the 19th century, was called "physiological psychology." The psychologist could examine the bodily structure of the nervous system and take it apart to observe its connections. James was impressed by many discoveries. The brain's neurons do not store memories, because only the connections between neurons are changed by experience. Also, there is no part of the brain that appears to be centrally controlling all of the other brain activities. One of the most surprising discoveries was that the reactions of the nervous system require time to happen. This should not be surprising, since the nervous system works by sending electrical charges through the long connections of thousands of nerve cells. Physicists already understood that light and electricity require time for travel. Electricity is very fast when it travels through a metal such as copper. Electricity travels much slower through living nerve cells. A connection from your finger to your brain can require as long as a half-second to happen. Nevertheless, this discovery that nerve cells require time to communicate their electrical signals implies that all thinking requires time. Since a brain is made of nerve cells, and thought happens because the nerve cells communicate through electrical signals, all thinking consists of processes over time. James was very impressed by this discovery and he was convinced that the duration of time was essential to all mental processes, experiences, and thoughts.

Dualistic philosophers were not pleased by these discoveries, because they did not believe that the mind had anything in common with nature. James was not ready to agree that mental processes were identical with physical processes, but James did not agree with dualists either. In his first book, *The Principles of Psychology* (1890), James did not try to solve the metaphysical question of whether materialism or idealism was correct. James adopted the popular compromise called psycho-physical parallelism. Psycho-physical parallelism is a dualistic philosophy that says that if any mental process is happening in a person's mind then there must also be a parallel physical process also happening in that person's brain at the same time.

James was neither a materialist nor an epiphenomenalist, and he tried to defend the existence of free-will. Some materialistic philosophers claimed that the mental process is identical to its parallel physical process. This identity, if real, would mean that if all physical processes are predetermined to happen by exact natural laws then all mental processes are also predetermined, and

therefore free will does not exist. Epiphenomenalist philosophers instead claimed that the mental process is not identical to its parallel physical process, and that the mental process is caused by the physical process. Epiphenomenalism claims that nothing that happens in the mind could ever cause anything to happen in the physical processes of the brain. Instead, the physical processes cause the mental processes. This philosophy denies the existence of free will, since no mental idea or desire or wish could ever be responsible for anything that the nervous system does. When I reach for the cup of water, the processes of my nervous system are responsible for two things: my arm muscles moving my hand towards the cup, and my experience of feeling my hand reaching for the cup. But nothing in my mind causes my hand to reach for the cup. My mind is only a useless by-product of my brain that can never really control anything I do.

James argued for the existence of free will in many of his writings. In an early essay, the 1884 "The Dilemma of Determinism," James explains that if humans really do not have any free will, then morality cannot exist. Morality exists only if people are personally responsible for their behavior. If people do not really have free will, they could not freely choose what to do. If a person cannot freely choose what to do, that person could not be personally responsible for what is done. Also, morality exists because people sometimes regret what they did wrong. But a person does not feel regret for doing something that she could not prevent. If no one has free will, then no one could prevent what they do. If free will does not exist, no one should ever feel regret for what they do, and therefore morality would not exist.

James argued for the existence of free-will in the *Principles of Psychology* by explaining that we can introspect into our experience and notice that we do feel our control over our bodies. We feel that we are in control and that we decide what we will do. But feeling our control does not prove that we really are in control, because our feeling could give us only the illusion of being in control. James then asks the question of why we do have such feelings of decision and control. James and materialists and epiphenomenalists believed that the theory of evolution is correct. According to the theory of evolution, our abilities have evolved into existence only because they are useful for human survival. Why did our mental experiences of decision and control evolved into existence? The answer is that our mental control must actually exist so that it can be useful for human survival. Human consciousness and all our feelings, including our feeling of being in control of our actions, must actually cause our behavior.

James concluded that human consciousness cannot be identified with any sort of physical material. Our thoughts are not really material things, and they are not caused by material things. This view has led many philosophers towards accepting dualism. James does not reject dualism in the *Principles of Psychology*, but he does reject dualism in his later writings about knowledge.

James was an empiricist, believing that all knowledge is based on experience. But James was not a dualistic empiricist because dualism is a kind of skepticism about knowledge. Also, dualistic empiricism conceives of mind and matter as substances having qualities. This Aristotelian perspective on the nature of reality was adopted unquestioningly by Descartes and most subsequent philosophers. James rejected the view that consciousness is any sort of physical material, and he rejected the view that consciousness is any sort of mental material. Consciousness, according to James, was not a substantial thing but instead a process or stream of only qualities.

James's rejection of the existence of the mind as a spiritual substance was a rejection of Descartes' theory of the mind and it was also a rejection of Christianity's idea of the "soul." Most philosophers and psychologists before James's time and also during James's life were Christians who believed in the existence of the soul, and they developed their philosophies of mind in harmony with Christian doctrines about the soul. The soul was needed to explain individual personality and why our experiences were always our own and not someone else's. The soul was also needed to explain human immortality and to explain how God passes moral judgment upon each of us on Judgment Day. James believed that philosophy and psychology should be more scientific by becoming free from religious conformity. James also believed that his new theory of consciousness which did not describe the mind as a substance could explain personal individuality.

Some philosophers, especially David Hume, also had rejected the idea that the mind was a substance having qualities. But when Hume described consciousness, he talked about impressions (what we would call perceptions) and ideas that had their own independent and self-sufficient reality. A substance, by definition, is not dependent on the existence of anything else. Hume replaced Descartes' picture of the mind as a whole substance that contained thoughts with his own picture of consciousness as a collection of substantive thoughts. Hume created the school of psychology called "associationism." Associationism claimed that mental processes were only comparisons of ideas to identify facts about the relations between ideas. Ideas were like the atoms pictured in 18th century materialism. Atoms could not merge, but they could be re-arranged into new complex shapes. Mental processes could re-arrange simple ideas and build more complex ideas, and mental processes could take apart complex ideas in order to identify the component simple ideas. According to associationism, ideas could never merge together or unify in a blending of their qualities.

James did not believe that ideas or thoughts were self-sufficient and independent of each other, because our consciousness does not appear to be a collection of independent perceptions and thoughts. Kant also believed that consciousness does not appear to us to be a collection of independent ideas, but Kant attempted to explain how consciousness appears to us by postulating

a hidden "transcendental ego" that pulls the hidden "sensations" together into coherently connected experience. James complains that if no substantial sensations really exist, then there is no need to postulate any transcendental ego. Psychology should simply study actual lived human experience and postulate hidden processes only if absolutely necessary. James's *Principles of Psychology* provides many studies of actual living human experience. He attacks associationism by giving examples of how consciousness cannot be made of independent parts. He attacks Kantian transcendentalism by showing how living human consciousness contains all of the relations and connections needed to explain the important features of human experience.

Experience cannot be a series of disconnected ideas following each other through time. James agreed with Kant and other idealists that if experience was only a chain of ideas, then we would never have any sense of personal identity through time. Every idea would completely occupy the attention, and then the next would completely occupy the attention, and the first idea would be completely forgotten. And then a third idea would come along to erase the second idea. The ability to remember ideas does not help to give us personal identity, because a remembered idea would simply be a fourth idea that completely erases the third idea. A person would never be able to understand that all of these ideas were his. Kantian idealism postulates that a hidden mental process links all these ideas together so that a person can understand that all of these ideas are his. James instead argues that consciousness contains the links, because some experiences are experiences of relations between other experiences. There is no need for a hidden mind to know its thoughts, because a thought could know other thoughts using the thoughts of relations.

James's examination of experience in *The Principles of Psychology* found the five basic features of any thought.

1. A thought is always a part of just one personal stream of consciousness. No thought can be part of two streams of consciousness, and no thought can exist separately from a stream of consciousness.

2. A thought exists only for a short time. A similar thought may reappear, but it cannot be the same thought twice. There is no place in the mind where thoughts are stored.

3. A thought always has a feeling of belonging with the other thoughts in the same stream of consciousness. A thought contains a feeling of being related and connected with other thoughts in its stream.

4. A thought always seems to be about something else that is independent of the thought. No thought is simply about itself. A thought is always

pointed at something that exists beyond the immediate stream of consciousness.

5. A thought can influence the next thoughts in the stream. Thoughts are attentively focused and selective. A thought always has the feeling of effort to control what sort of thought will follow it.

The requirement that every thought can belong to only one stream of consciousness is a claim that admits that dualism is correct. In his later writings, James eliminated this requirement, suggesting that some kinds of experiences can exist in two or more streams of consciousness at the same time.

Some philosophers used the results of experimental psychology to claim that all human experiences are basically composed of simple colors, sounds, and other sensations. This claim helped to support the philosophy of associationism. James did agree that experimental psychology should show how two or more simple sensations could combine to make a complex experience. For example, hearing three tones of sound at the same time can cause a person to hear a musical chord. But when a person hears a chord, that person cannot hear the three tones distinctly. Instead, the tones combine to make a new fourth kind of tone which is called the chord. Another example is lemonade, which can be made with lemon juice, sugar, and water. When a person tastes lemonade, the person does not taste water and sugar and lemon juice. The three ingredients blend together to produce a new fourth taste of lemonade. People do not experience the sensational parts of an experience because they only can experience the unified combination. James argues that the psychologist's ability to discriminate the sensational parts that cause a complex thought by using the methods of experimental psychology is not an ability of the person actually having the complex thought. A philosopher who claims that all thoughts are made of simple sensations commits a logical fallacy that James calls "the psychologist's fallacy." Experience is always of unified wholes, not parts. Hume's argument that we cannot experience the relations between ideas commits the psychologist's fallacy.

Experience is also actively goal-directed. Our thoughts are aimed at controlling our behavior, and so all thoughts are directly or indirectly involved in deciding how to act. Human experience is not only a process, but it is also creative. The ability of thoughts to control actions, and the ability of thoughts to incorporate aspects of previous thoughts without being completely predetermined by them, provides human beings with free will. James's psychology supports his pragmatism. Even though James did not announce that he was a pragmatist with his friend Charles Peirce until 1898, the *Principles of Psychology* clearly states that thoughts must serve the activities of the human being.

Pragmatic Empiricism and the Will to Believe

Experience as a whole, according to James, is only partially unified. Because we do not have only one thought at a time, but many thoughts happening together, our thoughts can lead us towards many actions at the same time. We can control our actions, so that we can accomplish one action before trying to accomplish another, but this is an ability of self-control that must be learned. Children do not have much control of their thoughts, causing them to be unable to complete complex tasks. Adults sometimes have difficulty organizing their thoughts so that organized actions happen in the correct way. James's theory of the stream of consciousness can explain why we have conflicting thoughts and competing motivations for different actions. Human rationality for James is essentially the struggle for practical control over these diverse and divergent currents in thought.

James is a voluntarist and therefore does not agree that evidence is simply all of the perceptions that are passively received by the sense from the natural world. Evidence for a hypothesis must be relevant to the hypothesis, which means that evidence must be selectively chosen from all of the objects and events in experience. Also, the evidence needed to support hypotheses must be created under experimentally controlled conditions. A hypothesis must predict what would happen under specified experimental conditions. Because evidence, both scientific and religious, must be predicted and selectively created, philosophers cannot claim that evidence has nothing to do with human activity. Human activity establishes evidence, and people would not try to establish evidence for a hypothesis unless they believed that the hypothesis might be true. Other philosophers have argued that a scientist must never believe a hypothesis at all until sufficient evidence is collected to support it. But James argues that this skeptical attitude would prevent many kinds of hypotheses from ever being tested and found to be correct. Both science and religion require that some small amount of belief is necessary so that truths can be learned by investigators. This is a shared foundation for both science and religion.

In "The Will to Believe" James uses the fact that the evidence confirming a hypothesis can only be created by some degree of belief to make his argument that religious beliefs should be tested by their consequences. People should be free to develop their religious beliefs and test them in their own lives. If people have the freedom to use religion to improve their own lives and the lives of others, then they have an opportunity to determine the truth of religion and to find greater happiness. If we instead follow those philosophers who demand sufficient evidence, we may avoid believing falsehoods, but we lose the opportunity to learn new truths and gain new happiness. While people cannot simply "decide" to confidently believe in a religious doctrine, people must start from some small commitment to the religion's possible truth. In return, the religious belief must make some differences to person's

lives. These differences will either support the religious commitment and make religious belief stronger, or these differences may cause a person to reject the religion completely. Fortunately, there are many kinds of religions that can be tested, so no one should be limited to trying only one religion.

It is very important for people to have the freedom to develop religious beliefs. James also argues in "The Will to Believe" that it is very important that people use this freedom to choose to become religious. James distinguishes between momentous and trivial options. Most choices we have are trivial because however we chose, the results of a trivial choice will never make any significant and permanent change to the value of our lives. A few choices are momentous because they are unique opportunities to make a permanent and important change to the value of our lives. Each person has the momentous opportunity to try to become religious; or, if a person is already religious then that person has the momentous opportunity to adopt a different religion. The choice between scientific hypotheses is never momentous, but the choice between becoming religious and remaining an atheist is always momentous. Some philosophers think that people should delay making any religious decision until sufficient evidence for God has been collected. These philosophers use the scientific method as their model for rationality, and according to the scientific method, it is rational to withhold belief in a hypothesis until sufficient evidence is gathered. But James argues that if we wait for scientific evidence for God, we will wait forever.

Scientific evidence is not relevant to the religious choice. Unlike the scientific method, which deals with only trivial choices, the religious method deals with momentous choices. If we do not decide to become religious, we are irrational, because we would lose a unique opportunity to improve the value of our lives. The nature of religious evidence must be very different from the nature of scientific evidence. James argues that for both science and religion, the origins of a hypothesis must be ignored when the hypothesis is tested by the evidence. Hypotheses may come in sleeping dreams or arrive in daydreams of imagination, but what matters to rationality is how hypotheses are empirically testable. Along with Charles Peirce, William James was one of the first philosophers to sharply distinguish what later 20th century philosophers have called "The Logic of Discovery" from "The Logic of Justification." Pragmatism is a transformed empiricism which focuses on the logic of justification. The accumulation of past experience causes inquirers to postulate hypotheses, but what justifies acceptance of an hypothesis is its ability to correctly predict future experiences.

Radical Empiricism, Pragmatism, and the Meaning of Truth

In *The Principles of Psychology* and in his writings on belief and religion from 1890 to 1903, James developed a pragmatic philosophy that was closely

related to his theory of the stream of consciousness. After 1903 James explicitly separated these two theories. The most important writings are "Does 'Consciousness' Exist?" and "A World of Pure Experience," both published in 1904. He declared that his theory of experience, which he called "radical empiricism," does not depend on the truth of pragmatism. James understood that there could be many kinds of pragmatism, including the pragmatisms developed by his friends Peirce, John Dewey, and F. C. S. Schiller. James did develop his own kind of pragmatism which continued to be closely related and dependent on his radical empiricism. James understood that there is a problem for his pragmatism, because pragmatism could be interpreted to be saying that each person has his own truth, because each person has only his own experience. The idea that each person has his own truth is called "subjectivism." Personal idealism also suffers from this problem of subjectivism. James wanted to treat truth as objective, because truth is about the relationship between a mental idea and something independently existing beyond the mental idea.

Dualism solves this problem by proposing a physical world beyond experience, but James rejected dualism. A dualistic theory of knowledge claims that true mental ideas are those which accurately represent the real features of physical reality. Dualism leads towards skepticism because dualism cannot identify which of our ideas are accurate representations. Dualism proposes that when a person knows that she sees the moon, she only sees a mental copy of the moon. No one can directly see a physical object, if dualism is correct, because everything that we see is only an idea in our own mind. However, when we see an object, we do not notice any ideas and we believe that we see only the physical object.

Absolute idealism, such as the philosophy of James's friend and Harvard colleague Josiah Royce, proposed to solve the subjectivism problem by describing everything real as mental and all human experience as a dependent part of the absolute (God) mind. The existence of God guarantees the objectivity of truth. James rejected absolute idealism because the dependence of human experience on God reduces human freedom and moral responsibility. Royce's absolute idealism is a kind of theism, and James could not accept any theism. Although there are many pragmatic themes in Royce's understanding of the human mind, his absolute idealism argues that there must be a transcendental self which guarantees the existence of one independent and objective world that is the same for all people.

All three philosophies, personal idealism, dualism, and absolute idealism, assume that consciousness is a particular kind of thing and that knowledge is a relation between consciousness and some other kind of thing. James instead believes that when the object is perceived, there is no relation between two things because the knower and the known are the same experience. James refers to perception as "knowledge by acquaintance" and states that

this kind of knowledge does not happen because something in consciousness has correctly represented something that is not in consciousness. Knowledge by acquaintance happens because the thing perceived is a part of the stream of consciousness. In "Does 'Consciousness' Exist" James claims that if "consciousness" refers to a substantial mind that contains representations of objects, this kind of consciousness does not exist. The only kind of consciousness is the stream of consciousness which contains perceived objects. James emphasizes the fact that experience is not contained within a substantial mind by stating that all experience is "pure" experience because it is essentially neither mental or physical. There is no need for a substantial mind to hold together the experiences because experiences are connected by relations within experience itself.

James's philosophy of radical empiricism claims that all of reality is made of various kinds of experience. This philosophy is pluralistic, because James does not claim that reality is made of one single kind of material called "experience" that can have many forms and varieties. Instead, James claims that an uncountable number of very different kinds of things exist, and they all have only one thing in common: they can be part of a stream of consciousness.

Critics of radical empiricism complained that James was designing a kind of solipsism. If philosophy can only debate experience, and if the only experience that anyone has is the experience within one's own stream of consciousness, then the world can only consist of the contents of that stream of consciousness. Is there really any world beyond one's own stream of consciousness? Critics wanted James to answer this question: does a perceived object continue to exist after a person has turned his vision in a different direction and when it is no longer any person's stream of experience? Personal idealism's answer is negative. Dualism's answer is negative, if by "perceived object" one means the idea of the object, while if "perceived object" means the physical object, then the answer is instead affirmative. Absolute idealism's answer is affirmative, since the perceived object would still be perceived by God. James wanted to answer this question affirmatively. But he also wanted to argue that when a person perceives an object, the object itself is perceived and not merely a mental copy of the object. He also wanted to believe that it is possible for two people to perceive the same object at the same time.

The only way to satisfy all of these affirmative answers is to declare that it is possible for a perceived object to join one or more streams of experience without becoming dependent on any of those streams of experience for its existence. The relations between a perceived object and the rest of a stream of experience are within the stream of experience, so that the relationship itself is experienced. But the relation between a perceived object and a stream of experience is not a necessary relation but instead a contingent relation. The perceived object does not always have to be a part of a stream of experience,

but it is possible for it to occasionally join a stream of experience. Furthermore, we can only conceive of the perceived object as experienceable, because we do not know how to conceive of the object in any other way. If we remove from our conception of an object all of its features that it has in experience, there would be nothing left of the object to think about. Therefore, we must conceive the object as continuing to be a set of related experiences even when it is not part of any other stream of experience.

This statement of the contingent relationship between the perceived object and a stream of consciousness is the conclusion of his radical empiricism. It permits James to redefine the meanings of "mental" and "physical" by using revised ideas of the "objective" and "subjective." The physical object is a pattern of experiences considered as having its own existence independent of its relations with my own stream of consciousness, even though these two series of experiences can merge during my perception of the physical object. During the merging of perception, I can call the object mental also if I consider how the object is a part of my stream of consciousness. An experience can be both physical and mental at the same time, depending on which set of the experience's relations are selected for consideration. Dualists believe that a perception always has two parts: the experience of the object, and the object that is perceived. James denies that experience has such an "inner duplicity."

In perception, or what James calls "knowledge by acquaintance," the object perceived is identical with the perception of the object. If we ignore the perception's relations with other surrounding experiences, we have only "pure" experience. Usually we do not ignore the surrounding relations and we classify experiences as mental and physical automatically. Philosophers can use introspection to understand how to reveal and question our assumptions about ourselves and the world.

The philosophy of radical empiricism is compatible with, and supports, James's version of pragmatism. Two basic principles were used to construct James's pragmatism. First, a thought or idea always leads towards some further and future thoughts in experience. Thoughts are not passive and disconnected from each other. Thoughts are active and creative, because they stimulate additional experiences which grow from them. Second, thoughts are meaningful only because they are always about some other experience and can help bring about that other experience by motivating us to act. James recognizes that many thoughts never directly result in any active exploration of the world. Some thoughts are merely imaginative speculations that no one would claim are true. These speculations are pragmatically meaningless because they have nothing to do with human action. Meaningful thoughts do produce experiences through human activity.

When we have an opportunity to learn from other people and compare our thoughts about the world, we can together experiment with thoughts to see

whether they do produce their intended consequences. His theory of truth, explained in the next section, explains how we can evaluate ideas by testing their intended consequences. Ideas can only be evaluated for truth if they do have practical consequences, and two different ideas can be compared if their practical consequences are different. James agrees with Peirce that the pragmatic method of evaluating ideas by their practical consequences is the essence of the scientific method.

James sometimes describes his approach to truth as a much-needed clarification of the classical "correspondence" theory of truth. The correspondence theory of truth has two meanings, an ordinary meaning and a philosophical meaning. In ordinary language, a person knows the truth when that person can describe an event exactly as it really happened. If a person has "knowledge by acquaintance" with an event, then that person could know the truth. A person does not know the truth if he cannot describe an event exactly as it really happened. Many events take place even though no one observed them. If an unobserved event takes place, there is no truth to be told about that event because no one can describe exactly what happened. We might guess what actually happened later, and some people are very good at determining what probably happened (such as police detectives). But unless someone could prove that he actually witnessed the event, such as a crime, no one could have the truth. James's theory of truth is designed to agree with this ordinary understanding of "truth." James speaks of a person's meaningful idea as capable of "leading" one towards its object. A witness in possession of some true ideas about the witnessed event ought to be able to return to the scene of the crime and recognize its main features.

The correspondence theory of truth according to philosophers is more complex. According to the philosophical theory of truth, any event, whether it is actually observed or not, could be known as a truth. Suppose the unobserved event is a tree falling down after being struck by lightning. If I observe the lightning bolt from a mile away, I can see that the lightning bolt has struck somewhere in a forest. But I am too far away to see individual trees and I did not see any tree fall down. Now suppose I then think the thought, "A tree fell down after being hit by that lightning bolt." According to the ordinary meaning of "truth," I do not know a truth about any tree. I have only made a guess. But a tree really did fall down. According to the philosophical theory of truth, my thought is a truth. My thought is a truth because it does state the real events. My thought is "A tree fell down after being hit by that lightning bolt," and the actual event in the forest a mile away was a tree falling down after being hit by that lightning bolt. There is a correspondence between my thought and the actual event far away, and that is enough to make my thought true.

According to the ordinary meaning of truth, I cannot have a true thought if I cannot prove that my thought is actually correct. But according to the

philosophical correspondence theory of truth, my thought is true regardless of whether I ever do prove it to be correct. If I never walk out into the forest, never find a fallen tree, and never observe the fire burns on the tree, I still have a true thought. James rejects this philosophical theory of correspondence. According to James's pragmatic theory of truth, I cannot have a true belief unless I could successfully prove my belief to be correct. Only that verifying capacity establishes any connection of reference between an idea and its object. For the philosophical correspondence theory of truth, somehow a person's idea could "really" successfully refer to some external object, even if the person had no understanding that this object exists, and had no grasp that his idea was referring to it. James, like other pragmatists, found this notion of reference completely mysterious and contrary to a scientific understanding of the mind.

The modern philosophical theory of correspondence was developed primarily by metaphysical dualists who believed that all of our ideas were inside our minds. Since we could never compare our ideas with the physical world, because the physical world could never be experienced in any way, metaphysical dualists decided that truth did not require proof in actual experience. According to dualism, if an idea does copy reality, then that idea is true, and it does not matter if I can never prove that my idea actually does copy reality. Metaphysical dualism always leads towards skepticism, because skepticism is the view that we can never discover whether any of our ideas are true knowledge. James's pragmatism is designed to prevent skepticism, which is a familiar task for empiricisms.

Another problem for the philosophical correspondence theory of truth was that modern science no longer attempts to establish "pictures" of the world. Simple pictures of objects in perception can be captured and remembered by images in the imagination, which Locke and Hume called "ideas." But complex scientific theories do not try to form copying images of the world. Modern science attempts to discover the laws of natural processes, like gravity. Natural processes are not "facts" that can be stated as relations between observed qualities. We cannot see most natural processes, and we do not know how to picture them. There are so many natural processes, and so many different ways to describe their operations, that there can no longer be any expectation that we will soon make our theories consistent with each other and perfectly true. The criteria for knowledge of natural processes must be something other than correspondence. James offered the criteria of "satisfactory working." The true idea is what satisfactorily works. Since there are varying degrees of working, there can be many degrees of truth. There are also many different kinds of working, depending on the sort of idea or theory involved. All satisfactory workings of ideas requires some sort of active human experience.

James, unlike Peirce, does not have a sophisticated philosophy of science to offer. His examples in his writings which illustrate his definition of truth are typically simple examples of ordinary life and not laboratory experi-

ments. The advantage of using James's definition of truth, however general, is that it covers both ordinary life and laboratory experiments. Because pragmatically meaningful ideas, thoughts, and theories must lead towards some practical consequences, the testing of their truth is just the testing of their value for actually leading towards their intended goals.

Knowledge by acquaintance is the most fundamental kind of knowledge, but it is also, by itself, not very useful. People cannot always be focused on the immediate present. In order to achieve our future goals we must have ideas which suggest how to get from where we are now to where we want to be. These ideas must instruct us how to perform a series of actions which will result in a practical experience. These ideas attempt to represent the final stage of the process where the practical consequences are.

James describes this second kind of knowledge as knowledge by representation. Representational knowledge requires that an idea directs the stream of consciousness through a series of connected experiences of the natural world that arrive at a perception (a knowing by acquaintance) of the intended thing. If all knowledge were knowledge by acquaintance, then the problem of solipsism could arise. But our ability to have knowledge by representation requires that a natural world of experienceable things must always surround us. James constantly stated that a thought must point beyond itself to something that exists independently of it. He also points out that early in life babies discover that objects continue to exist even while they are not observed. For the rest of our lives, we believe that "reality" is what is permanent and not within our control while our perceptions are changing under our control.

James sometimes called his theory of truth an "epistemological dualism." Epistemological dualism states that an idea is true only because it is about some other independent existence. All metaphysical dualists are also epistemological dualists, but some epistemological dualists could instead be empiricists, such as James. When we have knowledge by acquaintance, we have something in our experience which does not depend on that experience for its existence. When we have knowledge by representation, we are led towards something that exists independently of our experience even though it can come into experience. The metaphysical dualist claims that we can never experience nature. James claims that we can experience nature, and that is the only way for us to ever have any knowledge and truth.

Many critics attacked James's theory of truth by accusing his theory of declaring that the truth is only whatever anyone wants to believe. These critics instead say that that the truth does not depend on what we believe. This accusation is false, because when we test some idea that we want to believe, the test may not succeed and then we must admit that the belief is false. James does say that a true idea is one which is believed and survives testing.

Other critics attacked James's theory of truth by accusing his theory of declaring that truth is only what each individual person believes is true.

These critics instead say that the truth is what all people must together believe is true. This accusation is false, because most of our beliefs are shared by others. We should test our shared beliefs together, and agree that the true beliefs are those which successfully work as intended. James does say that some true ideas are only believed by single individuals. Each person has many beliefs that other people do not care about at all.

Some philosophers have attacked James's theory of truth because it would not allow truths about things too small to be observed or things completely hidden from observation, such as forces of nature. James does not say that theories about hidden things are meaningless. Theories must have practical consequences for human experience. A theoretical model of the parts of an atom can never lead a scientist through nature towards an individual atom so that she can have a knowing by acquaintance of an electron. However, the model of the atom can lead a scientist to a design of an experiment to test whether the observable effects of electrons actually do happen as predicted by the theory. A pragmatically meaningful theory must make predictions about what would be observed.

Many of the philosophers who criticized James's theory of truth did not believe that James really had a theory of truth because truth must be absolute. These philosophers declared that if a belief could possibly be revised by future discoveries, then it could not be true. A truth must be absolutely true, which means that it could never be revised. Peirce did define truth in this way, and was concerned by James's use of the word truth is a different sense. James did agree with Peirce that an absolutely true belief is a belief which could never be revised by further investigation and experiment. James also wanted to talk about kinds of truths which were less than perfect. Nearly all of human knowledge is less than perfect. Our knowledge is not completely false, either. James's epistemological position, like that of all pragmatists, is instead fallibilism. Knowledge is always potentially revisable. While knowledge settles doubt, reaching a resolution of doubt is not the same psychological state as achieving an enduring certainty. Pragmatism has no place in its epistemology for permanent a priori certainties. We should understand that there are degrees of knowledge and truth, and that any knowledge we now possess could fail to work in the future.

The pragmatic theory of truth portrays knowledge as relative to a context of purposes. For example, a surveyor of land knows how to measure the dimensions of a section of land and determine how much area is enclosed by the property lines of that piece of land. Surveying knowledge allows people to make very accurate maps of neighborhoods and towns and cities. However, surveying knowledge only works for small areas of land, because the methods of surveying assume that the land is mostly flat. The mathematics used by surveying is Euclidean geometry, which works only for flat areas of space. If a map-maker wants to measure the land area of an entire country, he cannot

use only surveying knowledge. Because the earth is a sphere, the land does not obey Euclidean geometry but instead spherical geometry. There is a different kind of knowledge of mapping large areas of land. Today we can use satellite surveying. Surveying knowledge is not shown to be false because it cannot be used to accurately measure large areas of land. Surveying knowledge does not attempt to make large measurements, and satellite surveying does not attempt to make small measurements. Both methods of knowledge are true for their own separate purposes because they work for their separate purposes.

James's theory of truth does portray human knowledge as very selective because we only test those beliefs that are needed for human activities. The description of the scientist as completely impartial, neutral and lacking desires is quite inaccurate. It is true that scientists should not corrupt experiments in order to guarantee that the predicted results will happen. However, James explains that scientific theories are created only because people have practical problems to be solved. Scientific knowledge develops only in those directions which are viewed as important by scientists. Sometimes scientists ignore an area of possible research because they have no interests in that field. In America, it has been discovered that many drugs have been developed for typically male health problems, while fewer drugs have been developed for health problems suffered only by women. The best explanation is that until recently most medicine scientists have been men. If a society wants its scientists to explore a new area of research, it should control the funding of scientific research in that direction. James understood that science should be supervised by a society trying to promote equality and justice.

Personalism, Pluralism, and Panpsychism

Throughout his career, William James defended a personalistic philosophy. Personalism is a name for a philosophy which tries to understand all reality primarily through concepts significant in personal experience. Personalism is opposed to other impersonalist philosophies which try to conceive of reality using only abstract concepts that are not part of personal experience. Some impersonalisms are "logicist" philosophies that use pure logic or mathematics to define reality. Other impersonalisms are "materialist" philosophies that only use abstract scientific terms, such as energy or mass, to define what reality is. James's personalism rejects logicism and materialism. His doctrine of radical empiricism demands that reality be conceived in terms of only the contents of human experience. Personalism does not require the belief that nothing beyond human experience exists. James says that if it is pragmatically necessary to believe in realities beyond human experience (and James does believe that some of these entities, such as God, are pragmatically useful), then philosophy should conceive of these entities only using concepts taken from actual human experience. A major task of any personalistic

philosophy is to explain how philosophy should conceive of physical objects.

In his writings from 1904 to 1905, James attempted to explain the difference between physical and mental objects by postulating his principle of "pure experience." All things in experience are neither essentially physical nor mental, because they are "pure" experience when they are considered by themselves. While all real things are pure experience, real things can at one time function as mental things and at other times they can function as physical things. A "physical" object must have two abilities. It has the ability to join in relations with the other ideas of a stream of consciousness. It also has the ability to continue to exist as experience even while it is not a part of any person's stream of consciousness. James declares that such physical objects really exist. A "mental" object can only exist while it is part of a stream of consciousness. The principle of radical empiricism states that thoughts have only contingent relations to other thoughts. Therefore, there is no thought which must always belong to a stream of consciousness. There are no thoughts which must always be mental. We can distinguish between physical and mental experiences only by observing the series of contingent relations that experiences have with other experiences.

If I stand in the center of a room that has a picture hanging on each wall and slowly turn around so that I see each wall in succession, everything that I see is an experience. All four pictures will be in my stream of consciousness. If I consider only the relations that the four pictures have with each other as following each other in my stream of experience, then the pictures are mental. I can say, "I saw the first picture, then the second picture, then the third picture, and then the fourth picture." If I consider only the relations that one of pictures has with the other objects in the room, then that picture is physical. I can say, "The picture was hanging on the east wall of the room for the entire time that I was looking around at the walls, and for a brief time the picture was also in my experience." The brief experience of the picture is a pure experience because by itself, it is neither mental nor physical. Its nature is defined by the sequence of events in which it participates. In my example, it participated in two different sequences of events at the same time, and these sequences briefly merged at the moment that I was looking at the picture.

James was not satisfied with this principle of pure experience. From 1906 to his death in 1910, James's doctrine of radical empiricism sometimes supported a different view called panpsychism. The primary reasons for dissatisfaction with the theory of pure experience are (1) what is the nature of the physical object while it is not being experienced, and (2) how can two people experience the same object at the same time? The first question must be answered by radical empiricism by saying that the object is not a physical object, and it is not a mental object either, when it is not in any stream of experience. But the object must still be an experience, since everything must be conceived as an experience according to James. But who experiences the

object? James was often tempted to say that the object can experience itself. James did argue in his *Principles of Psychology* and later writings that there is no need to postulate a mind that knows its own experiences, because each experience in the stream of thought simply experiences itself all by itself. Therefore, if our own experiences can be experiences for themselves, then any object can be an experience for itself. James was willing, in his later writings, to suggest the philosophy of panpsychism: that all existing things are experiences for themselves as well as possible experiences for others.

James was also attracted to panpsychism because it could solve his problem of explaining how two people could experience the same object at the same time. His doctrine of the stream of consciousness, as presented in his *Psychology*, emphasized that a thought had to be a completely unified thing without parts or internal relations. A thought could have external relations with other thoughts, and it is possible for an experience to be externally related to two different streams of consciousness. But no thought could have "perspectives" that present one quality when observed from one direction, and from another perspective appear to have a different quality. Let this doctrine be called the "unique quality" doctrine. Between 1904 and 1908 James realized that an experience, if conceived according to this "unique quality" doctrine, could not be the same for two different people. Suppose than an object O is experienced by a stream of consciousness for person A, and O is also experienced by a stream of consciousness for person B. If O is in A's stream of consciousness, than means that the experience of O must be O in its relation to the next thoughts in A's stream. The same is true for B. If O is in B's stream of consciousness, than means that the experience of O must be O in its relation to the next thoughts in B's stream. The object O must have two different qualities: its relations to A's stream, and its relations to B's stream. However, according to the "unique quality" doctrine of thoughts presented in his *Psychology*, no object in experience can have two different qualities depending on its relations to other things.

James realized that the "unique quality" doctrine was a false doctrine because it requires that an object be conceived as static, unchanging, and timeless. It is true that you cannot look at an object and see two of its perspectives at the same time. If you are standing in front of a building, you cannot see both the front of the building and the back of the building at the same time. But we know that a building has both a front and a back side. Perhaps thoughts and experiences have perspectives too. James rejected associationism because it portrayed thoughts as unchanging, unrelated, and made of simple parts. James corrected associationism when he declared that thoughts can be related by other thoughts, but he argued that thoughts must have a unique and static quality.

By 1907 James realized that this was a mistake. He realized that only "intellectualist logic" requires that any object that can be identified must have

a unique and static quality. When James had attempted to identify individual thoughts in the *Psychology*, he used intellectualist logic to specify particular thoughts. That is why he described the stream of consciousness as a chain of a series of consecutive thoughts. The only difference between his view and associationism is that James found that some of the thoughts in the stream were relations, while associationism declared that it was impossible to experience relations. By 1907 James was ready to stop using intellectualist logic to describe consciousness. Instead of requiring that each thought be a separate, static existence, James described thoughts as having overlapping and merging parts. Only after 1907 did James portray consciousness as a genuine stream of flowing and merging thoughts. While the intellectual discrimination of specific thoughts can be made, James argued that this discrimination does not accurately capture the actual flow of lived experience. When we use concepts to identify thoughts as this specific thought or that other specific thought, we are breaking up and stopping the stream of thought to create something that was not really there in pure experience.

If consciousness is truly a stream, then any part of the stream is always merged with any next part. We might notice the waves of the stream, but the waves have no fixed unchanging boundaries and are always connected to other waves near them. Experiences are just like waves of water in the stream, and all experiences are continually merging with other experiences.

This new conception of experiences as always changing and having merged parts with other experiences solves James's problem of explaining how one object can be observed by two different people at the same time. The object must be a complex experience for itself, capable of merging with multiple streams of consciousness at the same time. Any real thing must be an object of experience that could merge with other experiences, including the experiences of people. James did not explain thoroughly this theory of panpsychism, although later philosophers such as Alfred North Whitehead built upon James's writings.

James did clearly explain his view of metaphysical pluralism in two later books, *A Pluralistic Universe* and *Some Problems of Philosophy*. The philosophy of monism, which includes absolute idealism, declares that all things are fundamentally one sort of thing and that all things must be connected in some way. James explains that monism can be defended only by an intellectualist logic. If it is said that two different things are related to each other in some way, then the relation between them is always conceived statically as some third thing. How can A be related to C through the relation of B? A must be somehow related to B first. But if A is related to B, then there must be the relation D, and so on. An infinite number of relations are required, which is absurd. Therefore, the original supposition that A is related to B must be false, and therefore A and B cannot really be two separate things. In *Some Problems of Philosophy* James protests against monism on four

grounds: monism cannot explain why we each experience only our own finite minds, monism supports theism and all of theism's problems, monism contradicts the way that we actually do experience the world, and monism supports determinism and a denial that free will exists. Pluralism declares that the universe is not fundamentally one thing but is instead a plurality of an infinite number of different kinds of things that can interact and merge and separate again.

Pluralism states that the relations between existing things are contingent and temporary. Pluralism also is compatible with the doctrine of tychism, which James learned from Peirce. According to James's tychistic pluralism, new existences can spontaneously come into existence without being caused to exist by any prior existence. This tychistic pluralism permits the existence of free will and can accurately describe the way that we experience our own minds and the world around us. Tychistic pluralism resolves the problem of evil by explaining that evil really does exist, but goodness might defeat evil through human efforts. Tychistic pluralism is therefore used by James to support his moral philosophy of meliorism.

Furthermore, when tychistic pluralism was combined by James with panpsychism in his last writings, James found a way to support his religious views. James believed that it is possible for the spirit of God to merge with human minds. James argued that if his pluralistic panpsychism is correct, this merger with God is possible. In both *A Pluralistic Universe* and *Some Problems of Philosophy* James offered a metaphysical vision of human consciousness as an organic part of the much larger consciousness of God. James sometimes referred to reality as an "unfinished universe" of open possibilities. James's philosophy is the philosophy of adventure with the unknown, struggle with evil, and possible rewards for a person's loyalty to ideals.

Writings by William James

REMARKS ON SPENCER'S DEFINITION OF MIND AS CORRESPONDENCE

William James, "Remarks on Spencer's Definition of Mind as Correspondence." *Journal of Speculative Philosophy* 12.1 (January 1878): 1–18.

As a rule it may be said that, at a time when readers are so overwhelmed with work as they are at the present day, all purely critical and destructive writing ought to be reprobated. The half-gods generally refuse to go, in spite of the ablest criticism, until the gods actually *have* arrived; but then, too, criticism is hardly needed. But there are cases in which every rule may be broken. "What!" exclaimed Voltaire, when accused of offering no substitute for the Christianity he attacked, "*je vous délivre d'une bête féroce, et vous me demandez par quoi je la remplace*!" Without comparing Mr. Spencer's definition of Mind either to Christianity or to a "*bête féroce*," it may certainly be said to be very far-reaching in its consequences, and, according to certain standards, noxious; whilst probably a large proportion of those hard-headed readers who subscribe to the *Popular Science Monthly* and *Nature*, and whose sole philosopher Mr. Spencer is, are fascinated by it without being in the least aware what its consequences are.

The defects of the formula are so glaring that I am surprised it should not long ago have been critically overhauled. The reader will readily recollect what it is. In part III of his *Principles of Psychology*, Mr. Spencer, starting from the supposition that the most essential truth concerning mental evolution will be that which allies it to the evolution nearest akin to it, namely, that of Life, finds that the formula "*adjustment of inner to outer relations*," which was the definition of life, comprehends also "the entire process of mental evolution." In a series of chapters of great apparent thoroughness and minuteness he shows how all the different grades of mental perfection are expressed by the degree of extension of this adjustment, or, as he here calls it, "correspondence," in space, time, speciality, generality, and integration. The polyp's tentacles contract only to immediately present stimuli, and to almost all alike. The mammal will store up food for a day, or even for a season; the bird will start on its migration for a goal hundreds of miles away; the savage will sharpen his arrows to hunt next year's game; while the astronomer will proceed, equipped with all his instruments, to a point thousands of miles

distant, there to watch, at a fixed day, hour, and minute, a transit of Venus or an eclipse of the Sun.

The picture drawn is so vast and simple, it includes such a multitude of details in its monotonous frame-work, that it is no wonder that readers of a passive turn of mind are, usually, more impressed by it than by any portion of the book. But on the slightest scrutiny its solidity begins to disappear. In the first place, one asks, what right has one, in a formula embracing professedly the "entire process of mental evolution," to mention only phenomena of cognition, and to omit all sentiments, all esthetic impulses, all religious emotions and personal affections? The ascertainment of outward fact constitutes only one species of mental activity. The genus contains, in addition to purely cognitive judgments, or judgments of the actual – judgments that things do, as a matter of fact, exist so or so – an immense number of emotional judgments: judgments of the ideal, judgments that things *should* exist thus and not so. How much of our mental life is occupied with this matter of a better or a worse? How much of it involves preferences or repugnances on our part? We cannot laugh at a joke, we cannot go to one theater rather than another, take more trouble for the sake of our own child than our neighbor's; we cannot long for vacation, show our best manners to a foreigner, or pay our pew rent, without involving in the premises of our action some element which has nothing whatever to do with simply cognizing the actual, but which, out of alternative possible actuals, selects one and cognizes that as the ideal. In a word, "Mind," as we actually find it, contains all sorts of laws – those of logic, of fancy, of wit, of taste, decorum, beauty, morals, and so forth, as well as of perception of fact. Common sense estimates mental excellence by a combination of all these standards, and yet how few of them correspond to anything that actually *is* – they are laws of the Ideal, dictated by subjective *interests* pure and simple. Thus the greater part of Mind, quantitatively considered, refuses to have anything to do with Mr. Spencer's definition. It is quite true that these ideal judgments are treated by him with great ingenuity and felicity at the close of his work – indeed, his treatment of them there seems to me to be its most admirable portion. But they are there handled as separate items having no connection with that extension of the "correspondence" which is maintained elsewhere to be the all-sufficing law of mental growth.

Most readers would dislike to admit without coercion that a law was adequate which obliged them to erase from literature (if by literature were meant anything worthy of the title of "mental product") all works except treatises on natural science, history, and statistics. Let us examine the reason that Mr. Spencer appears to consider coercive.

It is this: That, since every process grows more and more complicated as it develops, more swarmed over by incidental and derivative conditions which disguise and adulterate its original simplicity, the only way to discover its true and essential form is to trace it back to its earliest beginning. There it will

appear in its genuine character pure and undefiled. Religious, esthetic, and ethical judgments, having grown up in the course of evolution, by means that we can very plausibly divine, of course may be stripped off from the main stem of intelligence and leave that undisturbed. With a similar intent Mr. Tylor says: "Whatever throws light on the origin of a conception throws light on its validity." Thus, then, there is no resource but to appeal to the polyp, or whatever shows us the form of evolution just *before* intelligence, and what that, and only what that, contains will be the root and heart of the matter.

But no sooner is the reason for the law thus enunciated than many objections occur to the reader. In the first place, the general principle seems to lead to absurd conclusions. If the embryologic line of appeal can alone teach us the genuine essences of things, if the polyp is to dictate our law of mind to us because he came first, where are we to stop? He must himself be treated in the same way. Back of him lay the not-yet-polyp, and, back of all, the universal mother, fire-mist. To seek there for the reality, of course would reduce all thinking to nonentity, and, although Mr. Spencer would probably not regard this conclusion as a *reductio ad absurdum* of his principle, since it would only be another path to his theory of the Unknowable, less systematic thinkers may hesitate. But, waiving for the moment the question of principle, let us admit that relatively to *our* thought, at any rate, the polyp's thought is pure and undefiled. Does the study of the polyp lead us distinctly to Mr. Spencer's formula of correspondence? To begin with, if that formula be meant to include disinterested scientific curiosity, or "correspondence" in the sense of cognition, with no ulterior selfish end, the polyp gives it no countenance whatever. He is as innocent of scientific as of moral and aesthetic enthusiasm; he is the most narrowly teleological of organisms; reacting, so far as he reacts at all, only for self-preservation.

This leads us to ask what Mr. Spencer exactly means by the word correspondence. Without explanation, the word is wholly indeterminate. Everything corresponds in some way with everything else that co-exists in the same world with it. But, as the formula of correspondence was originally derived from biology, we shall possibly find in our author's treatise on that science an exact definition of what he means by it. On seeking there, we find nowhere a definition, but numbers of synonyms. The inner relations are "adjusted," "conformed," "fitted," "related," to the outer. They must "meet" or "balance" them. There must be "concord" or "harmony" between them. Or, again, the organism must "counteract" the changes in the environment. But these words, too, are wholly indeterminate. The fox is most beautifully "adjusted" to the hounds and huntsmen who pursue him; the limestone "meets" molecule by molecule the acid which corrodes it; the man is exquisitely "conformed" to the *trichina* which invades him, or to the typhus poison which consumes him; and the forests "harmonize" incomparably with the fires that lay them low. Clearly, a further specification is required; and,

although Mr. Spencer shrinks strangely from enunciating this specification, he everywhere works his formula so as to imply it in the clearest manner.

Influence on physical well-being or survival is his implied criterion of the rank of mental action. The moth which flies into the candle, instead of away from it, "fails," in Spencer's words (vol. I, p. 409), to "correspond" with its environment; but clearly, in this sense, pure cognitive inference of the existence of heat after a perception of light would not suffice to constitute correspondence; while a moth which, on feeling the light, should merely vaguely fear to approach it, but have no proper image of the heat, would "correspond." So that the Spencerian formula, to mean anything definite at all, must, at least, be re-written as follows: "Right or intelligent mental action consists in the establishment, corresponding to outward relations, of such inward relations and reactions as will favor the survival of the thinker, or, at least, his physical well being."

Such a definition as this is precise, but at the same time it is frankly teleological. It explicitly postulates a distinction between mental action pure and simple, and *right* mental action; and, furthermore, it proposes, as criteria of this latter, certain ideal ends – those of physical prosperity or survival, which are pure *subjective interests* on the animal's part, brought with it upon the scene and corresponding to no relation already there.[1] No mental action is right or intelligent which fails to fit this standard. No correspondence can pass muster till it shows its subservience to these ends. Corresponding itself to no actual outward thing; referring merely to a future which *may* be, but which these interests now say *shall* be; purely ideal, in a word, they judge, dominate, determine all correspondences between the inner and the outer. Which is as much as to say that *mere* correspondence with the outer world is a notion on which it is wholly impossible to base a definition of mental action. Mr. Spencer's occult reason for leaving unexpressed the most important part of

[1] These interests are the real *a priori* element in cognition. By saying that their pleasures and pains have nothing to do with correspondence, I mean simply this: To a large number of terms in the environment there may be inward correlatives of a neutral sort as regards feeling. The "correspondence" is already there. But, now, suppose some to be accented with pleasure, others with pain; that is a fact additional to the correspondence, a fact with no outward correlative. But it immediately orders the correspondences in this way: that the pleasant or interesting items are singled out, dwelt upon, developed into their farther connections, whilst the unpleasant or insipid ones are ignored or suppressed. The future of the Mind's development is thus mapped out in advance by the way in which the lines of pleasure and pain run. The interests precede the outer relations noticed. Take the utter absence of response of a dog or a savage to the greater mass of environing relations. How can you alter it unless you previously *awaken an interest – i.e.*, produce a susceptibility to intellectual pleasure in certain modes of cognitive exercise? Interests, then, are an all-essential factor which no writer pretending to give an account of mental evolution has a right to neglect.

the definition he works with probably lies in its apparent implication of subjective spontaneity. The mind, according to his philosophy, should be pure product, absolute derivative from the non-mental. To make it dictate conditions, bring independent interests into the game which may determine what we shall call correspondence, and what not, might, at first sight, appear contrary to the notion of evolution which forbids the introduction at any point of an absolutely new factor. In what sense the existence of survival interest does postulate such a factor we shall hereafter see. I think myself that it is possible to express all its outward results in non-mental terms. But the unedifying look of the thing, its simulation of an independent mental teleology, seems to have frightened Mr. Spencer here, as elsewhere, away from a serious scrutiny of the facts. But let us be indulgent to his timidity, and assume that survival was all the while a "mental reservation" with him, only excluded from his formula by reason of the comforting sound it might have to Philistine ears.

We should then have, as the embodiment of the highest ideal perfection of mental development, a creature of superb cognitive endowments, from whose piercing perceptions no fact was too minute or too remote to escape; whose all-embracing foresight no contingency could find unprepared; whose invincible flexibility of resource no array of outward onslaught could overpower; but in whom all these gifts were swayed by the single passion of love of life, of survival at any price. This determination filling his whole energetic being, consciously realized, intensified by meditation, becomes a fixed idea, would use all the other faculties as its means, and, if they ever flagged, would by its imperious intensity spur them and hound them on to ever fresh exertions and achievements. There can be no doubt that, if such an incarnation of earthly prudence existed, a race of beings in whom this monotonously narrow passion for tribal self-preservation were aided by every cognitive gift, they would soon be kings of all the earth. All known human races would wither before their breath, and be as dust beneath their conquering feet.

But whether any Spencerian would hail with hearty joy their advent is another matter. Certainly Mr. Spencer would not; while the common sense of mankind would stand aghast at the thought of them. Why does common opinion abhor such a being? Why does it crave greater "richness" of nature in its mental ideal? Simply because, to common sense, survival is only one out of many interests – *primus inter pares*, perhaps, but still in the midst of peers. What are these interests? Most men would reply that they are all that makes survival worth securing. The social affections, all the various forms of play, the thrilling intimations of art, the delights of philosophic contemplation, the rest of religious emotion, the joy of moral self-approbation, the charm of fancy and of wit – some or all of these are absolutely required to make the notion of mere existence tolerable; and individuals who, by their special powers, satisfy these desires are protected by their fellows and enabled

to survive, though their mental constitution should in other respects be lamentably ill-"adjusted" to the outward world. The story-teller, the musician, the theologian, the actor, or even the mere charming fellow, have never lacked means of support, however helpless they might individually have been to conform with those outward relations which we know as the powers of nature. The reason is very plain. To the individual man, as a social being, the interests of his fellow are a part of his environment. If his powers correspond to the wants of this social environment, he may survive, even though he be ill-adapted to the natural or "outer" environment. But these wants are pure subjective ideals, with nothing outward to correspond to them. So that, as far as the individual is concerned, it becomes necessary to modify Spencer's survival formula still further, by introducing into the term environment a reference, not only to existent things, but also to ideal wants. It would have to run in some such way as this: "Excellence of the individual mind consists in the establishment of inner relations more and more extensively conformed to the outward facts of nature, and to the ideal wants of the individual's fellows, but all of such a character as will promote survival or physical prosperity."

But here, again, common sense will meet us with an objection. Mankind desiderate certain qualities in the individual which are incompatible with his chance of survival being a maximum. Why do we all so eulogize and love the heroic, recklessly generous, and disinterested type of character? These qualities certainly imperil the survival of their possessor. The reason is very plain. Even if headlong courage, pride, and martyr-spirit do ruin the individual, they benefit the community as a whole whenever they are displayed by one of its members against a competing tribe. "It is death to you, but fun for us." Our interest in having the hero as he is, plays indirectly into the hands of our survival, though not of his.

This explicit acknowledgment of the survival interests of the tribe, as accounting for many interests in the individual which seem at first sight either unrelated to survival or at war with it, seems, after all, to bring back unity and simplicity into the Spencerian formula. Why, the Spencerian may ask, may not all the luxuriant foliage of ideal interests – aesthetic, philosophic, theologic, and the rest – which co-exist along with that of survival, be present in the tribe and so form part of the individual's environment, merely by virtue of the fact that they minister in an indirect way to the survival of the tribe as a whole? The disinterested scientific appetite of cognition, the sacred philosophic love of consistency, the craving for luxury and beauty, the passion for amusement, may all find their proper significance as processes of mind, strictly so-called, in the incidental utilitarian discoveries which flow from the energy they set in motion. Conscience, thoroughness, purity, love of truth, susceptibility to discipline, eager delight in fresh impressions, al though none of them are traits of Intelligence *in se*, may thus be marks of a general mental

energy, without which victory over nature and over other human competitors would be impossible. And, as victory means survival, and survival is the criterion of Intelligent "Correspondence," these qualities, though not expressed in the fundamental law of mind, may yet have been all the while understood by Mr. Spencer to form so many secondary consequences and corollaries of that law.

But here it is decidedly time to take our stand and refuse our aid in propping up Mr. Spencer's definition by any further good-natured translations and supplementary contributions of our own. It is palpable at a glance that a mind whose survival interest could only be adequately secured by such a wasteful array of energy squandered on side issues would be immeasurably inferior to one like that which we supposed a few pages back, in which the monomania of tribal preservation should be the one all-devouring passion.

Surely there is nothing in the essence of intelligence which should oblige it forever to delude itself as to its own ends, and to strive towards a goal successfully only at the cost of consciously appearing to have far other aspirations in view.

A furnace which should produce along with its metal fifty different varieties of ash and slag, a planing-mill whose daily yield in shavings far exceeded that in boards, would rightly be pronounced inferior to one of the usual sort, even though more energy should be displayed in its working, and at moments some of that energy be directly effective. If ministry to survival be the sole criterion of mental excellence, then luxury and amusement, Shakespeare, Beethoven, Plato, and Marcus Aurelius, stellar spectroscopy, diatom markings, and nebular hypotheses are by-products on too wasteful a scale. The slag-heap is too big – it abstracts more energy than it contributes to the ends of the machine; and every serious evolutionist ought resolutely to bend his attention henceforward to the reduction in number and amount of these outlying interests, and the diversion of the energy they absorb into purely prudential channels.

Here, then, is our dilemma: One man may say that the law of mental development is dominated solely by the principle of conservation; another, that richness is the criterion of mental evolution; a third, that pure cognition of the actual is the essence of worthy thinking – but who shall pretend to decide which is right? The umpire would have to bring a standard of his own upon the scene, which would be just as subjective and personal as the standards used by the contestants. And yet some standard there must be, if we are to attempt to define in any way the worth of different mental manifestations.

Is it not already clear to the reader's mind that the whole difficulty in making Mr. Spencer's law work lies in the fact that it is not really a constitutive, but a regulative, law of thought which he is erecting, and that he does not frankly say so? Every law of Mind must be either a law of the *cogitatum* or a law of the *cogitandum*. If it be a law in the sense of an analysis of what

we do think, then it will include error, nonsense, the worthless as well as the worthy, metaphysics, and mythologies as well as scientific truths which mirror the actual environment. But such a law of the *cogitatum* is already well known. It is no other than the association of ideas according to their several modes; or, rather, it is this association definitively perfected by the inclusion of the teleological factor of interest by Mr. Hodgson in the fifth chapter of his masterly *Time and Space*.

That Mr. Spencer, in the part of his work which we are considering, has no such law as this in view is evident from the fact that he has striven to give an original formulation to such a law in another part of his book, in that chapter, namely, on the associability of relations, in the first volume, where the apperception of times and places, and the suppression of association by similarity, are made to explain the facts in a way whose artificiality has puzzled many a simple reader.

Now, every living man would instantly define right thinking as thinking in correspondence with reality. But Spencer, in saying that right thought is that which conforms to existent outward relations, and this exclusively, undertakes to decide what the reality *is*. In other words, under cover of an apparently formal definition he really smuggles in a material definition of the most far-reaching import. For the Stoic, to whom *vivere convenienter naturae* was also the law of mind, the reality was an archetypal Nature; for the Christian, whose mental law is to discover the will of God, and make one's actions correspond thereto, *that* is the reality. In fact, the philosophic problem which all the ages have been trying to solve in order to make thought in some way correspond with it, and which disbelievers in philosophy call insoluble, is just that: What is the reality? All the thinking, all the conflict of ideals, going on in the world at the present moment is in some way tributary to this quest. To attempt, therefore, with Mr. Spencer, to decide the matter merely incidentally, to forestall discussion by a definition – to carry the position by surprise, in a word – is a proceeding savoring more of piracy than philosophy. No, Spencer's definition of what we ought to think cannot be suffered to lurk in ambush; it must stand out explicitly with the rest, and expect to be challenged and give an account of itself like any other ideal norm of thought.

We have seen how he seems to vacillate in his determination of it. At one time, "scientific" thought, mere passive mirroring of outward nature, purely registrative cognition; at another time, thought in the exclusive service of survival, would seem to be his ideal. Let us consider the latter ideal first, since it has the polyp's authority in its favor: "We must survive – that end must regulate all our thought." The poor man who said to Talleyrand, "*Il faut bien que je vive!*" expressed it very well. But criticise this ideals or transcend it as Talleyrand did by his cool reply, "*Je n'en vois pas la necessité*," and it can say nothing more for itself. *A priori* it is a mere brute teleological affirmation on a par with all others. Vainly you should hope to prove it to a person bent on

suicide, who has but the one longing – to escape, to cease. Vainly you would argue with a Buddhist or a German pessimist, for they feel the full imperious strength of the desire, but have an equally profound persuasion of its essential wrongness and mendacity. Vainly, too, would you talk to a Christian, or even to any believer in the simple creed that the deepest meaning of the world is moral. For they hold that mere conformity with the outward – worldly success and survival – is not the absolute and exclusive end. In the *failures* to "adjust" – in the rubbish-heap, according to Spencer – lies, for them, the real key to the truth – the sole mission of life being to teach that the outward actual is not the whole of being.

And, now – if, falling back on the scientific ideal, you say that to *know* is the one τέλος of intelligence – not only will the inimitable Turkish cadi in Layard's Nineveh praise God in your face that he seeks not that which he requires not, and ask, "Will much knowledge create thee a double belly?" – not only may I, if it please me, legitimately refuse to stir from my fool's paradise of theosophy and mysticism, in spite of all your calling (since, after all, your true knowledge and my pious feeling have alike nothing to back them save their seeming good to our respective personalities) – not only this, but to the average sense of mankind, whose ideal of mental nature is best expressed by the word "richness," your statistical and cognitive intelligence will seem insufferably narrow, dry, tedious, and unacceptable.

The truth appears to be that every individual man may, if it please him, set up his private categorical imperative of what rightness or excellence in thought shall consist in, and these different ideals, instead of entering upon the scene armed with a warrant – whether derived from the polyp or from a transcendental source – appear only as so many brute affirmations left to fight it out upon the chess-board among themselves. They are, at best, postulates, each of which must depend on the general consensus of experience as a whole to bear out its validity. The formula which proves to have the most massive destiny will be the true one. But this is a point which can only be solved *ambulando*, and not by any *a priori* definition. The attempt to forestall the decision is free to all to make, but all make it at their risk. Our respective hypotheses and postulates help to shape the course of thought, but the only thing which we all agree in assuming is, that thought will be coerced away from them if they are wrong. If Spencer to-day says, "Bow to the actual," whilst Swinburne spurns "compromise with the nature of things," I exclaim, "*Fiat justitia, pereat mundus*," and Mill says, "To hell I will go, rather than 'adjust' myself to an evil God," what umpire can there be between us but the future? The idealists and the empiricists confront each other like Guelphs and Ghibellines, but each alike waits for adoption, as it were, by the course of events.

In other words, we are all fated to be, *a priori*, teleologists whether we will or no. Interests which we bring with us, and simply posit or take our stand

upon, are the very flour out of which our mental dough is kneaded. The organism of thought, from the vague dawn of discomfort or ease in the polyp to the intellectual joy of Laplace among his formulas, is teleological through and through. Not a cognition occurs but feeling is there to comment on it, to stamp it as of greater or less worth. Spencer and Plato are *ejusdem farinae*. To attempt to hoodwink teleology out of sight by saying nothing about it, is the vainest of procedures. Spencer merely takes sides with the τέλος he happens to prefer, whether it be that of physical well-being or that of cognitive registration. He represents a particular teleology. Well might teleology (had she a voice) exclaim with Emerson's Brahma:

> "If the red slayer think he slays,
> Or if the slain think he is slain,
> They know not well the subtle ways
> I keep, and pass, and turn again.
>
> * * * * * * * * * *
>
> "They reckon ill who leave me out;
> When me they fly, I am the wings;
> I am the doubter and the doubt," etc.

But now a scientific man, feeling something uncanny in this omnipresence of a teleological factor dictating *how* the mind shall correspond – an interest seemingly tributary to nothing non-mental – may ask us what we meant by saying sometime back that in one sense it is perfectly possible to express the existence of interests in non-mental terms. We meant simply this: That the reactions or outward consequences of the interests could be so expressed. The interest of survival which has hitherto been treated as an ideal *should-be*, presiding from the start and marking out the way in which an animal must react, is, from an outward and physical point of view, nothing more than an objective future implication of the reaction (if it occurs) as an actual fact. If the animal's brain acts fortuitously in the right way, he survives. His young do the same. The reference to survival in noway preceded or conditioned the intelligent act; but the fact of survival was merely bound up with it as an incidental consequence, and may, therefore, be called accidental, rather than instrumental, to the production of intelligence. It is the same with all other interests. They are pleasures and pains incidentally implied in the workings of the nervous mechanism, and, therefore, in their ultimate origin, non-mental; for the idiosyncrasies of our nervous centers are mere "spontaneous variations," like any of those which form the ultimate *data* for Darwin's theory. A brain which functions so as to insure survival may, therefore, be called intelligent in no other sense than

a tooth, a limb, or a stomach, which should serve the same end – the sense, namely, of appropriate; as when we say "that is an intelligent device," meaning a device fitted to secure a certain end which we assume. If *nirvana* were the end, instead of survival, then it is true the means would be different, but in both cases alike the end would not precede the means, or even be coeval with them, but depend utterly upon them, and follow them in point of time. The fox's cunning and the hare's speed are thus alike creations of the non-mental. The τέλος they entail is no more an agent in one case than another, since in both alike it is a resultant. Spencer, then, seems justified in not admitting it to appear as an irreducible ultimate factor of Mind, any more than of Body.

This position is perfectly unassailable so long as one describes the phenomena in this manner from without. The τέλος in that case can only be hypothetically, not imperatively, stated: *if* such and such be the end, then such brain functions are the most intelligent, just as such and such digestive functions are the most appropriate. But such and such cannot be declared *as* the end, except by the commenting mind of an outside spectator. The organs themselves, in their working at any instant, cannot but be supposed indifferent as to what product they are destined fatally to bring forth, cannot be imagined whilst fatally producing one result to have at the same time a notion of a different result which should be their truer end, but which they are unable to secure.

Nothing can more strikingly show, it seems to me, the essential difference between the point of view of consciousness and that of outward existence. We can describe the latter only in teleological terms, hypothetically, or else by the addition of a supposed contemplating mind which measures what it sees going on by its private teleological standard, and judges it intelligent. But consciousness itself is not merely intelligent in this sense. It is *intelligent intelligence*. It seems both to supply the means and the standard by which they are measured. It not only *serves* a final purpose, but *brings* a final purpose – posits, declares it. This purpose is not a mere hypothesis – "*if* survival is to occur, then brain must so perform," etc. – but an imperative decree: "Survival *shall* occur, and, therefore, brain *must* so perform!" It seems hopelessly impossible to formulate anything of this sort in non-mental terms, and this is why I must still contend that the phenomena of subjective "interest," as soon as the animal consciously realizes the latter, appears upon the scene as an absolutely new factor, which we can only suppose to be latent thitherto in the physical environment by crediting the physical atoms, etc., each with a consciousness of its own, approving or condemning its motions.

This, then, must be our conclusion: That no law of the *cogitandum*, no normative receipt for excellence in thinking, can be authoritatively promulgated. The only formal canon that we can apply to mind which is unassailable is the barren truism that it must think rightly. We can express this in terms

of correspondence by saying that thought must correspond with truth; but whether that truth be actual or ideal is left undecided.

We have seen that the invocation of the polyp to decide for us that it is actual (apart from the fact that he does not decide in that way) is based on a principle which refutes itself if consistently carried out. Spencer's formula has crumbled into utter worthlessness in our hands, and we have nothing to replace it by except our several individual hypotheses, convictions, and beliefs. Far from being vouched for by the past, these are verified only by the future. They are all of them, in some sense, laws of the ideal. They have to keep house together, and the weakest goes to the wall. The survivors constitute the right way of thinking. While the issue is still undecided, we can only call them our prepossessions. But, decided or not, "go in" we each must for one set of interests or another. The question for each of us in the battle of life is, "Can we *come out* with it?" Some of these interests admit to-day of little dispute. Survival, physical well-being, and undistorted cognition of what is, will hold their ground. But it is truly strange to see writers like Messrs. Huxley and Clifford, who show themselves able to call most things in question, unable, when it comes to the interest of cognition, to touch it with their solvent doubt. They assume some mysterious imperative laid upon the mind, declaring that the infinite ascertainment of facts is its supreme duty, which he who evades is a blasphemer and child of shame. And yet these authors can hardly have failed to reflect, at some moment or other, that the disinterested love of information and still more the love of consistency in thought (that true scientific *oestrus*) and the ideal fealty to Truth (with a capital T), are all so many particular forms of aesthetic interest, late in their evolution, arising in conjunction with a vast number of similar aesthetic interests, and bearing with them no *a priori* mark of being worthier than these. If we may doubt one, we may doubt all. How shall I say that knowing fact with Messrs. Huxley and Clifford is a better use to put my mind to than feeling good with Messrs. Moody and Sankey, unless by slowly and painfully finding out that in the long run it works best?

I, for my part, cannot escape the consideration, forced upon me at every turn, that the knower is not simply a mirror floating with no foot hold anywhere and passively reflecting an order that he comes upon and finds simply existing. The knower is an actor, and co-efficient of the truth on one side, whilst on the other he registers the truth which he helps to create. Mental interests, hypotheses, postulates, so far as they are bases for human action – action which to a great extent transforms the world – help to *make* the truth which they declare. In other words, there belongs to mind, from its birth upward, a spontaneity, a vote. It is in the game, and not a mere looker-on; and its judgments of the *should-be*, its ideals, cannot be peeled off from the body of the *cogitandum* as if they were excrescences or meant at most survival. We know so little about the ultimate nature of things, or of ourselves,

that it would be sheer folly dogmatically to say that an ideal rational order may not be real. The only objective criterion of reality is coerciveness, in the long run, over thought. Objective facts, Spencer's outward relations, are real only because they coerce sensation. Any interest which should be coercive on the same massive scale would be *eodem jure* real. By its very essence, the reality of a thought is proportionate to the way it grasps us. Its intensity, its seriousness – its interest, in a word – taking these qualities, not at any given instant, but as shown by the total upshot of experience. If judgments of the *should-be* are fated to grasp us in this way, they are what "correspond." The ancients placed the conception of Fate at the bottom of things – deeper than the gods themselves. "The fate of thought," utterly barren and indeterminate as such a formula is, is the only unimpeachable regulative Law of Mind.

THE SENTIMENT OF RATIONALITY

William James, "The Sentiment of Rationality." *Mind* o.s. 4.3 (July 1879): 317–346.

I

What is the task which philosophers set themselves to perform? And why do they philosophise at all? Almost every one will immediately reply: They desire to attain a conception of the frame of things which shall on the whole be more rational than the rather fragmentary and chaotic one which everyone by gift of nature carries about with him under his hat. But suppose this rational conception attained by the philosopher, how is he to recognise it for what it is, and not let it slip through ignorance? The only answer can be that he will recognise its rationality as he recognises everything else, by certain subjective marks with which it affects him. When he gets the marks he may know that he has got the rationality.

What then are the marks? A strong feeling of ease, peace, rest, is one of them. The transition from a state of puzzle and perplexity to rational comprehension is full of lively relief and pleasure.

But this relief seems to be a negative rather than a positive character. Shall we then say that the feeling of rationality is constituted merely by the absence of any feeling of irrationality? I think there are very good grounds for upholding such a view. All feeling whatever, in the light of certain recent psychological speculations, seems to depend for its physical condition not on simple discharge of nerve-currents, but on their discharge under arrest, impediment or resistance. Just as we feel no particular pleasure when we breathe freely, but a very intense feeling of distress when the respiratory motions are prevented; so any unobstructed tendency to action discharges itself without the production of much cogitative accompaniment, and any perfectly fluent course of thought awakens but little feeling. But when the movement is inhibited or when the thought meets with difficulties, we experience a distress which yields to an opposite feeling of pleasure as fast as the obstacle is overcome. It is only when the distress is upon us that we can be said to strive, to crave, or to aspire. When enjoying plenary freedom to energise either in the way of motion or of thought, we are in a sort of an state in which we might say with Walt Whitman, if we cared to say anything about ourselves at such times, "I am sufficient as I am." This feeling of the sufficiency of the present moment, of its absoluteness – this absence of all need to explain it,

account for it or justify it – is what I call the Sentiment of Rationality. As soon, in short, as we are enabled from any cause whatever to think of a thing with perfect fluency, that thing seems to us rational.

Why we should constantly gravitate towards the attainment of such fluency cannot here be said. As this is not an ethical but a psychological essay, it is quite sufficient for our purposes to lay it down as an empirical fact that we strive to formulate rationally a tangled mass of fact by a propensity as natural and invincible as that which makes us exchange a hard high stool for an armchair or prefer travelling by railroad to riding in a springless cart.

Whatever modes of conceiving the cosmos facilitate this fluency of our thought, produce the sentiment of rationality. Conceived in such modes Being vouches for itself and needs no further philosophic formulation. But so long as mutually obstructive elements are involved in the conception, the pent-up irritated mind recoiling on its present consciousness will criticise it, worry over it, and never cease in its attempts to discover some new mode of formulation which may give it escape from the irrationality of its actual ideas.

Now mental ease and freedom may be obtained in various ways. Nothing is more familiar than the way in which mere custom makes us at home with ideas or circumstances which, when new, filled the mind with curiosity and the need of explanation. There is no more common sight than that of men's mental worry about things incongruous with personal desire, and their thoughtless incurious acceptance of whatever happens to harmonise with their subjective ends. The existence of evil forms a "mystery" – a "problem": there is no "problem of happiness." But, on the other hand, purely theoretic processes may produce the same mental peace which custom and congruity with our native impulses in other cases give; and we have forthwith to discover how it is that so many processes can produce the same result; and how Philosophy, by emulating or using the means of all, may attain to a conception of the world which shall be rational in the maximum degree, or be warranted in the most composite manner against the inroads of mental unrest or discontent.

II

It will be best to take up first the theoretic way. The facts of the world in their sensible diversity are always before us, but the philosophic need craves that they should be conceived in such a way as to satisfy the sentiment of rationality. The philosophic quest then is the quest of a conception. What now is a *conception?* It is a *teleological instrument*. It is a partial aspect of a thing which *for our purpose* we regard as its essential aspect, as the representative of the entire thing. In comparison with this aspect, whatever other properties and qualities the thing may have, are unimportant accidents which we may without blame ignore. But the essence, the ground of conception, varies with

the end we have in view. A substance like oil has as many different essences as it has uses to different individuals. One man conceives it as a combustible, another as a lubricator, another as a food; the chemist thinks of it as a hydro-carbon; the furniture-maker as a darkener of wood; the speculator as a commodity whose market price to-day is this and to-morrow that. The soap-boiler, the physicist, the clothes-scourer severally ascribe to it other essences in relation to their needs. Ueberweg's doctrine[1] that the essential quality of a thing is the quality of most *worth*, is strictly true; but Ueberweg has failed to note that the worth is wholly relative to the temporary interests of the conceiver. And, even, when his interest is distinctly defined in his own mind, the discrimination of the quality in the object which has the closest connexion with it, is a thing which no rules can teach. The only *a priori* advice that can be given to a man embarking on life with a certain purpose is the somewhat barren counsel: Be sure that in the circumstances that meet you, you attend to the *right* ones for your purpose. To pick out the right ones is the measure of the man. "Millions," says Hartmann, "stare at the phenomenon before a *genialer Kopf* pounces on the concept."[2] The genius is simply he to whom, when he opens his eyes upon the world, the "right" characters are the prominent ones. The fool is he who, with the same purposes as the genius, infallibly gets his attention tangled amid the accidents.

Schopenhauer expresses well this ultimate truth when he says that Intuition (by which in this passage he means the power to distinguish at a glance the essence amid the accidents) "is not only the source of all knowledge, but is knowledge κατ' ⸗ξοχ⸗ν ... is real *insight*.... *Wisdom*, the true view of life, the right look at things, and the judgment that hits the mark, proceed from the mode in which the man conceives the world which lies before him.... He who excels in this talent knows the (Platonic) ideas of the world and of life. Every case he looks at stands for countless cases; more and more he goes on to conceive of each thing in accordance with its true nature, and his acts like his judgments bear the stamp of his insight. Gradually his face too acquires the straight and piercing look, the expression of reason, and at last of wisdom. For the direct sight of essences alone can set its mark upon the face. Abstract knowledge about them has no such effect."[3]

The right conception for the philosopher depends then on his interests. Now the interest which he has above other men is that of reducing the manifold in thought to simple form. We can no more say why the philosopher is more peculiarly sensitive to this delight, than we can explain the passion some persons have for matching colours or for arranging cards

[1] *Logic*, English tr., p. 139.

[2] *Philosophie des Unbewussten*, 2te Auflage, p. 249.

[3] *Welt als Wille u. Vorstellung*, II., p. 83.

in a game of solitaire. All these passions resemble each other in one point; they are all illustrations of what may be called the aesthetic Principle of Ease. Our pleasure at finding that a chaos of facts is at bottom the expression of a single underlying fact is like the relief of the musician at resolving a confused mass of sound into melodic or harmonic order. The simplified result is handled with far less mental effort than the original data; and a philosophic conception of nature is thus in no metaphorical sense a labour-saving contrivance. The passion for parsimony, for economy of means in thought, is thus the philosophic passion *par excellence*, and any character or aspect of the world's phenomena which gathers up their diversity into simplicity will gratify that passion, and in the philosopher's mind stand for that essence of things compared with which all their other determinations may by him be overlooked.

Mere universality or extensiveness is then the one mark the philosopher's conceptions must possess. Unless they appear in an enormous number of cases they will not bring the relief which is his main theoretic need. The knowledge of things by their causes, which is often given as a definition of rational knowledge, is useless to him unless the causes converge to a minimum number whilst still producing the maximum number of effects. The more multiple are the instances he can see to be cases of his fundamental concept, the more flowingly does his mind rove from fact to fact in the world. The phenomenal transitions are no real transitions; each item is the same old friend with a slightly altered dress. This passion for unifying things may gratify itself, as we all know, at truth's expense. Everyone has friends bent on system and everyone has observed how, when their system has once taken definite shape, they become absolutely blind and insensible to the most flagrant facts which cannot be made to fit into it. The ignoring of data is, in fact, the easiest and most popular mode of obtaining unity in one's thought.

But leaving these vulgar excesses let us glance briefly at some more dignified contemporary examples of the hypertrophy of the unifying passion.

Its ideal goal gets permanent expression in the great notion of Substance, the underlying One in which all differences are reconciled. D'Alembert's often quoted lines express the postulate in its most abstract shape: "L'univers pour qui saurait l'embrasser d'un seul point de vue ne serait, s'il est permis de le dire, qu'un fait unique et une grande verité." Accordingly Mr. Spencer, after saying on page 158 of the first volume of his *Psychology*, that "no effort enables us to assimilate Feeling and Motion, they have nothing in common," cannot refrain on page 162 from invoking abruptly an "Unconditional Being common to the two."

The craving for Monism at any cost is the parent of the entire evolutionist movement of our day, so far as it pretends to be more than history. The

Philosophy of Evolution tries to show how the world at any given time may be conceived as absolutely identical, except in appearance, with itself at all past times. What it most abhors is the admission of anything which, appearing at a given point, should be judged essentially other than what went before. Notwithstanding the *lacunae* in Mr. Spencer's system; notwithstanding the vagueness of his terms; in spite of the sort of jugglery by which his use of the word "nascent" is made to veil the introduction of new primordial factors like consciousness, as if, like the girl in *Midshipman Easy,* he could excuse the illegitimacy of an infant, by saying it was a very little one – in spite of all this, I say, Mr. Spencer is, and is bound to be, the most popular of all philosophers, because more than any other he seeks to appease our strongest theoretic craving. To undiscriminating minds his system will be a sop; to acute ones a programme full of suggestiveness.

When Lewes asserts in one place that the nerve-process and the feeling which accompanies it are not two things but only two "aspects" of one and the same thing, whilst in other passages he seems to imply that the cognitive feeling and the outward thing cognised (which is always other than the nerve-process accompanying the cognitive act) are again one thing in two aspects (giving us thereby as the ultimate truth One Thing in Three Aspects, very much as Trinitarian Christians affirm it to be One God in Three Persons), – the vagueness of his mode only testifies to the imperiousness of his need of unity.

The crowning feat of unification at any cost is seen in the Hegelian denial of the Principle of Contradiction. One who is willing to allow that A and not-A are one, can be checked by few farther difficulties in Philosophy.

III

But alongside of the passion for simplification, there exists a sister passion which in some minds – though they perhaps form the minority – is its rival. This is the passion for distinguishing; it is the impulse to be *acquainted* with the parts rather than to comprehend the whole. Loyalty to clearness and integrity of perception, dislike of blurred outlines, of vague identifications, are its characteristics. It loves to recognise particulars in their full completeness, and the more of these it can carry the happier it is. It is the mind of Cuvier *versus* St. Hilaire, of Hume *versus* Spinoza. It prefers any amount of incoherence, abruptness and fragmentariness (so long as the literal details of the separate facts are saved) to a fallacious unity which swamps things rather than explains them.

Clearness *versus* Simplicity is then the theoretic dilemma, and a man's philosophic attitude is determined by the balance in him of these two cravings. When John Mill insists that the ultimate laws of nature cannot possibly be less numerous than the distinguishable qualities of sensation

which we possess, he speaks in the name of this aesthetic demand for clearness. When Prof. Bain says:[4] – "There is surely nothing to be dissatisfied with, or to complain of in the circumstance that the elements of our experience are in the last resort two and not one.... Instead of our being 'unfortunate' in not being able to know the essence of either matter or mind – in not comprehending their union, our misfortune would rather be to have to know anything different from what we do know," – he is animated by a like motive. All makers of architectonic systems like that of Kant, all multipliers of original principles, all dislikers of vague monotony, whether it bear the character of Eleatic stagnancy or of Heraclitic change, obey this tendency. *Ultimate kinds* of feeling bound together in harmony by laws, which themselves are *ultimate kinds* of relation, form the theoretic resting-place of such philosophers.

The unconditional demand which this need makes of a philosophy is that its fundamental terms should be representable. Phenomena are analysable into feelings and relations. Causality is a relation between two feelings. To abstract the relation from the feelings, to unify all things by referring them to a first cause, and to leave this latter relation with no term of feeling before it, is to violate the fundamental habits of our thinking, to baffle the imagination, and to exasperate the minds of certain people much as everyone's eye is exasperated by a magic-lantern picture or a microscopic object out of focus. Sharpen it, we say, or for heaven's sake remove it altogether.

The matter is not at all helped when the word Substance is brought forward and the primordial causality said to obtain between this and the phenomena; for Substance *in se* cannot be directly imaged by feeling, and seems in fact but to be a peculiar form of relation between feelings – the relation of organic union between a group of them and time. Such relations, represented as non-phenomenal entities, become thus the *bête noire* and pet aversion of many thinkers. By being posited as existent they challenge our acquaintance but at the same instant defy it by being defined as noumenal. So far is this reaction against the treatment of relational terms as metempirical entities carried, that the reigning British school seems to deny their function even in their legitimate sphere, namely as phenomenal elements or "laws" cementing the mosaic of our feelings into coherent form. Time, likeness, and unlikeness are the only phenomenal relations our English empiricists can tolerate. One of the earliest and perhaps the most famous expression of the dislike to relations considered abstractedly is the well-known passage from Hume: "When we run over libraries, persuaded of these principles, what havoc must we make! If we take in our hand any volume of divinity or school metaphysic, for

[4] "On Mystery, etc." *Fortnightly Review*, Vol. IV. N.S., page 394.

instance, let us ask, Does it contain any abstract reasoning concerning quantity or number? No. Does it contain any experimental reasoning concerning matter of fact existence? No. Commit it then to the flames: for it can contain nothing but sophistry and illusion."[5]

Many are the variations which succeeding writers have played on this tune. As we spoke of the excesses of the unifying passion, so we may now say of the craving for clear representability that it leads often to an unwillingness to treat any abstractions whatever as if they were intelligible. Even to talk of space, time, feeling, power, &c., oppresses them with a strange sense of uncanniness. Anything to be real for them must be representable in the form of a *lump*. Its other concrete determinations may be abstracted from, but its *tangible* thinghood must remain. Minds of this order, if they can be brought to psychologise at all, abound in such phrases as "tracts" of consciousness, "areas" of emotion, "molecules" of feeling, "agglutinated portions" of thought, "gangs" of ideas &c., &c.

Those who wish an amusing example of this style of thought should read *Le Cerveau* by the anatomist Luys, surely the very worst book ever written on the much-abused subject of mental physiology. In another work, *Psychologie réaliste,* by P. Sièrebois (Paris 1876), it is maintained that "our ideas exist in us in a molecular condition, and are subject to continual movements.... Their mobility is as great as that of the molecules of air or any gas." When we fail to recall a word it is because our ideas are hid in some distant corner of the brain whence they cannot come to the muscles of articulation, or else "they have lost their ordinary fluidity.... These ideal molecules are material portions of the brain which differs from all other matter precisely in this property which it possesses of subdividing itself into very attenuated portions which easily take on the likeness in form and quality of all external objects." In other words, when I utter the word 'rhinoceros' an actual little microscopic rhinoceros gallops towards my mouth.

A work of considerable acuteness, far above the vulgar materialistic level, is that of Czolbe, *Grundzüge einer extensionalen Erkenntnisstheorie* (1875). This author explains our ideas to be extended substances endowed with mutual penetrability. The matter of which they are composed is "elastic like india-rubber." When "concentrated" by "magnetic self-attraction" into the middle of the brain, its "intensity" is such that it becomes conscious. When the attraction ceases, the idea-substance expands and diffuses itself into infinite space and so sinks from consciousness.

Again passing over these *quasi*-pathological excesses, we come to a permanent and, for our purpose, most important fact – the fact that many minds of the highest analytic power will tolerate in Philosophy no unifying

[5] *Essays*, ed. Green and Grose, II., p. 135.

terms but elements immanent in phenomena, and taken in their phenomenal and representable sense. Entities whose attributes are not directly given in feeling, phenomenal relations functioning as entities, are alike rejected. Spinozistic Substance, Spencerian Unknowable, are abhorred as unrepresentable things, numerically additional to the representable world. The substance of things for these clear minds can be no more than their common measure. The phenomena bear to it the same relation that the different numbers bear to unity. These contain no other matter than the repeated unit, but they may be classed as prime numbers, odd numbers, even numbers, square numbers, cube numbers, &c., just as truly and naturally as we class concrete things. The molecular motions, of which physicists hope that some day all events and properties will be seen to consist, form such an immanent unity of colossal simplifying power. The "infinitesimal event" of various modern writers, Taine for example, with its two "aspects," inner and outer, reaches still farther in the same direction. Writers of this class, if they deal with Psychology, repudiate the "soul" as a scholastic entity. The phenomenal unity of consciousness must flow from some element immutably present in each and every representation of the individual and binding the whole into one. To unearth and accurately define this phenomenal self becomes one of the fundamental tasks of Psychology.

But the greatest living insister on the principle that unity in our account of things shall not overwhelm clearness, is Charles Renouvier. His masterly exposition of the irreducible categories of thought in his *Essais de Critique générale* ought to be far better known among us than it is. The onslaughts which this eminently clear-headed writer has made and still makes in his weekly journal, the *Critique Philosophique*, on the vanity of the evolutionary principle of simplification, which supposes that you have explained away all distinctions by simply saying "they arise" instead of "they are," form the ablest criticism which the school of Evolution has received. Difference "thus displaced, transported from the *esse* to the *fieri*, is it any the less postulated? And does the *fieri* itself receive the least commencement of explanation when we suppose that everything which occurs, occurs little by little, by insensible degrees, so that, if we look at any one of these degrees, what happens does so as easily and clearly as if it did not happen at all? ... If we want a continuous production *ex nihilo*, why not say so frankly, and abandon the idea of a 'transition without break' which explains really nothing?"[6]

[6] *Critique Philosophique*, 12 Juillet, 1877, p. 383.

IV

Our first conclusion may then be this: No system of philosophy can hope to be universally accepted among men which grossly violates either of the two great aesthetic needs of our logical nature, the need of unity and the need of clearness, or entirely subordinates the one to the other. Doctrines of mere disintegration like that of Hume and his successors, will be as widely unacceptable on the one hand as doctrines of merely engulphing substantialism like those of Schopenhauer, Hartmann and Spencer on the other. Can we for our own guidance briefly sketch out here some of the conditions of most favourable compromise?

In surveying the connexions between data we are immediately struck by the fact that some are more intimate than others. Propositions which express those we call necessary truths; and with them we contrast the laxer collocations and sequences which are known as empirical, habitual or merely fortuitous. The former seem to have an *inward* reasonableness which the latter are deprived of. The link, whatever it be, which binds the two phenomena together, seems to extend from the heart of one into the heart of the next, and to be an essential reason why the facts should always and indefeasibly be as we now know them. "Within the pale we stand." As Lotze says:[7] – "The intellect is not satisfied with merely associated representations. In its constant critical activity thought seeks to refer each representation to the rational ground which conditions the alliance of what is associated and proves that what is grouped *belongs* together. So it separates from each other those impressions which merely coalesce without inward connexions, and it renews (while corroborating them) the bonds of those which, by the inward kinship of their content, have a right to permanent companionship."

On the other hand many writers seem to deny the existence of any such inward kinship or rational bond between things. Hume says: "All our distinct perceptions are distinct existences and the mind never perceives any real connexion among distinct existences."[8]

Hume's followers are less bold in their utterances than their master, but throughout all recent British Nominalism we find the tendency to enthrone mere juxtaposition as lord of all and to make of the Universe what has well been styled a Nulliverse. "For my part," says Prof. Huxley, "I utterly repudiate and, anathematise the intruder [Necessity]. Fact I know; and Law I know; but what is this Necessity, save an empty shadow of the mind's own throwing?"

And similarly J. S. Mill writes: "What is called explaining one law by another is but substituting one mystery for another, and does nothing to

[7] *Microcosmus*, 2nd ed. I., p. 261.

[8] *Treatise on Human Nature*, ed. T. H. Green, I., p. 559.

render the course of nature less mysterious. We can no more assign a *why* for the more extensive laws than for the partial ones. The explanation may substitute a mystery which has become familiar and has grown to seem not mysterious for one which is still strange. And this is the meaning of explanation in common parlance.... The laws thus explained or resolved are said to be *accounted for*; but the expression is incorrect if taken to mean anything more than what has been stated."[9]

And yet the very pertinacity with which such writers remind us that our explanations are in a strict sense of the word no explanations at all; that our causes never unfold the essential nature of their effects; that we never seize the inward reason why attributes cluster as they do to form things, seems to prove that they possess in their minds some ideal or pattern of what a genuine explanation would be like in case they should meet it. How could they brand our current explanations as spurious, if they had no positive notion whatever of the real thing?

Now have we the real thing? And yet may they be partly right in their denials? Surely both; and I think that the shares of truth may be easily assigned. Our "laws" *are* to a great extent but facts of larger growth, and yet things *are* inwardly and necessarily connected notwithstanding. The entire process of philosophic simplification of the chaos of sense consists of two acts, Identification and Association. Both are principles of union and therefore of theoretic rationality; but the rationality between things associated is outward and custom-bred. Only when things are identified do we pass inwardly and necessarily from one to the other.

The first step towards unifying the chaos is to classify its items. "Every concrete thing," says Prof. Bain, "falls into as many classes as it has attributes."[10] When we pick out a certain attribute to conceive it by, we literally and strictly identify it *in that respect* with the other concretes of the class having that attribute for its essence, concretes which the attribute recalls. When we conceive of sugar as a white thing it is *pro tanto* identical with snow; as a sweet thing it is the same as liquorice; *quâ* hydro-carbon, as starch. The attribute picked out may be *per se* most uninteresting and familiar, but if things superficially very diverse can be found to possess it buried within them and so be assimilated with each other, "the mind feels a peculiar and genuine satisfaction.... The intellect, oppressed with the variety and multiplicity of facts, is joyfully relieved by the simplification and the unity of a great principle."[11]

[9] *Logic*, 8th Edition, I., p. 549.

[10] *Ment. and Mor. Science*, p. 107.

[11] Bain, *Logic*, II, p. 120.

Who does not feel the charm of thinking that the moon and the apple are, as far as their relation to the earth goes, identical? of knowing respiration and combustion to be one? of understanding that the balloon rises by the same law whereby the stone sinks? of feeling that the warmth in one's palm when one rubs one's sleeve is identical with the motion which the friction checks? of recognising the difference between beast and fish to be only a higher degree of that between human father and son? of believing our strength when we climb or chop to be no other than the strength of the sun's rays which made the oats grow out of which we got our morning meal?

We shall presently see how the attribute performing this unifying function, becomes associated with some other attribute to form what is called a general law. But at present we must note that many sciences remain in this first and simplest classificatory stage. A classificatory science is merely one the fundamental concepts of which have few associations or none with other concepts. When I say a man, a lizard, and a frog are one in being vertebrates, the identification, delightful as it is in itself, leads me hardly any farther. "The idea that all the parts of a flower are modified leaves, reveals a connecting law, which surprises us into acquiescence. But now try and define the leaf, determine its essential characteristics, so as to include all the forms that we have named. You will find yourself in a difficulty, for all distinctive marks vanish, and you have nothing left, except that a leaf in this wider sense of the term is a lateral appendage of the axis of a plant. Try then to express the proposition 'the parts of a flower are modified leaves' in the language of scientific definition, and it reads, 'the parts of the flower are lateral appendages of the axis'."[12] Truly a bald result! Yet a dozen years ago there hardly lived a naturalist who was not thrilled with rapture at identifications in "philosophic" anatomy and botany exactly on a par with this. Nothing could more clearly show that the gratification of the sentiment of rationality depends hardly at all on the worth of the attribute which strings things together but almost exclusively on the mere fact of their being strung at all. Theological implications were the utmost which the attributes of archetypal zoology carried with them, but the wretched poverty of these proves how little they had to do with the enthusiasm engendered by archetypal identifications. Take Agassiz's conception of class-characters, order-characters &c., as "thoughts of God." What meagre thoughts! Take Owen's archetype of the vertebrate skeleton as revealing the artistic temperament of the Creator. It is a grotesque figure with neither beauty nor ethical suggestiveness, fitted rather to discredit than honour the Divine Mind. In short the conceptions led no farther than the identification pure and simple. The transformation which Darwin has effected in the classificatory sciences is simply this – that in his theory the class-essence is not a

[12] Helmholtz, *Popular Scientific Lectures*, p. 47.

unifying attribute pure and simple, but an attribute with wide associations. When a frog, a man and a lizard are recognised as one, not simply in having the same back-bone, &c., but in being all offspring of one parent, our thought instead of coming to a standstill, is immediately confronted with further problems and, we hope, solutions. Who were that parent's ancestors and cousins? Why was he chosen out of all to found such an enormous line? Why did he himself perish in the struggle to survive? &c.

Association of class-attributes *inter se*, is thus the next great step in the mind's simplifying industry. By it Empirical Laws are founded and sciences, from classificatory, become explanatory. Without it we should be in the position of a judge who could only decide that the cases in his court belonged each to a certain class, but who should be inhibited from passing sentence, or attaching to the class-name any further notion of duty, liability, or penalty. This *coupling* of the class-concept with certain determinate *consequences* associated therewithal, is what is practically important in the laws of nature as in those of society.

When, for example, we have identified prisms, bowls of water, lenses and strata of air as distorting media, the next step is to learn that all distorting media refract light rays towards the perpendicular. Such additional determination makes a law. But this law itself may be as inscrutable as the concrete fact we started from. The entrance of a ray and its swerving towards the perpendicular, may be simply *associated* properties, with, for aught we see, no inwardly necessary bond, coupled together as empirically as the colour of a man's eyes with the shape of his nose.

But such an empirical law may have its terms again classified. The essence of the medium may be to retard the light-wave's speed. The essence (in an obliquely-striking wave) of deflexion towards the perpendicular may be earlier retardation of that part of the wave-front which enters first, so that the remaining portion swings round it before getting in. Medium and bending towards perpendicular thus coalesce into the one identical fact of retardation. This being granted gives an inward explanation of all above it. But retardation itself remains an empirical coupling of medium and light-movement until we have classified both under a single concept. The explanation reached by the insight that two phenomena are at bottom one and the same phenomenon, is rational in the ideal and ultimate sense of the word. The ultimate identification of the subject and predicate of a mathematical theorem, an identification which we can always reach in our reasonings, is the source of the inward necessity of mathematical demonstration. We see that the top and bottom of a parallelogram must be equal as soon as we have unearthed in the parallelogram the attribute that it consists of two equal, juxtaposed triangles of which its top and bottom form homologous sides – that is, as soon as we have seen that top and bottom have an identical essence, their length, as being such sides, and that their position is an accident. This criterion of

identity is that which we all unconsciously use when we discriminate between brute fact and explained fact. There is no other test.

In the contemporary striving of physicists to interpret every event as a case of motion concealed or visible, we have an adumbration of the way in which a common essence may make the sensible heterogeneity of things inwardly rational. The cause is one motion, the effect the same motion transferred to other molecules; in other words, physics aims at the same kind of rationality as mathematics. In the second volume of Lewes's *Problems* we find this anti-Humean view that the effect is the "procession" of the cause, or that they are one thing in two aspects brought prominently forward.[13]

And why, on the other hand, do all our contemporary physical philosophers so vie with each other in the zeal with which they reiterate that in reality nerve-processes and brain-tremors "explain" nothing of our feelings? Why does "the chasm between the two classes of phenomena still remain intellectually impassable"?[14] Simply because, in the words of Spencer which we quoted a few pages back, feeling and motion have nothing whatever in common, no identical essence by which we can conceive both, and so, as Tyndall says, "pass by a process of reasoning from one to the other." The "double-aspect" school postulate the blank form of "One and the Same Fact," appeal to the image of the circle which is both convex and concave, and think that they have by this symbolic identification made the matter seem more rational.

Thus then the connexions of things become strictly rational only when, by successive substitutions of essences for things, and higher for lower essences, we succeed in reaching a point of view from which we can view the things as one. A and B are concretes; *a* and *b* are partial attributes with which for the present case we conceive them to be respectively identical (classify them) and which are coupled by a general law. M is a further attribute which rationally explains the general law as soon as we perceive it to form the essence of both *a* and *b*, as soon as we identify them with each other through it. The softening of asphalt pavements in August is explained first by the empirical law that heat, which is the essence of August, produces melting, which is the essence of the pavement's change, and secondly this law is inwardly rationalised by the conception of both heat and melting being at bottom one and the same fact, namely, increased molecular mobility.

Proximate and ultimate explanations are then essentially the same thing. Classification involves all that is inward in any explanation, and a perfected rationalisation of things means only a *completed* classification of them. Every

[13] This view is in growing favour with thinkers fed from empirical sources. See Wundt's *Physikalische Axiome* and the important article by A. Riehl, "Causalitat und Identität," in *Vierteljahrssch. f. wiss. Philos.* Bd. I., p. 265. The Humean view is ably urged by Chauncey Wright, *Philosophical Discussions*, N.Y. 1877, p. 406.

[14] Tyndall, *Fragments of Science*, 2nd ed., p. 121.

one feels that all explanation whatever, even by reference to the most proximate empirical law, does involve something of the essence of inward rationalisation. How else can we understand such words as these from Prof. Huxley? "The fact that it is impossible to comprehend how it is that a physical state gives rise to a mental state, no more lessens the value of our [empirical] explanation of the latter case, than the fact that it is utterly impossible to comprehend how motion is communicated from one body to another weakens the force of the explanation of the motion of one billiard-ball by showing that another has hit it."[15]

To return now to the philosophic problem. It is evident that our idea of the universe cannot assume an inwardly rational shape until each separate phenomenon is conceived as fundamentally identical with every other. But the important fact to notice is that in the steps by which this end is reached the really rationalising, pregnant moments are the successive steps of conception, the moments of picking out essences. The association of these essences into laws, the empirical coupling, is done by nature for us and is hardly worthy to be called an intellectual act. On the other hand the coalescence-into-one of all items in which the same essence is discerned, in other words the perception that an essence whether ultimate, simple and universal, or proximate and specific, is identical with itself wherever found, is a barren truism. The living question always is, Where *is* it found? To stand before a phenomenon and say *what* it is; in other words to pick out from it the embedded character (or characters) also embedded in the maximum number of *other* phenomena, and so identify it with them – here lie the stress and strain, here the test of the philosopher. So we revert to what we said far back: the genius can do no more than this; in Butler's words –

> "He knows *what's what*, and that's as high
> As metaphysic wit can fly."[16]

[15] "Modern Symposium," *XIXth Century*, Vol. I., 1877.

[16] This doctrine is perfectly congruous with the conclusion that identities are the only propositions necessary *a priori*, though of course it does not necessarily lead to that conclusion, since there may be in things elements which are not simple but bilateral or synthetic, like straightness and shortness in a line, convexity and concavity in a curve. Should the empiricists succeed in their attempt to resolve such Siamese-twin elements into habitual juxtapositions, the Principle of Identity would become the only *a priori* truth, and the philosophic problem like all our ordinary problems would become a question as to facts: *What* are these facts which we perceive to exist? Are there any existing facts corresponding to this or that conceived class? Lewes, in the interesting discussion on necessary and contingent truth in the Prolegomena to his *History* and in Chap. XIII. of his first *Problem*, seems at first sight to take up an opposite position, in that he maintains our commonly so-called contingent truths to be really necessary. But his treatment of the

V

We have now to ask ourselves how far this identification may be legitimately carried and what, when perfected, its real worth is. But before passing to these further questions we had best secure our ground by defending our fundamental notion itself from nominalistic attacks. The reigning British school has always denied that the same attribute *is* identical with itself in different individuals. I started above with the assumption that when we look at a subject with a certain purpose, regard it from a certain point of view, some one attribute becomes its essence and identifies it, *pro hac vice*, with a class. To this James Mill replies: "But what is meant by a mode of regarding things? This is mysterious; and is as mysteriously explained, when it is said to be the taking into view the particulars in which individuals agree. For what is there, which it is possible for the mind to take into view, in that in which individuals agree? Every colour is an individual colour, every size is an individual size, every shape is an individual shape. But things have no individual colour in common, no individual shape in common; no individual size in common; that is to say, they have neither shape, colour, nor size in common. What, then, is it which they have in common, which the mind can take into view? Those who affirmed that it was something, could by no means tell. They substituted words for things; using vague and mystical phrases, which, when examined, meant nothing";[17] the truth being according to this heroic author, that the only thing that can be possessed in common is a name. Black in the coat and black in the shoe agree only in that both are named black – the fact that on this view the *name* is never the same when used twice being quite overlooked. But the blood of the giants has grown weak in these days, and the nominalistic utterances of our contemporaries are like sweet-bells jangled, sadly out of tune. If they begin with a clear nominalistic note, they

question most beautifully confirms the doctrine I have advanced in the text. If the proposition "A is B" is ever true, he says it is so necessarily. But he proves the necessity by showing that what we mean by A is its essential attribute x, and what we mean by B is again x. Only *in so far* as A and B are identical is the proposition true. But he admits that a fact sensibly just like A may lack x, and a fact sensibly unlike B may have it. In either case the proposition to be true, must change. The contingency which he banishes from propositions, he thus houses in their terms; making as I do the act of conception, subsumption, classification, intuition, naming, or whatever else one may prefer to call it, the pivot on which thought turns. Before this act there is infinite indeterminateness – A and B may be anything. After the act there is the absolute certainty of truism – all x's are the same. *In* the act – is A, *x*? *is* B, *x*? or not? – we have the sphere of truth and error, of living experience, in short, of Fact. As Lewes himself says: "The only necessity is that a thing is what it is; the only contingency is that our proposition may not state what the thing is" (*Problems*, Vol. I., p. 395).

[17] *Analysis*, Vol. I., p. 249.

are sure to end with a grating rattle which sounds very like *universalia in re*, if not *ante rem*. In M. Taine,[18] who may fairly be included in the British School, they are almost *ante rem*. This *bruit de cloche fêlée* as the doctors say, is pathognomonic of the condition of Ockham's entire modern progeny.

But still we may find expressions like this: "When I say that the sight of any object gives me the *same* sensation or emotion to-day that it did yesterday, or the *same* which it gives to some other person, this is evidently an incorrect application of the word *same*; for the feeling which I had yesterday is gone never to return.... Great confusion of ideas is often produced, and many fallacies engendered, in otherwise enlightened understandings, by not being sufficiently alive to the fact (in itself always to be avoided), that they use the same name to express ideas so different as those of identity and undistinguishable resemblance."[19]

What are the exact facts? Take the sensation I got from a cloud yesterday and from the snow to-day. The white of the snow and that of the cloud differ in place, time and associates; they agree in quality, and we may say in origin, being in all probability both produced by the activity of the same brain tract. Nevertheless, John Mill denies our right to call the quality the same. He says that *it* essentially differs in every different occasion of its appearance, and that no two phenomena of which it forms part are really identical even as far as *it* goes. Is it not obvious that to maintain this view he must abandon the phenomenal plane altogether? Phenomenally considered, the white *per se is* identical with itself wherever found in snow or in cloud, to-day or to-morrow. If any nominalist deny the identity I ask him to point out the difference. *Ex hypothesi* the qualities are sensibly indistinguishable, and the only difference he can indicate is that of time and place; but these are not differences in the quality. If our quality be not the same with itself, what meaning has the word "same"? Our adversary though silenced may still grudge assent, but if he analyse carefully the grounds of this reluctance he will, I think, find that it proceeds from a difficulty in believing that the *cause* of the quality can be just the same at different times. In other words he abandons altogether the platform of the sensible phenomenon and ascends into the empyrean, postu-

[18] How can M. Taine fail to have perceived that the entire doctrine of "Substitution" so clearly set forth in the nominalistic beginning of his brilliant book is utterly senseless except on the supposition of realistic principles like those which he so admirably expounds at its close? How *can* the image be a useful substitute for the sensation, the tendency for the image, the name for the tendency, unless sensation, image, tendency and name be *identical* in some respect; in respect namely of function, of the relations they enter into? Were this realistic basis laid at the outset of Taine's *De l'Intelligence*, it would be one of the most consistent instead of one of the most self-contradictory works of our day.

[19] J. S. Mill, *Logic*, 8th Ed., I., p. 77.

lating some inner noumenal principle of *quality* + *time* + *place* + *concomitants*. The entire group being never twice alike, of course this ground, or being *in se*, of the quality must each time be distinct and, so to speak, personal. This transcendental view is frankly avowed by Mr. Spencer in his *Psychology*, II., p. 63 – (the passage is too complex to quote); but all nominalists must start from it, if they think clearly at all.[20]

We, who are phenomenists, may leave all metaphysical entities which have the power of producing whiteness to their fate, and content ourselves with the irreversible *datum* of perception that the whiteness after it *is* manifested is the same, be it here or be it there. Of all abstractions such entities are the emptiest, being ontological hypostatisations of the mere susceptibility of being distinguished, whilst this susceptibility has its real, nameable, phenomenal ground all the while, in the time, place, and relations affected by the attribute considered.

The truly wise man will take the phenomenon in its entirety and permanently sacrifice no one aspect to another. Time, place, and relations differ, he will freely say; but just as freely admit that the quality is identical with itself through all these differences. Then if, *to satisfy the philosophic interest*, it becomes needful to conceive this identical part as the essence of the several entire phenomena, he will gladly call them one; whilst if some other interest be paramount, the points of difference will become essential and the identity an accident. Realism is eternal and invincible in this phenomenal sense.

We have thus vindicated against all assailants our title to consider the world as a matter susceptible of rational formulation in the deepest, most inward sense, and not as a disintegrated sand-heap; and we are consequently at liberty to ask: (1) Whether the mutual identification of its items meet with any necessary limit; and (2) What, supposing the operation completed, its real worth and import amount to.

VI

In the first place, when we have rationally explained the connexion of the items A and B by identifying both with their common attribute x, it is obvious that we have really explained only so much of these items as *is* x. To explain the connexion of choke-damp and suffocation by the lack of oxygen is to leave

[20] I fear that even after this some persons will remain unconvinced, but then it seems to me the matter has become a dispute about words. If my supposed adversary, when he says that different times and places prevent a quality which appears in them from ever being twice the same, will admit that they do not make it in any conceivable way *different*, I will willingly abandon the words "same" and "identical" to his fury; though I confess it becomes rather inconvenient to have no single positive word left by which to indicate complete absence of difference.

untouched all the other peculiarities both of choke-damp and of suffocation, such as convulsions and agony on the one hand, density and explosibility on the other. In a word, so far as A and B contain *l*, *m*, *n* and *o*, *p*, *q*, respectively in addition to *x*, they are not explained by *x*. Each additional particularity makes its distinct appeal to our rational craving. A single explanation of a fact only explains it from a single point of view.[21] The entire fact is not accounted for until each and all of its characters have been identified with their likes elsewhere. To apply this now to universal formulas we see that the explanation of the world by molecular movements explains it only so far as it actually *is* such movements. To invoke the "Unknowable" explains only so much as is unknowable; "Love" only so much as is love; "Thought," so much as is thought; "Strife" so much as is strife. All data whose actual phenomenal quality cannot be identified with the attribute invoked as Universal Principle, remain outside as ultimate, independent *kinds* or *natures*, associated by empirical laws with the fundamental attribute but devoid of truly rational kinship with it. If A and B are to be *thoroughly* rationalised together, *l*, *m*, *n* and *o*, *p*, *q*, must each and all turn out to be so many cases of *x* in disguise. This kind of wholesale identification is being now attempted by physicists when they conceive of all the ancient, separate Forces as so many determinations of one and the same essence, molecular mass, position and velocity.

Suppose for a moment that this idea were carried out for the physical world, – the subjective sensations produced by the different molecular energies, colour, sound, taste, &c., &c., the relation of likeness and contrast, of time and position, of ease and effort, the emotions of pain and delight, in short, all the mutually irreducible categories of mental life, would still remain over. Certain writers strive in turn to reduce all these to a common measure, the primordial unit of feeling, or infinitesimal mental event which builds them up as bricks build houses. But this case is wholly different from the last. The physical molecule is conceived not only as having a being *in se* apart from representation, but as being essentially of representable kind. With magnified perceptions we should actually see it. The mental molecule, on the other hand, has by its very definition no existence except in being felt, and yet by the same definition never is felt. It is neither a fact in consciousness nor a fact out of

[21] In the number of the *Journal of Speculative Philosophy* for April 1879, Prof. John Watson most admirably asserts and expresses the truth which constitutes the back-bone of this article, namely that every manner of conceiving a fact is relative to some interest, and that there are no absolutely essential attributes – every attribute having the right to call itself essential in turn, and the truth consisting of nothing less than all of them together. I avow myself unable to comprehend as yet this author's Hegelian point of view, but his pages 164 to 172 are a most welcome corroboration of what I have striven to advance in the text.

consciousness, and falls to the ground as a transcendental absurdity. Nothing could be more inconclusive than the empirical arguments for the existence of this noumenal feeling which Tame and Spencer draw from the sense of hearing.

But let us for an instant waive all this and suppose our feelings reduced to one. We should then have two primordial natures, the molecule of matter and the molecule of mind, coupled by an empirical law. Phenomenally incommensurable, the attempt to reduce them to unity by calling them two "aspects" is vain so long as it is not pointed out who is there *adspicere*; and the *Machtspruch* that they are expressions of one underlying Reality has no rationalising function so long as that reality is confessed unknowable. Nevertheless the absolute necessity of an identical material substratum for the different species of feeling on the one hand, and the genera feeling and motion on the other, if we are to have any evolutionary *explanation* of things, will lead to ever renewed attempts at an atomistic hylozoism. Already Clifford and Taine, Spencer, Fechner, Zöllner, G. S. Hall, and more besides, have given themselves up to this ideal.

But again let us waive this criticism and admit that even the chasm between feeling and motion may be rationally bridged by the conception of the bilateral atom of being. Let us grant that this atom by successive compoundings with its fellows builds up the universe; is it not still clear that each item in the universe would still be explained only as to its general *quality* and not as to its other particular determinations? The particulars depend on the exact number of primordial atoms existing at the outset and their exact distances from each other. The "universal formula" of Laplace which Du Bois-Reymond has made such striking use of in his lecture *Ueber die Grenzen des Naturerkennens*, cannot possibly get along with fewer than this almost infinite number of data. Their homogeneity does not abate their infinity – each is a separate empirical fact.

And when we now retract our provisional admissions, and deny that feelings incommensurable *inter se* and with motion can be possibly unified, we see at once that the reduction of the phenomenal Chaos to rational form must stop at a certain point. It is a limited process, – bounded by the number of elementary attributes which cannot be mutually identified, the specific *qualia* of representation, on the one hand, and, on the other, by the number of entities (atoms or monads or what not) with their complete mathematical determinations, requisite for deducing the fulness of the concrete world. All these irreducible data form a system, no longer phenomenally rational, *inter se*, but bound together by what is for us an empirical law. We merely find the system existing as a matter of fact, and write it down. In short, a plurality of categories and an infinity of primordial entities, determined according to these categories, is the minimum of philosophic baggage, the only possible compromise between the need of clearness and the need of unity. All simpli-

fication, beyond this point, is reached either by throwing away the particular concrete determinations of the fact to be explained, or else it is illusory simplification. In the latter case it is made by invoking some sham term, some pseudo-principle, and conglomerating it and the data into one. The principle may be an immanent element but no true universal: Sensation, Thought, Will are principles of this kind; or it may be a transcendent entity like Matter, Spirit, Substance, the Unknowable, the Unconscious, &c.[22] Such attempts do but postulate unification, not effect it; and if taken avowedly to represent a mere claim, may be allowed to stand. But if offered as actual explanations, though they may serve as a sop to the rabble, they can but nauseate those whose philosophic appetite is genuine and entire. If we choose the former mode of simplification and are willing to abstract from the particulars of time, place and combination in the concrete world, we may simplify our elements very much by neglecting the numbers and collocations of our primordial elements and attending to their qualitative categories alone. The system formed by these will then really rationalise the universe so far as its qualities go. Nothing can happen in it incommensurable with these data, and practically this abstract treatment of the world as quality is all that philosophers aim at. They are satisfied when they can see it to be a place in which none but these qualities appear, and in which the same quality appears not only once but identically repeats itself. They are willing to ignore, or leave to special sciences the knowledge of what times, places and concomitants the recurring quality is likely to affect. The *Essais de Critique générale* of Renouvier form, to my mind, by far the ablest answer to the philosophic need thus understood, clearness and unity being there carried each to the farthest point compatible with the other's existence.

VII

And now comes the question as to the worth of such an achievement. How much better off is the philosopher when he has got his system than he was before it? As a mere phenomenal system it stands between two fires. On the one hand the unbridled craver of unity scorns it, as being incompletely rational, still to a great extent an empirical sand-heap; whilst on the other the practical man despises its empty and abstract barrenness. All it says is that the elements of the world are such and such and that each is identical with itself wherever found; but the question: Where is it found? (which is for the practical man the all-important question about each element) he is left to

[22] The idea of "God" in its popular function is open to neither of these objections, being conceived as a phenomenon standing in causal relation to other phenomena. As such, however, it has no unifying function of a properly *explanatory* kind.

answer by his own wit. Which, of all the essences, shall here and now be held the essence of this concrete thing, the fundamental philosophy never attempts to decide. We seem thus led to the conclusion that a system of categories is, on the one hand, the only possible philosophy, but is, on the other, a most miserable and inadequate substitute for the fulness of the truth. It is a monstrous abridgment of things which like all abridgments is got by the absolute loss and casting out of real matter. This is why so few human beings truly care for Philosophy. The particular determinations which she ignores are the real matter exciting other aesthetic and practical needs, quite as potent and authoritative as hers. What does the moral enthusiast care for philosophical ethics? Why does the *Æsthetik* of every German philosopher appear to the artist like the abomination of desolation? What these men need is a particular counsel, and no barren, universal truism.

> "Grau, theurer Freund, ist alle Theorie
> Und grün des Lebens goldner Baum."

The entire man, who feels all needs by turns, will take nothing as an equivalent for Life but the fulness of living itself. Since the essences of things are as a matter of fact spread out and disseminated through the whole extent of time and space, it is in their spread-outness and alternation that he will enjoy them. When weary of the concrete clash and dust and pettiness, he will refresh him by an occasional bath in the eternal spring, or fortify himself by a daily look at the immutable Natures. But he will only be a visitor, not a dweller in the region; he will never carry the philosophic yoke upon his shoulders, and when tired of the gray monotony of her problems and insipid spaciousness of her results, will always escape gleefully into the teeming and dramatic richness of the concrete world.

So our study turns back here to its beginning. We started by calling every concept a teleological instrument (*supra* p. [**insert correct page number here**]). No concept can be a valid substitute for a concrete reality except with reference to a particular interest in the conceiver. The interest of theoretic rationality, the relief of identification, is but one of a thousand human purposes. When others rear their heads it must pack up its little bundle and retire till its turn recurs. The exaggerated dignity and value that philosophers have claimed for their solutions is thus greatly reduced. The only virtue their theoretic conception need have is simplicity, and a simple conception is an equivalent for the world only so far as the world is simple; the world meanwhile, whatever simplicity it may harbour, being also a mightily complex affair. Enough simplicity remains, however, and enough urgency in our craving to reach it, to make the theoretic function one of the most invincible and authoritative of human impulses. All ages have their intellectual populace. That of our own day prides itself particularly on its love of Science and Facts

and its contempt for all metaphysics. Just weaned from the Sunday-school nurture of its early years, with the taste of the catechism still in its mouth, it is perhaps not surprising that its palate should lack discrimination and fail to recognise how much of ontology is contained in the "Nature," "Force" and "Necessary Law," how much mysticism in the "Awe," "Progress" and "Loyalty to Truth" or whatever the other phrases may be with which it sweetens its rather meagre fare of fragmentary physiology and physics. But its own inconsistency should teach it that the eradication of music, painting and poetry, games of chance and skill, manly sports and all other aesthetic energies from human life, would be an easy task compared with that suppression of Metaphysics which it aspires to accomplish. Metaphysics of some sort there must be. The only alternative is between the good Metaphysics of clear-headed Philosophy and the trashy Metaphysics of vulgar Positivism. Metaphysics, the quest of the last clear elements of things, is but another name for thought which seeks thorough self-consistency; and so long as men must think at all, some will be found willing to forsake all else to follow that ideal.

VIII

Suppose then the goal attained. Suppose we have at last a Metaphysics in which clearness and unity join friendly hands. 'Whether it be over a system of interlocked elements, or over a substance, or over such a simple fact as "phenomenon" or "representation," need not trouble us now. For the discussion which follows we will call the result the metaphysical Datum and leave its composite or simple nature uncertain. Whichever it be, and however limited as we have seen be the sphere of its utility, it satisfies, if no other need, at least the need of rationality. But now I ask: Can that which is the ground of rationality in all else be itself properly called rational? It would seem at first sight that in the sense of the word we have hitherto alone considered, it might. One is tempted at any rate to say that, since the craving for rationality in a theoretic or logical sense consists in the identification of one thing with all other outstanding things, a unique datum which left nothing else outstanding would leave no play for further rational, demand, and might thus be said to quench that demand or to be rational *in se*. No *otherness* being left to annoy the mind we should sit down at peace.

In other words, just as the theoretic tranquillity of the boor results from his spinning no further considerations about his chaotic universe which may prevent him from going about his practical affairs; so any brute datum whatever (provided it were simple and clear) ought to banish mystery from the Universe of the philosopher and confer perfect theoretic peace, inasmuch as there would then be for him absolutely no further considerations to spin.

This in fact is what some persons think. Prof. Bain says: "A difficulty is solved, a mystery unriddled, when it can be shown to resemble something else;

to be an example of a fact already known. Mystery is isolation, exception, or it may be apparent contradiction: the resolution of the mystery is found in assimilation, identity, fraternity. When all things are assimilated, so far as assimilation can go, so far as likeness holds, there is an end to explanation; there is an end to what the mind can do, or can intelligently desire.... The path of science as exhibited in modern ages, is towards generality, wider and wider, until we reach the highest, the widest laws of every department of things; there explanation is finished, mystery ends, perfect vision is gained."

But unfortunately this first answer will not hold. Whether for good or evil, it is an empirical fact that the mind is so wedded to the process of seeing an *other* beside every item of its experience, that when the notion of an absolute datum which is all is presented to it, it goes through its usual procedure and remains *pointing* at the void beyond, as if in that lay further matter for contemplation. In short, it spins for itself the further positive consideration of a Nonentity enveloping the Being of its datum; and as that leads to no issue on the further side, back recoils the thought in a circle towards its datum again. But there is no logical identity, no natural bridge between nonentity and this particular datum, and the thought stands oscillating to and fro, wondering "Why was there anything but nonentity? Why just this universal datum and not another? Why any thing at all?" and finds no end, in wandering mazes lost. Indeed, Prof. Bain's words are so untrue that in reflecting men it is just when the attempt to fuse the manifold into a single totality has been most successful, when the conception of the universe as a *fait unique* (in D'Alembert's words) is nearest its perfection, that the craving for further explanation, the ontological Θαυμάζειν arises in its extremest pungency.

As Schopenhauer says, "The uneasiness which keeps the never-resting clock of metaphysics in motion, is the consciousness that the non-existence of this world is just as possible as its existence".[23]

The notion of Nonentity may thus be called the parent of the philosophic craving in its subtlest and profoundest sense. Absolute existence is absolute mystery. Although *selbstständig*, it is not *selbstverständlich*; for its relations with the Nothing remain unmediated to our understanding. One philosopher only, so far as I know, has pretended to throw a logical bridge over this chasm. Hegel, by trying to show that Nonentity and Being as actually determined are linked together by series of successive identities, binds the whole of possible thought into an adamantine unity with no conceivable outlying notion to disturb the free rotary circulation of the mind within its bounds. Since such unchecked motion constitutes the feeling of rationality, he must be held, if he has succeeded, to have eternally and absolutely quenched all its logical demands.

[23] *Welt als Wille &c.*, 3 Auflage, I., p. 189.

But for those who, like most of us, deem Hegel's heroic effort to have failed, nought remains but to confess that when all has been unified to its supreme degree, (Prof. Bain to the contrary notwithstanding), the notions of a Nonentity, or of a possible Other than the actual, may still haunt our imagination and prey upon the ultimate data of our system. The bottom of Being is left logically opaque to us, a *datum* in the strict sense of the word, something which we simply come upon and find, and about which, (if we wish to act,) we should pause and wonder as little as possible. In this confession lies the lasting truth of Empiricism, and in it Empiricism and imaginative Faith join hands. The logical attitude of both is identical, they both say there is a *plus ultra* beyond all we know, a womb of unimagined other possibility. They only differ in their sentimental temper: Empiricism says, "Into the *plus ultra* you have no right to carry your anthropomorphic affirmations"; Faith says, "You have no right to extend to it your denials." The mere ontologic emotion of wonder, of mystery, has in some minds such a tinge of the rapture of sublimity, that for this aesthetic reason alone, it will be difficult for any philosophic system completely to exorcise it.

In truth, the philosopher's logical tranquillity is after all in essence no other than the boor's. Their difference regards only the point at which each refuses to let further considerations upset the absoluteness of the data he assumes. The boor does so immediately, and is therefore liable at any moment to the ravages of many kinds of confusion and doubt. The philosopher does not do so till unity has been reached, and is therefore warranted against the inroads of *those* considerations – but only practically not essentially secure from the blighting breath of the *ultimate* "Why?" Positivism takes a middle ground, and with a certain consciousness of the beyond abruptly refuses by an inhibitory action of the will to think any further, stamps the ground and says "Physics, I espouse thee! for better or worse, be thou my absolute!"

The Absolute is what has not yet been transcended, criticised or made relative. So far from being something quintessential and unattainable as is so often pretended, it is practically the most familiar thing in life. Every thought is absolute to us at the moment of conceiving it or acting upon it. It only becomes relative in the light of further reflection. This may make it flicker and grow pale – the notion of nonentity may blow in from the infinite and extinguish the theoretic rationality of a universal datum. As regards this latter, absoluteness and rationality are in fact convertible terms. And the chief effort of the rationalising philosopher must be to gain an absoluteness for his datum which shall be *stable* in the maximum degree, or as far as possible removed from exposure to those further considerations by which we saw that the vulgar *Weltanshauung* may so promptly be upset. I shall henceforward call the further considerations which may supervene and make relative or derationalise a mass of thought, the *reductive* of that thought. The *reductive* of absolute being is thus nonentity, or the notion of an *aliter possibile* which

it involves. The reductive of an absolute physics is the thought that all material facts are representations in a mind. The reductive of absolute time, space, causality, atoms, &c., are the so-called antinomies which arise as soon as we think fully out the thoughts we have begun. The reductive of absolute knowledge is the constant potentiality of doubt, the notion that the next thought may always correct the present one – resulting in the notion that a noumenal world is there mocking the one we think we know. Whatever we think, some reductive seems in strict theoretic legitimacy always imminently hovering over our thought ready to blight it. Doubleness dismissed at the front door re-enters in the rear and spoils the rationality of the simple datum we flattered ourselves we had attained. Theoretically the task of the philosopher, if he cannot reconcile the datum with the reductive by the way of identification *à la* Hegel, is to exorcise the reductive so that the datum may hold up its head again and know no fear. Prof. Bain would no doubt say that nonentity was a pseud-idea not derived from experience and therefore meaningless, and so exorcise that reductive.[24] The antinomies may be exorcised by the distinction between potentiality and actuality.[25] The ordinary half educated materialist comforts himself against idealists by the notion that, after all, thought is such an obscure mystical form of existence that it is almost as bad as no existence at all, and need not be seriously taken into account by a sensible man.

If nothing else could be conceived than thoughts or fancies, these would be credited with the maximum of reality. Their reductive is the belief in an objective reality of which they are but copies. When this belief takes the form of the affirmation of a noumenal world contrasted with all possible thought, and therefore playing no other part than that of reductive pure and simple, – to discover the formula of exorcism becomes, and has been recognised ever since Kant to be, one of the principal tasks of philosophy rationally understood.

The reductive used by nominalists to discredit the self-identity of the same attribute in different phenomena is the notion of a still higher degree of identity. We easily exorcise this reductive by challenging them to show what the higher degree of sameness can possibly contain which is not already in the lower.

The notion of Nonentity is not only a reductive; it can assume upon occasion an exorcising function. If, for example, a man's ordinary mundane

[24] The author of *A Candid Examination of Theism* (Trübner, 1878) exorcises Nonentity by the notion of the all-excluding infinitude of Existence, – whether reasonably or not I refrain from deciding. The last chapter of this work (published a year after the present text was written), is on "the final Mystery of Things," and impresses in striking language much that I have said.

[25] See Renouvier: *Premier Essai*.

consciousness feels staggered at the improbability of an immaterial thinking-principle being the source of all things, Nonentity comes in and says, "Contrasted with me, (that is, considered simply as *existent*) one principle is as probable as another." If the same mundane consciousness recoils at the notion of providence towards individuals or individual immortality as involving, the one too infinite a subdivision of the divine attention, the other a too infinite accumulation of population in the heavens, Nonentity says, "As compared with me all quantities are one: the wonder is all there when God has found it worth His while to guard or save a single soul."

But if the philosopher fails to find a satisfactory formula of exorcism for his datum, the only thing he can do is to "blink" the reductive at a certain point, assume the Given as his necessary ultimate, and proceed to a life whether of contemplation or of action based on that. There is no doubt that this half wilful act of arrest, this acting on an opaque necessity, is accompanied by a certain pleasure. See the reverence of Carlyle for brute fact: "There is an infinite significance in Fact." "Necessity," says a German philosopher,[26] and he means not rational but simply given necessity, "is the last and highest point that we can reach in a rational conception of the world.... It is not only the interest of ultimate and definitive knowledge, but also that of the feelings, to find a last repose and an ideal equilibrium, in an uttermost datum which can simply not be other than it is."

Such is the attitude of ordinary men in their theism, God's fiat being in physics and morals such an uttermost datum. Such also is the attitude of all hard-minded analysts and *Verstandemenschen*. Renouvier and Hodgson, the two foremost contemporary philosophers, promptly say that of experience as a whole no account can be given, but do not seek to soften the abruptness of the confession or reconcile us with our impotence.

Such mediating attempts may be made by more mystical minds. The peace of rationality may be sought through ecstacy when logic fails. To religious persons of every shade of doctrine moments come when the world as it is seems so divinely orderly, and the acceptance of it by the heart so rapturously complete, that intellectual questions vanish, nay the intellect itself is hushed to sleep – as Wordsworth says, "Thought is not, in enjoyment it expires." Ontological emotion so fills the soul that ontological speculation can no longer overlap it and put her girdle of interrogation-marks around existence. Even the least religious of men must have felt with our national ontologic poet, Walt Whitman, when loafing on the grass on some transparent summer morning, that "Swiftly arose and spread over him the peace and knowledge that pass all the argument of the earth." At such moments of energetic living we feel as if there were something diseased and contemptible, yea vile, in

[26] Dühring: *Cursus der Philosophie*, Leipzig 1876, p. 35.

theoretic grubbing and brooding. To feel "I *am* the truth" is to abolish the opposition between knowing and being.

Since the heart can thus wall out the ultimate irrationality which the head ascertains, the erection of its procedure into a systematised method would be a philosophic achievement of first-rate importance. As used by mystics hitherto it has lacked universality, being available for few persons and at few times, and even in these being apt to be followed by fits of "reaction" and "dryness"; but it may nevertheless be the forerunner of what will ultimately prove a true method. If all men could permanently say with Jacobi, "In my heart there is light," though they should for ever fail to give an articulate account of it, existence would really be rationalised.[27]

But if men should ever all agree that the mystical method is a subterfuge without logical pertinency, a plaster, but no cure, that the Hegelian method is fallacious, that the idea of Nonentity can therefore neither be exorcised nor identified, Empiricism will be the ultimate philosophy. Existence will be a brute Fact to which as a whole the emotion of ontologic wonder shall rightfully cleave, but remain eternally unsatisfied. This wonderfulness or mysteriousness will then be an essential attribute of the nature of things, and the exhibition and emphasising of it will always continue to be an ingredient in the philosophic industry of the race. Every generation will produce its Job, its Hamlet, its Faust or its Sartor Resartus.

With this we seem to have exhausted all the possibilities of purely theoretic rationality. But we saw at the outset that when subjectively considered ratio-

[27] A curious recent contribution to the construction of a universal mystical method is contained in the *Anaesthetic Revelation* by Benj. P. Blood (Amsterdam, N.Y., 1874). The author, who is a writer abounding in verbal felicities, thinks we may all grasp the secret of Being if we only intoxicate ourselves often enough with laughing-gas. "There is in the instant of recall from the anaesthetic stupor a moment in which the genius of being is revealed.... Patients try to speak of it but invariably fail in a lost mood of introspection.... But most will accept this as the central point of the illumination that sanity is not the basic quality of intelligence,... but that only in sanity is formal or contrasting thought, while the naked life is realised outside of sanity altogether. It is the instant contrast of this tasteless water of souls with formal thought as we *come to* that leaves the patient in an astonishment that the awful mystery of life is at last but a homely and common thing.... To minds of sanguine imagination there will be a sadness in the tenor of the mystery, as if the key-note of the universe were low – for no poetry, no emotion known to the normal sanity of man, can furnish a hint of its primeval prestige, and its all-but appalling solemnity; but for such as have felt sadly the instability of temporal things there is a comfort of serenity and ancient peace; while for the resolved and imperious spirit there are majesty and supremacy unspeakable." The logical characteristic of this state is said to be "an apodal sufficiency – to which sufficiency a wonder or fear of why it is sufficient cannot pertain and could be attributed only as an impossible disease or lack.... The disease of Metaphysics vanishes in the fading of the question and not in the coming of an answer."

nality can only be defined as perfectly unimpeded mental function. Impediments which arise in the purely theoretic sphere might perhaps be avoided if the stream of mental action should leave that sphere betimes and pass into the practical. The structural unit of mind is in these days, deemed to be a triad, beginning with a sensible impression, ending with a motion, and having a feeling of greater or less length in the middle. Perhaps the whole difficulty of attaining theoretic rationality is due to the fact that the very quest violates the nature of our intelligence, and that a passage of the mental function into the third stage before the second has come to an end in the *cul de sac* of its contemplation, would revive the energy of motion and keep alive the sense of ease and freedom which is its psychic counterpart. We must therefore inquire what constitutes the feeling of rationality in its *practical* aspect; but that must be done at another time and in another place.[28]

[28] This article is the first chapter of a psychological work on the motives which lead men to philosophise. It deals with the purely theoretic or logical impulse. Other chapters treat of practical and emotional motives and in the conclusion an attempt is made to use the motives as tests of the soundness of different philosophies.

ON THE FUNCTION OF COGNITION

William James, "On the Function of Cognition." *Mind* o.s. 10.1 (January 1885): 27–44.

The following inquiry is (to use a distinction familiar to readers of Mr. Shadworth Hodgson) not an inquiry into the "how it comes," but into the "what it is" of cognition. What we call acts of cognition are evidently realised through what we call brains and their events, whether there be "souls" dynamically connected with the brains or not. But with neither brains nor souls has this essay any business to transact. In it we shall simply assume that cognition *is* produced, somehow, and limit ourselves to asking what elements it contains, what factors it implies. In other words, our task is a purely analytic and introspective one; less important, possibly, than would be a successful research into the *causes* of cognition, but still interesting enough in its way.

Cognition is a function of consciousness. The first factor it implies is therefore a state of consciousness wherein the cognition shall take place. Having in *Mind* XXXIII. used the word "Feeling" to designate generically all states of consciousness considered subjectively, or without respect to their possible function, I shall then say that, whatever elements an act of cognition may imply besides, it at least implies the existence of a *feeling*. If the reader share the current antipathy to the word feeling, he may substitute for it, wherever I use it, the word "idea," taken in the old broad Lockian sense, or he may use the clumsy phrase "state of consciousness," or finally he may say "thought" instead.

Now it is to be observed that the common consent of mankind has agreed that some feelings are cognitive and some are simple facts having a subjective or, what one might almost call a physical, existence, but no such self-transcendent function as would be implied in their being pieces of knowledge. Our task is again limited here. We are not to ask, "How is self-transcendence possible?" We are only to ask, How comes it that common sense has assigned a number of cases in which it is assumed not only to be possible but actual? And what are the marks used by common sense to distinguish those cases from the rest? In short, our inquiry is a chapter in descriptive psychology, – hardly anything more.

Condillac embarked on a quest similar to this by his famous hypothesis of a statue to which various feelings were successively imparted. Its first feeling

was supposed to be one of fragrance. But to avoid all possible complication with the question of genesis, let us not attribute even to a statue the possession of our imaginary feeling. Let us rather suppose it attached to no matter, nor localized at any point in space, but left swinging in *vacuo*, as it were, by the direct creative *fiat* of a god. And let us also, to escape entanglement with difficulties about the physical or psychical nature of its "object," not call it a feeling of fragrance or of any other determinate sort, but limit ourselves to assuming that it is a feeling of *q*. What is true of it under this abstract name will be no less true of it in any more particular shape (such as fragrance, pain, hardness) the reader may suppose.

Now, if this feeling of *q* be the only creation of the god, it will of course form the entire universe. And if, to escape the cavils of that large class of persons who believe that *semper idem sentire ac non sentire* are the same,[1] we allow the feeling to be of as short a duration as they like, that universe will only need to last an infinitesimal part of a second. The feeling in question will thus be reduced to its fighting weight, and all that befalls it in the way of a cognitive function must be held to befall in the brief instant of its quickly snuffed-out life, – a life, it will also be noticed, that has no other moment of consciousness either preceding or following it.

Well now, can our little feeling, thus left alone in the universe, – for the god and we psychological critics may be supposed left out of the account, – can the feeling, I say, be said to have any sort of a cognitive function? For it to *know*, there must be something to be known. What is there, on the present supposition? One may reply, "the feeling's content *q*." But does it not seem more proper to call this the feeling's *quality* than its content? Does not the word "content" suggest that the feeling itself has already been discriminated as an act from its content as an object? And would it be quite safe to assume so promptly that the quality *q* of a feeling is one and the same thing with a feeling of the quality *q*? The quality *q*, so far, is an entirely subjective fact which the feeling carries in its pocket, so to speak, endogenously. If anyone

[1] "The Relativity of Knowledge," held in this sense, is, it may be observed in passing, one of the oddest of philosophic superstitions. Whatever facts may be cited in its favour are due to the properties of nerve-tissue, which may be exhausted by too prolonged an excitement. Patients with neuralgias that last unremittingly for days, can, however, assure us that the limits of this nerve-law are pretty widely drawn. But if we physically could get a feeling that should last eternally unchanged, what atom of logical or psychological argument is there to prove that it would not be felt as long as it lasted, and felt for just what it is, all that time? The reason for the opposite prejudice seems to be our reluctance to think that so *stupid* a thing as such a feeling would necessarily be, should be allowed to fill eternity with its presence. An interminable acquaintance, leading to no knowledge-*about*, – such would be its condition. (Since writing this note I have read with the greatest pleasure Stumpf's demolition of the Relativity-doctrine in §1 of his *Tonpsychologie*, and beg leave to urge the study of it upon all readers.)

pleases to dignify so simple a fact as this by the name of knowledge, of course nothing can prevent him. But let us keep closer to the path of common usage, and reserve the name knowledge for the cognition of "realities," meaning by realities things that exist independently of the feeling through which their cognition occurs. If the content of the feeling occur nowhere in the universe outside of the feeling itself, and perish with the feeling, common usage refuses to call it a reality, and brands it as a subjective feature of the feeling's constitution, or at the most as the feeling's *dream*.

For the feeling to be cognitive in the specific sense, then, it must be self-transcendent; and we must prevail upon the god to create a reality outside of it to correspond to its intrinsic quality *q*. Thus only can it be redeemed from the condition of being a solipsism. If now the new-created reality *resemble* the feeling's quality *q*, I say that the feeling may be held by us *to be cognisant of that reality*.

This first instalment of my thesis is sure to be attacked. But one word before defending it. "Reality" has become our warrant for calling a feeling cognitive; but what becomes our warrant for calling anything reality? *Quis custodiet custodem ipsum?* The only reply is – the faith of the psychologist, critic, or inquirer. At every moment of his life he finds himself subject to a belief in *some* realities, even though his realities of this year should prove to be his illusions of the next. Whenever he finds that the feeling he is studying contemplates what he himself regards as a reality, he must of course admit the feeling itself to be truly cognitive. We are ourselves the critics here; and we shall find our burden much lightened by being allowed to take reality in this relative and provisional way. Every science must make some assumptions. Psychologists and *Erkenntnisstheoretiker* are but fallible mortals. When they study the function of cognition, they do it by means of the same function in themselves. And knowing that the fountain cannot go higher than its source, we should promptly confess that our results in this field are affected by our own liability to err. The most we can claim is, that what we say about cognition may be counted as true as what we say *about anything else*. If our hearers agree with us about what are to be held "realities," they will perhaps also agree to our doctrine of the way in which they are known. We cannot ask for more.

Our terminology shall follow the spirit of these remarks. We will deny the function of knowledge to any feeling whose quality or content we do not ourselves believe to exist outside of that feeling as well as in it. We may call such a feeling a dream if we like; we shall have to see later on whether we can call it a fiction or an error.

To revert now to our thesis. Followers of Berkeley and Reid will immediately cry out, "How *can* a reality *resemble* a feeling?" Here we find how wise we were to name the quality of the feeling by an algebraic letter *q*. We flank the whole difficulty of resemblance between an inner state and an outward reality, by leaving it free to anyone to postulate as the reality whatever sort

of thing he thinks *can* resemble a feeling, – if not an outward thing, then another feeling like the first one, – the mere feeling *q* in the critic's mind for example. Evading thus this objection, we turn to another which is sure to be urged.

It will come from those philosophers to whom "thought," in the sense of a knowledge of relations, is the all in all of mental life; and who hold a merely "feeling"-consciousness to be no better – one would sometimes say from their utterances, a good deal worse – than no consciousness at all. Such phrases as these, for example, are common to-day in the mouths of those who claim to walk in the footprints of Kant and Hegel rather than in the ancestral English paths: "A perception detached from all others, 'left out of the heap we call a mind,' being out of all relation, has no qualities – is simply nothing. We can no more consider it than we can see vacancy." "It is simply in itself fleeting, momentary, unnameable (because while we name it it has become another), and for the very same reason unknowable, the very negation of knowability." "Exclude from what we have considered real all qualities constituted by relation, we find that none are left."

Although such citations as these from the late Professor Green might be multiplied almost indefinitely, it would hardly repay the pains, so egregiously false is the doctrine they teach. Our little supposed feeling, whatever it may be, from the cognitive point of view, whether a bit of knowledge or a dream, is certainly no psychical zero. It is a most positively and definitely qualified inner fact, with a complexion all its own. Of course there are many mental facts which it is *not*. It knows *q*, if *q* be a reality, with a very minimum of knowledge. It neither dates nor locates it. It neither classes nor names it. And it neither knows itself as a feeling, nor contrasts itself with other feelings, nor estimates its own duration or intensity. It is, in short, if there is no more of it than this, a most dumb and helpless and useless kind of thing.

But if we must describe it by so many negations, and if it can say nothing *about* itself or *about* anything else, by what right do we deny that it is a psychical zero? And may not the "relationists" be right after all?

In the innocent looking word "about" lies the solution of this riddle; and a simple enough solution it is when frankly looked at. A quotation from a too seldom quoted book, the *Exploratio Philosophica* of John Grote (London, 1865), p. 60, will form the best introduction to it.

> "Our knowledge may be contemplated in either of two ways, or, to use other words, we may speak in a double manner of the 'object' of knowledge. That is, we may either use language thus: we *know* a thing, a man, &c.; or we may use it thus: we know such and such things *about* the thing, the man, &c. Language in general, following its true logical instinct, distinguishes between these two applications of the notion of knowledge, the one being *gnònai, noscere, kennen, connaître,* the other

being *e˛d™nai, scire, wissen, savoir*. In the origin, the former may be considered more what I have called phenomenal – it is the notion of knowledge as *acquaintance* or familiarity with what is known; which notion is perhaps more akin to the phenomenal bodily communication, and is less purely intellectual than the other; it is the kind of knowledge which we have of a thing by the presentation to the senses or the representation of it in picture or type, a *Vorstellung*. The other, which is what we express in judgments or propositions, what is embodied in *Begriffe* or concepts without any necessary imaginative representation, is in its origin the more intellectual notion of knowledge. There is no reason, however, why we should not express our knowledge, whatever its kind, in either manner, provided only we do not confusedly express it, in the same proposition or piece of reasoning, in both."

Now obviously if our supposed feeling of *q* is (if knowledge at all) only knowledge of the mere acquaintance-type, it is milking a he-goat, as the ancients would have said, to try to extract from it any deliverance *about* anything under the sun, even about itself. And it is as unjust after our failure to turn upon it and call it a psychical nothing, as it would be, after our fruitless attack upon the billy-goat, to proclaim the non-lactiferous character of the whole goat-tribe. But the entire industry of the Hegelian school in trying to shove simple sensation out of the pale of philosophic recognition is founded on this false issue. It is always the "speechlessness" of sensation, its inability to make any "statement,"[2] that is held to make the very notion of it meaningless, and to justify the student of knowledge in scouting it out of existence. "Significance," in the sense of standing as the *sign* of other mental states, is taken to be the sole function of what mental states we have; and from the perception that our little primitive sensation has as yet no significance in this literal sense, it is an easy step to call it first meaningless, next senseless, then vacuous, and finally to brand it as absurd and inadmissible. But in this universal liquidation, this everlasting slip, slip, slip, of direct acquaintance into knowledge-*about*, of things into their relations, until at last nothing is left between which the relations can be supposed to obtain, does not all "significance" depart from the relations also? And when our knowledge "about" things has reached its never so complicated perfection, must there not needs abide alongside of it and inextricably mixed in with it some acquaintance with *what* things all this knowledge is about?

Now, our supposed little feeling gives a *what*; and if other feelings should succeed which remember the first, its *what* may stand as subject or predicate of some piece of knowledge-about, of some judgment, perceiving relations

[2] See, for example, Green's Introduction to Hume's *Treatise of Human Nature,* p. 36.

between it and other *whats*, which the other feelings may know. The hitherto dumb *q* will then receive a name and be no longer "speechless." But every name, as students of logic know, has its "denotation"; and the denotation always means some fact, or content, relationless *ab extra*, or with its internal relations unanalysed, like the *q* which our primitive sensation is supposed to know. No relation-expressing proposition is possible except on the basis of a preliminary acquaintance with such "facts," with such contents, as this. Let the *q* be fragrance, let it be toothache, or let it be a more complex kind of feeling, like that of the full-moon swimming in her blue abyss, it must first come in that simple shape, and be held fast in that "first intention," before any knowledge *about* it can be attained. The knowledge *about* it is *it* with a context added. Undo *it*, and what is added cannot be *con*text.[3]

Let us say no more then about this objection, but enlarge our thesis, thus: If there be in the universe a *q* other than the *q* in the feeling, the latter has acquaintance with an entity ejective to itself; an acquaintance moreover, which, as mere acquaintance, it is hard to imagine susceptible either of improvement or increase, being in its way complete; and which obliges us (so long as we refuse not to call acquaintance knowledge) to say not only that the feeling is cognitive, but that all qualities of feeling, so long as there is anything outside of them which they resemble, are feelings of qualities of existence, and perceptions of outward truth.

The point of this vindication of the cognitive function of the first feeling lies, it will be noticed, in the discovery that *q* does exist elsewhere than in it. In case this discovery were not made, we could not be sure the feeling was cognitive; and in case there were nothing outside to be discovered, we should have to call the feeling a dream. But the feeling itself cannot make the discovery. Its own *q* is the only *q* it grasps; and its own nature is not a particle altered by having the self-transcendent function of cognition either added to it or taken away. The function is accidental; synthetic, not analytic; and falls outside and not inside its being.[4]

[3] If A enters and B exclaims, "Didn't you see my brother on the stairs?" we all hold that A may answer, "I saw him, but didn't know he was your brother"; ignorance of brotherhood not abolishing power to see. But those who, on account of the unrelatedness of the first facts with which we become acquainted, deny them to be "known" to us, ought in consistency to maintain that if A did not perceive the relationship of the man on the stairs to B, it was impossible he should have noticed him at all.

[4] It seems paradoxical to call so important a function accidental, but I do not see how we can mend the matter. Just as, if we start with the reality and ask how it may come to be known, we can only reply by invoking a feeling which shall *reconstruct* it in its own more private fashion; so, if we start with the feeling and ask how it may come to know, we can only reply by invoking a reality which shall *reconstruct* it in its own more public fashion. In either case, however, the datum we start with remains just what it was. One

A feeling feels as a gun shoots. If there be nothing to be felt or hit, they discharge themselves *ins Blaue hinein*. If, however, something starts up opposite them, they no longer simply shoot or feel, they hit and know.

But with this arises a worse objection than any yet made. We the critics look on and see a real *q* and a feeling of *q*; and because the two resemble each other, we say the one knows the other. But what right have we to say this until we know that the feeling of *q* means to stand for or represent just that *same* other *q*? Suppose, instead of one *q*, a number of real *q*'s in the field. If the gun shoots and hits, we can easily see which one of them it hits. But how can we distinguish which one the feeling knows? It knows the one it stands for. But which one *does* it stand for? It declares no intention in this respect. It merely resembles; it resembles all indifferently; and resembling, *per se*, is not necessarily representing or standing-for at all. Eggs resemble each other, but do not on that account represent, stand for, or know each other. And if you say this is because neither of them is a *feeling*, then imagine the world to consist of nothing but toothaches, which *are* feelings, feelings resembling each other exactly, – would they know each other the better for all that?

The case of *q* being a bare quality like that of toothache-pain is quite different from that of its being a concrete individual thing. There is practically no test for deciding whether the feeling of a bare quality means to represent it or not. It can *do* nothing to the quality beyond resembling it, simply because an abstract quality is a thing to which nothing can be done. Being without context or environment or *principium individuationis*, a quiddity with no haecceity, a Platonic idea, even duplicate editions of such a quality (were they possible), would be indiscernible, and no sign could be given, no result altered, whether the feeling meant to stand for this edition or for that, or whether it simply resembled the quality without meaning to stand for it at all. Of our quality, resembling the feeling, and supposed to form the only reality in the world, we can say, however, that it is known to the feeling as much as in the nature of things it can possibly be known to any cognitive agency whatever, however perfect, – the feeling knowing of it all there is to be known, and standing for it and discriminating it as much as it admits of being discriminated and stood-for at all.

If now we grant a genuine pluralism of editions to the quality *q*, by assigning to each a *context* which shall distinguish it from its mates, we may proceed to explain which edition of it the feeling knows, by extending our principle of resemblance to the context too, and saying the feeling knows the particular

may easily get lost in verbal mysteries about the difference between quality of feeling and feeling of quality, between receiving and reconstructing the knowledge of a reality. But at the end we must confess that the notion of real cognition involves an unmediated dualism of the knower and the known. See Bowne's *Metaphysics*, New York, 1882, pp. 403–412, and various passages in Lotze, *e.g.*, *Logic*, §308.

q whose context it most exactly duplicates. But here again the theoretic doubt recurs: duplication and coincidence, are they knowledge? The gun shows which *q* it points to and hits, by *breaking* it. Until the feeling can show us which *q* it points to and knows, by some equally flagrant token, why are we not free to deny that it either points to or knows any one of the real *q*'s at all, and to affirm that the word "resemblance" exhaustively describes its relation to the reality?

Well, as a matter of fact, every actual feeling *does* show us, quite as flagrantly as the gun, which *q* it points to; and practically in concrete cases the matter is decided by an element we have hitherto left out. Let us pass from abstractions to possible instances, and ask our obliging *deus ex machina* to frame for us a richer world. Let him send me, for example, a dream of the death of a certain man, and let him simultaneously cause the man to die. How would our practical instinct spontaneously decide whether this were a case of cognition of the reality, or only a sort of marvellous coincidence of a resembling reality with my dream? Just such puzzling cases as this are what the "Society for Psychical Research" is busily collecting and trying to interpret in the most reasonable way.

If my dream were the only one of the kind I ever had in my life, if the context of the death in the dream differed in many particulars from the real death's context, and if my dream led me to no action about the death, unquestionably we should all call it a strange coincidence, and naught besides. But if the death in the dream had a long context, agreeing point for point with every feature that attended the real death; if I were constantly having such dreams, all equally perfect, and if on awaking I had a habit of acting immediately as if they were true and so getting 'the start' of my more tardily instructed neighbours, – we should probably all have to admit that I had some mysterious kind of clairvoyant power, that my dreams in an inscrutable way meant just those realities they figured, and that the word "coincidence" failed to touch the root of the matter. And whatever doubts anyone preserved would completely vanish, if it should appear that from the midst of my dream I had the power of *interfering* with the course of the reality, and making the events in it turn this way or that, according as I dreamed they should. Then at least it would be certain that my waking critics and my dreaming self were dealing with the *same*.

And thus do men invariably decide such a question. *The falling of the dream's practical consequences* into the real world, and the *extent* of the resemblance between the two worlds are the criteria they instinctively use.[5]

[5] The thoroughgoing objector might, it is true, still return to the charge, and, granting a dream which should completely mirror the real universe, and all the actions dreamed in which should be instantly matched by duplicate actions in this universe, still insist that this is nothing more than Leibnizian harmony, and that it is as far as ever from being made

All feeling is for the sake of action, all feeling results in action, – to-day no argument is needed to prove these truths. But by a most singular disposition of nature which we may conceive to have been different, *my feelings act upon the realities within my critic's world*. Unless, then, my critic can prove that my feeling does not "point to" those realities which it acts upon, how can he continue to doubt that he and I are alike cognisant of one and the same real world? If the action is brought about in one world, that must be the world the feeling intends; if in another world, *that* is the world the feeling has in mind. If your feeling bear no fruits in my world, I call it utterly detached from my world; I call it a solipsism, and call its world a dream-world. If your toothache do not prompt you to *act* as if I had a toothache, nor even as if I had a separate existence; if you neither say to me, "I know now how you must suffer!" nor ask me, "Do you know a remedy?" I deny that your feeling, however it may resemble mine, is really cognisant of mine. It gives no *sign* of being cognisant, and such a sign is absolutely necessary to my admission that it is.

Before I can think you to mean my world, you must affect my world; before I can think you to mean much of it, you must affect much of it; and before I can be sure you mean it *as I do*, you must affect it *just as I should* if I were in your place. Then I, your critic, will gladly believe that we are thinking, not only of the same reality, but that we are thinking it *alike*, and thinking a great part of its extent.

Without the practical effects of our neighbour's feelings on our own world, we should never suspect the existence of our neighbour's feelings at all, and of course should never find ourselves playing the critic as we do in this article. The constitution of nature is very peculiar. In the world of each of us are certain objects called human bodies, which move about and act on all the other objects there, and the occasions of their action are in the main what the occasions of our action would be, were they our bodies. They use words and gestures, which, if we used them, would have thoughts behind them, – no mere thoughts "*überhaupt*," however, but strictly determinate thoughts. I think you have the notion of fire in general, because I see you act towards this fire in my room just as I act towards it, – poke it and present your person towards it, and so forth. But that binds me to believe that if you feel "fire"

clear whether the dream-world refers to that other world, all of whose details it so closely copies. This objection leads deep into metaphysics. I do not impugn its importance, and justice obliges me to say that but for the teachings of my colleague, Dr. Josiah Royce, I should neither have grasped its full force nor made my own practical and psychological point of view as clear to myself as it is. On this occasion I prefer to stick steadfastly to that point of view; but I hope that Dr. Royce's more fundamental criticism of the function of cognition may ere long see the light.

at all, *this* is the fire you feel. As a matter of fact, whenever we constitute ourselves into psychological critics, it is not by dint of discovering which reality a feeling "resembles" that we find out which reality it means. We become first aware of which one it means, and then we suppose that to be the one it resembles. We see each other looking at the same objects, pointing to them and turning them over in various ways, and thereupon we hope and trust that all of our several feelings resemble the reality and each other. But this is a thing of which we are never theoretically sure. Still, it would practically be a case of *Grübelsucht*, if a ruffian were assaulting and drubbing my body, to spend much time in subtle speculation either as to whether his vision of our two bodies resembled mine, or as to whether the body he really *meant* to insult were not some body in his mind's eye, altogether other from my own. The practical point of view brushes such metaphysical cobwebs away. If what he have in mind be not *my* body, why call we it a body at all? His mind is inferred as a certain ejective term, to whose existence the things that happen in our two bodies point. The inference is quite void if the term, once inferred, be separated from its connexion with the two bodies that made me infer it, and connected with others that are no objects of mine at all. No matter for the metaphysical puzzle of how our two minds, the ruffian's and mine, *can* mean the same bodies. Men who see each other's bodies sharing the same space, treading the same earth, splashing the same water, making the same air resonant, and pursuing the same game and eating out of the same dish, will never practically believe in a pluralism of solipsistic worlds.

Where, however, the actions of one mind seem to take no effect in the world of the other, the case is different. This is what happens in poetry and fiction. Everyone knows *Ivanhoe*, for example; but so long as we stick to the story pure and simple without regard to the facts of its production, few would hesitate to admit that there are as many different "Ivanhoes" as there are different minds cognisant of the story.[6] The fact that all these "Ivanhoes"

[6] That is, there is no *real* "Ivanhoe," not even the one in Sir Walter Scott's mind as he was writing the story. That one is only the *first* one of the "Ivanhoe"-solipsisms. It is quite true we can *make* it the real "Ivanhoe" if we like, and then say that the other "Ivanhoes" know it or do not know it, according as they refer to and resemble it or no. This is done by bringing in Sir Walter Scott himself as the *author* of the real "Ivanhoe," and so making a complex object of both. This object, however, is not a story pure and simple. It has dynamic relations with the world common to the experience of all the readers. Sir Walter Scott's "Ivanhoe" got itself printed in volumes which we all can handle, and to any one of which we can refer to see which of our versions be the true one, *i.e.*, the original one of Scott himself. We can see the manuscript; in short we can get back to the "Ivanhoe" in Scott's mind by many an avenue and channel of this real world of our experience, – a thing we can by no means do with either the Ivanhoe or the Rebecca, either the Templar or the Isaac of York, of the story taken simply as such, and detached from

resemble each other does not prove the contrary. But if an alteration invented by one man in his version were to reverberate immediately through all the other versions, and produce changes therein, we should then easily agree that all these thinkers were thinking the *same* "Ivanhoe," and that, fiction or no fiction, it formed a little world common to them all.

Having reached this point, we may take up our thesis and improve it again. Still calling the reality by the name of *q* and letting the critic's feeling vouch for it, we can say that any other feeling will be held cognisant of *q*, provided it both resemble *q*, and refer to *q*, as shown by its either modifying *q* directly, or modifying some other reality, *p* or *r*, which the critic knows to be continuous with *q*. Or more shortly, thus: *The feeling of q knows whatever reality it resembles, and either directly or indirectly operates on.* If it resemble without operating, it is a dream; if it operate without resembling, it is an error.[7]

the conditions of its production. Everywhere, then, we have the same test: can we pass continuously from two objects in two minds to a third object which seems to be in *both* minds, because each mind feels every modification imprinted on it by the other? If so, the first two objects named are derivatives, to say the least, from the *same* third object, and may be held, if they resemble each other, to refer to one and the same reality.

[7] Among such errors are those cases in which our feeling operates on a reality which it does partially resemble, and yet does not intend: as for instance, when I take up your umbrella, meaning to take my own. I cannot be said here either to know your umbrella, or my own, which latter my feeling more completely resembles. I am mistaking them both, misrepresenting their context, &c.

We have spoken in the text as if the critic were necessarily one mind, and the feeling criticised another. But the criticised feeling and its critic may be earlier and later feelings of the same mind, and here it might seem that we could dispense with the notion of operating, to prove that critic and criticised are referring to and meaning to represent the *same*. We think we see our past feelings directly, and know what they refer to without appeal. At the worst, we can always fix the intention of our present feeling and *make* it refer to the same reality to which any one of our past feelings may have referred. So we need no "operating" here, to make sure that the feeling and its critic mean the same real *q*. Well, all the better if this is so! We have covered the more complex and difficult case in our text, and we may let this easier one go. The main thing at present is to stick to practical psychology, and ignore metaphysical difficulties.

One more remark. Our formula contains, it will be observed, nothing to correspond to the great principle of cognition laid down by Professor Ferrier in his *Institutes of Metaphysic* and apparently adopted by all the followers of Fichte, the principle, namely, that for knowledge to be constituted there must be knowledge of the knowing mind along with whatever else is known: not *q*, as we have supposed, but *q plus myself*, must be the least I can know. It is certain that the common sense of mankind never dreams of using any such principle when it tries to discriminate between conscious states that are knowledge and conscious states that are not. So that Ferrier's principle, if it have any relevancy at all, must have relevancy to the metaphysical possibility of consciousness at large, and not to the practically recognised constitution of cognitive consciousness. We may therefore pass it by without further notice here.

It is to be feared that the reader may consider this formula rather insignificant and obvious, and hardly worth the labour of so many pages, especially when he considers that the only cases to which it applies are *percepts,* and that the whole field of symbolic or conceptual thinking seems to elude its grasp. Where the reality is either a material thing or act, or a state of the critic's consciousness, I may both mirror it in my mind and operate upon it as soon as I perceive it. But there are many cognitions, universally allowed to be such, which neither mirror nor operate on their realities. As Reid says, "every man knows that he can relate the pain he suffered, not only without pain, but with pleasure; and that to suffer pain and think of it, are things which differ totally in kind and not in degree only."

In the whole field of symbolic thought we are universally held both to intend, to speak of, and to reach conclusions about – to know in short – particular realities, without having in our subjective consciousness any mind-stuff out of which an image of them might be framed. We are instructed about them by language which awakens no substantive consciousness beyond its sound; and we know *which* realities they are by the faintest and most fragmentary glimpse of some remote context they may have and by no direct imagination of themselves. As minds may differ here, let me speak in the first person. I am sure that my own current thinking has *words* for its almost exclusive subjective material, words which are made intelligible by being referred to some reality that lies beyond the horizon of direct consciousness, and of which I am only aware as of a *terminus* existing in a certain direction, to which the words might, but do not, lead. The *subject*, or *topic*, of the words is usually something *towards* which I mentally seem to pitch them in a backward way, almost as I might jerk my thumb over my shoulder to point at something, without looking round, if I were only entirely sure that it was there. The *upshot*, or *conclusion*, of the words is something towards which I seem to incline my head forwards, as if giving assent to its existence, though all my mind's eye catches sight of may be some tatter of an image connected with it, which tatter, however, if only endued with the feeling of familiarity and reality, makes me feel that the whole to which it belongs is rational and real, and fit to be let pass.

Here then is cognitive consciousness on a large scale, and yet what it knows, it hardly resembles in the least degree. The formula last laid down for our thesis must therefore be made more complete. We may now express it thus: *A Percept knows whatever reality it directly or indirectly operates on and resembles; a Conceptual Feeling, or Thought, refers to, and takes cognisance of,* [8] *a reality, whenever it actually or potentially terminates in a percept that operates on or resembles that reality.* The percept may be either sensation or sensorial idea; and when I say the thought must *terminate* in such a percept, I mean that it must

[8] Is an incomplete "thought about" that reality, that reality is its "topic," &c. See *Mind* XXXIII. 23.

be aware of the percept in one of those dim ways described in a former article,[9] that it must consciously look in the direction thereof, and ultimately be capable of leading up thereto, – by the way of practical experience, if the terminal feeling be a sensation; by the way of logical or habitual suggestion, if it be only an image in the mind.

Let an illustration make this plainer. I open the first book I take up, and read the first sentence that meets my eye: "Newton saw the handiwork of God in the heavens as plainly as Paley in the animal kingdom." I immediately look back and try to analyse the subjective state in which I rapidly apprehended this sentence as I read it. In the first place there was an obvious feeling that the sentence was intelligible and rational and related to the world of realities. There was also a sense of agreement or harmony between "Newton," "Paley," and "God." There was no apparent image connected with the words "heavens," or "handiwork," or "God"; they were words merely. With "animal kingdom" I think there was the faintest consciousness (it may possibly have been an image of the steps) of the Museum of Zoology in the town of Cambridge where I write. With "Paley" there was an equally faint consciousness of a small dark leather book; and with "Newton" a pretty distinct vision of the right-hand lower corner of a curling periwig. This is all the mind-stuff I can discover in my first consciousness of the meaning of this sentence, and I am afraid that even not all of this would have been present had I come upon the sentence in a genuine reading of the book, and not picked it out for an experiment. And yet my consciousness was truly cognitive. The sentence is "about realities" which my psychological critic – for we must not forget him – acknowledges to be such, even as he acknowledges my distinct feeling that they *are* realities, and my acquiescence in the general rightness of what I read of them, to be true knowledges on my part.

Now what justifies my critic in being as lenient as this? This singularly inadequate consciousness of mine, made up of symbols that neither resemble nor affect the realities they stand for, – how can he be sure it is cognisant of the very realities he has himself in mind?

He is sure because in countless like cases he has seen such inadequate and symbolic thoughts, by developing themselves, terminate in percepts that practically modified and presumably resembled his own. By "developing" themselves is meant obeying their tendencies, following up the suggestions nascently present in them, working in the direction in which they seem to point, clearing up the penumbra, making distinct the halo, unravelling the fringe, which is part of their composition, and in the midst of which their more substantive kernel of subjective content seems consciously to lie. Thus I may develop my thought in the Paley direction by procuring the brown leather volume and bringing the

[9] *Ibid.*, pp. 14–17, 19, 23–24.

passages about the animal kingdom before the critic's eyes. I may satisfy him that the words mean for me just what they mean for him, by showing him *in concreto* the very animals and their arrangements, of which the pages treat. I may get Newton's works and portraits; or if I follow the line of suggestion of the wig, I may smother my critic in seventeenth-century-matters pertaining to Newton's environment, to show that the word "Newton" has the same *locus* and relations in both our minds. Finally I may, by act and word, persuade him that what I mean by God and the heavens and the analogy of handiworks, is just what he means also.

My demonstration in the last resort is to his *senses*. My thought makes me act on his senses much as he might himself act on them, were he pursuing the consequences of a perception of his own. Practically then *my* thought terminates in *his* realities. He willingly supposes it, therefore, to be *of* them, and inwardly to *resemble* what his own thought would be, were it of the same symbolic sort as mine. And the pivot and fulcrum and support of his mental persuasion, is the sensible operation which my thought leads me, or may lead, to effect – the bringing of Paley's book, of Newton's portrait, &c., before his very eyes.

In the last analysis, then, we believe that we all know and think about and talk about the same world, because we believe our *percepts* are possessed by us in common. And we believe this because the percepts of each one of us seem to be changed in consequence of changes in the percepts of someone else. What you mean by me is in the first instance a percept of your own. Unexpectedly, however, I open and show you a book, uttering certain sounds the while. These acts are also your percepts, but they so resemble acts of yours with feelings prompting them, that you cannot doubt I have the feelings too, or that the book is one book felt in both our worlds. That it is felt in the same way, that my feelings of it resemble yours, is something of which we never can be sure, but which we assume as the simplest hypothesis that meets the case. As a matter of fact, we never *are* sure of it, and, as *Erkenntnisstheoretiker*, we can only say that of feelings that should *not* resemble each other, both could not know the same thing at the same time in the same way.[10] If each holds to its own percept as the reality, it is bound to say of the other percept, that, though it may *intend* that reality, and prove this by working change upon it, yet, if it do not resemble it, it is all false and wrong.[11]

If this be so of percepts, how much more so of higher modes of thought! Even in the sphere of sensation individuals are probably different enough.

[10] Though both might terminate in the same thing and be incomplete thoughts "about" it.

[11] The difference between Idealism and Realism is immaterial here. What is said in the text is consistent with either theory. A law by which my percept shall change yours directly is no more mysterious than a law by which it shall first change a reality, and then the reality change yours. In either case you and I seem knit into a continuous world, and not to form a pair of solipsisms.

Comparative study of the simplest conceptual elements seems to show a wider divergence still. And when it comes to general theories and emotional attitudes towards life, it is indeed time to say with Thackeray, "My friend, a different universe walks about under your hat and under mine."

What can save us at all and prevent us from flying asunder into a chaos of mutually repellent solipsisms? Through what can our several minds commune? Through nothing but the mutual *resemblance* of those of our feelings which have this strange power of modifying each other, *which are mere dumb knowledges-of-acquaintance*, and which must also resemble their realities or not know them aright at all. In such pieces of knowledge-of-acquaintance all our knowledge-about must end, and carry a sense of this possible termination as part of its content. These percepts, these *termini*, these sensible things, these mere matters-of-acquaintance, are the only realities we ever directly know, and the whole history of our thought is the history of our substitution of one of them for another, and the reduction of the latter to the status of a conceptual sign. Contemned though they be by some thinkers, these sensations are the mother-earth, the anchorage, the stable rock, the first and last limits, the *terminus a quo* and the *terminus ad quem* of the mind. To find such sensational *termini* should be our aim with all our higher thought. They end discussion; they destroy the false conceit of knowledge; and without them we are all at sea with each other's meaning. If two men act alike on a percept, they believe themselves to feel alike about it; if not, they may suspect they know it in differing ways. We can never be sure we understand each other till we are able to bring the matter to this test.[12] This is why metaphysical discussions are so much like fighting with the air; they have no practical issue of a sensational kind. "Scientific" theories, on the other hand, always terminate in definite percepts. You can deduce a possible sensation from your theory and, taking me into your laboratory, prove that your theory is true of my world by giving me the sensation then and there. Beautiful is the flight of conceptual reason through the upper air of truth. No wonder philosophers are dazzled by it still, and no wonder they look with some disdain at the low earth of feeling from which the goddess launched herself aloft. But woe to her if she return not home to its acquaintance; "*Nirgends haften dann die unsicheren Sohlen*": every crazy wind will take her, and, like a fire-balloon at night, she will go out among the stars.

[12] "There is no distinction of meaning so fine as to consist in anything but a possible difference of practice.... It appears, then, that the rule for attaining the [highest] grade of clearness of apprehension is as follows: Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object." Charles S. Peirce: "How to make our Ideas clear," in *Popular Science Monthly*, New York, January, 1878, p. 293.

THE PERCEPTION OF REALITY

William James, "The Perception of Reality." *The Principles of Psychology* (New York: Henry Holt, 1890), vol. 2, chap. 21, pp. 283–322.

BELIEF

Everyone knows the difference between imagining a thing and believing in its existence, between supposing a proposition and acquiescing in its truth. In the case of acquiescence or belief, the object is not only apprehended by the mind, but is held to have reality. Belief is thus the mental state or function of cognizing reality. As used in the following pages, 'Belief' will mean every degree of assurance, including the highest possible certainty and conviction.

There are, as we know, two ways of studying every psychic state. First, the way of analysis: What does it consist in? What is its inner nature? Of what sort of mind-stuff is it composed? Second, the way of history: What are its conditions of production, and its connection with other facts?

Into the first way we cannot go very far. *In its inner nature, belief or the sense of reality, is a sort of feeling more allied to the emotions than anything else.* Mr. Bagehot distinctly calls it the 'emotion' of conviction. I just now spoke of it as acquiescence. It resembles more than anything what in the psychology of volition we know as consent. Consent is recognized by all to be a manifestation of our active nature. It would naturally be described by such terms as 'willingness' or the 'turning of our disposition'. What characterizes both consent and belief is the cessation of theoretic agitation, though the advent of an idea which is inwardly stable, and fills the mind solidly to the exclusion of contradictory ideas. When this is the case, motor effects are apt to follow. Hence the states of consent and belief, characterized by repose on the purely intellectual side, are both intimately connected with subsequent practical activity. This inward stability of the mind's content is as characteristic of disbelief as of belief. But we shall presently see that we never disbelieve anything except for the reason that we believe something else which contradicts the first thing.[1] Disbelief is thus an incidental complication to belief, and need not be considered by itself.

[1] Compare this psychological fact with the corresponding logical truth that all negation rests on covert assertion of something else than the thing denied. (See Bradley's *Principles of Logic*, bk. 1. ch. 3.)

The true opposite of belief, psychologically considered, *are doubt and inquiry, not disbelief*. In both these states the content of our mind is in unrest, and the emotion engendered thereby is, like the emotion of belief itself, perfectly distinct, but perfectly indescribable in words. Both sorts of emotion may be pathologically exalted. One of the charms of drunkenness unquestionably lies in the deepening of the sense of reality and truth which is gained therein. In whatever light things may then appear to us, they seem more utterly what they are, more 'utterly utter' than when we are sober. This goes to a fully unutterable extreme in the nitrous oxide intoxication, in which a man's very soul will sweat with conviction, and he be all the while unable to tell what he is convinced of at all.[2] The pathological state opposed to this solidity and deepening has been called the questioning mania (*Grübelsucht* by the Germans). It is sometimes found as a substantive affection, paroxysmal or chronic, and consists in the inability to rest in any conception, and the need of having it confirmed and explained. 'Why do I stand here where I stand ?' 'Why is a glass a glass, a chair a chair?' 'How is it that men are only of the size they are? Why not as big as houses', etc., etc.[3] There is, it is true, another pathological state which is as far removed from doubt as from belief, and which some may prefer to consider the proper contrary of the latter state of mind. I refer to the feeling that everything is hollow, unreal, dead. I shall speak of this state again upon a later page. The point I wish to notice here is simply that belief and disbelief are but two aspects of one psychic state.

[2] See that very remarkable little work, *The Anaethetic Revelation and the Gist of Philosophy, by Benjamin P. Blood* (Amsterdam, N.Y., 1874). Compare also *Mind*, VII, 206.

[3] "To one whose mind is healthy thoughts come and go unnoticed, with me they have to be faced, thought about in a peculiar fashion, and then disposed of as finished, and this often when I am utterly wearied and would be at peace; but the call is imperative. This goes on to the hindrance of all natural action. If I were told that the staircase was on fire and I had only a minute to escape, and the thought arose – 'Have they sent for fire-engines? Is it probable that the man who has the key is at hand. Is the man a careful sort of person? Will the key be hanging on a peg? Am I thinking rightly? Perhaps they don't lock the depot.' My foot would be lifted to go down. I should be conscious to excitement that I was losing my chance – but I should be unable to stir, until all these absurdities were entertained and disposed of. In the most critical moments of my life, when I ought to have been so *engrossed as to leave no room for any secondary thoughts*, I have been oppressed by the inability to be at peace. And in the most ordinary circumstances it is all the same. Let me instance the other morning I went to walk. The day was biting cold, but1 was unable to proceed except by jerks. Once I got arrested – my feet in a muddy pool. One foot was lifted to go, knowing that it was not good to be standing in water, but there I was fast, the cause of detention being the discussing with myself the reasons why I should not stand in that pool." (T. S. Clouston: Clinical Lectures on Mental Diseases, 1883, p. 43. See also Berger, in *Archiv für Psychiatrie*, VI, 217.)

John Mill, reviewing various opinions about belief, comes to the conclusion that no account of it can be given:

> "What," he says "is the difference *to our minds* between thinking of a reality, and representing to ourselves an imaginary picture? I confess I can see no escape from the opinion that the distinction is ultimate and primordial. There is no more difficulty in holding it to be so, than in holding the difference between a sensation and an idea to be primordial. It seems almost another aspect of the same difference. ... I cannot help thinking, therefore, that there is in the remembrance of a real fact, as distinguished from that of a thought, an element which does not consist ... in a difference between the mere ideas which are present to the mind in the two cases. This element, howsoever we define it, constitutes Belief, and is the difference between Memory and Imagination. From whatever direction we approach, this difference seems to close our path. When we arrive at it, we seem to have reached, as it were, the central point of our intellectual nature, presupposed and built upon in every attempt we make to explain the more recondite phenomena of our mental being."[4]

If the words of Mill be taken to apply to the mere subjective analysis of belief – to the question, What does it feel like when we have it? – they must be held, on the whole, to be correct. Belief, the sense of reality, feels like itself – that is about as much as we can say.

Prof. Brentano, in an admirable chapter of his *Psychologie*, expresses this by saying that conception and belief (which he names *judgment*) are two different fundamental psychic phenomena. What I myself have called (Vol. I, p. 276) the 'object' of thought may be comparatively simple, like "Ha! what a pain," or "It-thunders"; or it may be complex, like "Columbus-discovered-America-in-1492," or "There-exists-an-all-wise-Creator-of-the-world." In either case, however, the mere thought of the object may exist as something quite distinct from the belief in its reality. The belief, as Brentano says, presupposes the mere thought:

> "Every object comes into consciousness in a twofold way, as simply thought of [*vorgestellt*] and as admitted [*anerkaant*] or denied. The relation is analogous to that which is assumed by most philosophers (by Kant no less than by Aristotle) to obtain between mere thought and desire. Nothing is ever desired without being thought of; but the desiring is nevertheless a second quite new and peculiar form of relation to the object, a second quite new way of receiving it into consciousness. No

[4] Note to James Mill's analysis, I, 412–423.

> more is anything judged [i.e., believed or disbelieved] which is not thought of too. But we must insist that, so soon as the object of a thought becomes the object of an assenting or rejecting judgment, our consciousness steps into an entirely new relation towards it. It is then twice present in consciousness, as thought of, and as held for real or denied; just as when desire awakens for it, it is both thought and simultaneously desired." (P. 266.)

The commonplace doctrine of 'judgment' is that it consists in the combination of 'ideas' by a 'copula' into a 'proposition', which may be of various sorts, as a formative, negative, hypothetical, etc. But who does not see that in a disbelieved or doubted or interrogative or conditional proposition, the ideas are combined in the same identical way in which they are in a proposition which is solidly believed? *The way in which the ideas are combined is a part of the inner constitution the thought's object or content.* That object is sometimes an articulated whole with relations between its parts, amongst which relations, that of predicate to subject may be one. But when we have got our object with its inner constitution thus defined in a proposition, then the question comes up regarding the object as a whole: 'Is it a real object? is this proposition a true proposition or not?' And in the answer *Yes* to *this* question lies that new psychic act which Brentano calls 'judgment', but which I prefer to call 'belief'.

In every proposition, then, so far as it is believed, questioned, or disbelieved, four elements are to be distinguished, the subject, the predicate, and their relation (of whatever sort it be) – these form the *object* of belief – and finally the psychic attitude in which our mind stands towards the proposition taken as a whole – and this is the belief itself.[5]

Admitting, then, that this attitude is a state of consciousness *sui generis*, about which nothing more can be said in the way of internal analysis, let us proceed to the second way of studying the subject of belief: *Under what circumstances do we think things real?* We shall soon see how much matter this gives us to discuss.

THE VARIOUS ORDERS OF REALITY.

Suppose a new-born mind, entirely blank and waiting for experience to begin. Suppose that it begins in the forms of visual impression (whether faint or vivid is immaterial) of a lighted candle against a dark background, and nothing else, so that whilst this image lasts it constitutes the entire universe

[5] For an excellent account of the history of opinion on this subject see A. Marty, in *Vierteljahrsschrift für wissenschaftliche Philosophie*, VIII, 161 ff. (1884).

known to the mind in question. Suppose, moreover (to simplify the hypothesis), that the candle is only imaginary, and that no 'original' of it is recognized by us psychologists outside. Will this hallucinatory candle be believed in, will it have a real existence for the mind?

What possible sense (for that mind) would a suspicion have that the candle was not real? What would doubt or disbelief of it imply? When *we*, the onlooking psychologists, say the candle is unreal, we mean something quite definite, viz., that there is a world known to *us* which is real, and to which we perceive that the candle does not belong; it belongs exclusively to that individual mind, has no *status* anywhere else, etc. It exists, to be sure, in a fashion, for it forms the content of that mind's hallucination; but the hallucination itself, though unquestionably it is a sort of existing fact, has no knowledge of *other* facts; and since those *other* facts are the realities *par excellence* for us, and the only things we believe in, the candle is simply outside of our reality and belief altogether.

By the hypothesis, however, the *mind which sees the candle* can spin no such considerations as these about it, for of other facts, actual or possible, it has no inkling whatever. That candle is its all, its absolute. Its entire faculty of attention is absorbed by it. It *is*, it is *that*; it is *there*; no other possible candle, or quality of this candle, no other possible place, or possible object in the place, no alternative, in short, suggests itself as even conceivable; so how can the mind help believing the candle real? The supposition that it might possibly not do so is, under the supposed conditions, unintelligible.[6]

This is what Spinoza long ago announced:

> "Let us conceive a boy," he said, "imagining to himself a horse, and taking note of nothing else. As this imagination involves the existence of the horse, *and the boy has no perception which annuls its resistance*, he will necessarily contemplate the horse as present, nor will he be able to doubt of its existence, however little certain of it he may be. I deny that a man in so far as he imagines [*percipit*] affirms nothing. For what is it to imagine a winged horse but to affirm that, the horse [that horse, namely] has wings? For if the mind had nothing before it but the winged horse it would contemplate the same as present, would have no cause to doubt of its existence, nor any power of dissenting from its existence, unless the imagination of the winged horse were joined to an idea which contradicted [*tollit*] its existence." (*Ethics*, II, 49, Scholium.)

[6] We saw near the end of Chapter XIX that a candle-image taking exclusive possession of the mind in this way would probably acquire the sensational vividness. But this physiological accident is logically immaterial to the argument in the text, which ought to apply as well to the dimmest sort of mental image as to the brightest sensation.

The sense that anything we think of is unreal can only come, then, when that thing is contradicted by some other thing of which we think. *Any object which remains uncontradicted is ipso facto believed and posited as absolute reality.*

Now, how comes it that one thing thought of can be contradicted by another? It cannot unless it begins the quarrel by saying something inadmissible about that other. Take the mind with the candle, or the boy with the horse. If either of them say, "That candle or that horse, even when I don't see it, exists in *the outer world*," he pushes into 'the outer world' an object which may be incompatible with everything which he otherwise knows of that world. If so, he must take his choice of which to hold by, the present perceptions or the other knowledge of the world. If he holds to the other knowledge, the present perceptions are contradicted, *so far as their relation to that world goes*. Candle and horse, whatever they may be, are not existents in outward space. They are existents, of course; they are mental objects; mental objects have existence as mental objects. But they are situated in their own spaces, the space in which they severally appear, and neither of those spaces is the space in which the realities called 'the outer world' exist.

Take again the horse with wings. If I merely dream of a horse with wings, my horse interferes with nothing else and has not to be contradicted. That horse, its wings, and its place, are all equally real. That horse exists no otherwise than as winged, and is moreover really there, for that place exists no otherwise than as the place of that horse, and claims as yet no connection with the other places of the world. But if with this horse I make an inroad into the *world otherwise known*, and say, for example, "That is my old mare Maggie, having grown a pair of wings where she stands in her stall," the whole case is altered; for now the horse and place are identified with a horse and place otherwise known, and *what* is known of the latter objects is incompatible with what is perceived with the former. "Maggie in her stall with wings! Never!" The wings are unreal, then, visionary. I have dreamed a lie about Maggie in her stall.

The reader will recognize in these two cases the two sorts of judgment called in the logic-books existential and attributive respectively. 'The candle exists as an outer reality' is an existential, 'My Maggie has got a pair of wings' is an attributive, proposition;[7] and it follows from what was first said that *all*

[7] In both existential and attributive judgments a synthesis is represented. The syllable *ex* in the word Existence, *da* in the word *Dasein*, express it. 'The candle exists' is equivalent to 'The candle is *over there*'. And the 'over there' means real space, space related to other reals. The proposition amounts to saying: 'The candle is in the same space with other reals'. It affirms of the candle a very concrete predicate – namely, this relation to other particular concrete things. *Their* real existence, as we shall later see, resolves itself into their peculiar relation to *ourselves*. Existence is thus no substantive quality when we predicate it of any object; it is a relation, ultimately terminating in ourselves, and at the

propositions, whether attributive or existential, are believed through the very fact of being conceived, unless they clash with other propositions believed at the same time, by affirming that their terms are the same with the terms of these other propositions. A dream-candle has existence, true enough; but not the same existence (existence for itself, namely, or *extra mentem meam*) which the candles of waking perception have. A dream-horse has wings; but then neither horse nor wings are the same with any horses or wings known to memory. That we can at any moment think of the same thing which at any former moment we thought of is the ultimate law of our intellectual constitution. But when we now think of it incompatibly with our other ways of thinking it, then we must choose which way to stand by, for we cannot continue to think in two contradictory ways at once. *The whole distinction of real and unreal, the whole psychology of belief, disbelief, and doubt, is thus grounded on two mental facts – first, that we are liable to think differently of the same; and second, that when we have done so, we can choose which way of thinking to adhere to and which to disregard*.

The subjects adhered to become real subjects, the attributes adhered to real attributes, the existence adhered to real existence; whilst the subjects disregarded become imaginary subjects, the attributes disregarded erroneous it attributes, and the existence disregarded an existence into no man's land, in the limbo "where footless fancies dwell." The real things are, in Mr. Taine's terminology, the *reductives* of the things judged unreal.

THE MANY WORLDS

Habitually and practically we do not *count* these disregarded things as existents at all. For them *Vae victis* is the law in the popular philosophy; they are not even treated as appearances; they are treated as if they were mere waste, equivalent to nothing at all. To the genuinely philosophic mind, however, they still have existence, though not the same existence, as the real things. *As* objects of fancy, *as* errors, *as* occupants of dreamland, etc., they are in their way as indefeasible parts of life, as undeniable features of the Universe, as the realities are in their way. The total world of which the philosophers must take account is thus composed of the realities *plus* the fancies and illusions.

Two sub-universes, at least, connected by relations which philosophy tries to ascertain! Really there are more than two sub-universes of which we take account, some of us of this one, and others of that. For there are various categories both of illusion and of reality, and alongside of the world of

moment when it terminates, becoming a *practical* relation. But of this more anon. I only wish now to indicate the superficial nature of the distinction between the existential and the attributive proposition.

absolute error (i.e., error confined to single individuals) but still within the world of absolute reality (i.e., reality believed by the complete philosopher) there is the world of collective error, there are the worlds of abstract reality, of relative or practical reality, of ideal relations, and there is the supernatural world. The popular mind conceives of all these sub-worlds more or less discontentedly; and when dealing with one of them, forgets for the time being its relations to the rest. The complete philosopher is he who seeks not only to assign to every given object of his thought its right place in one or other of these sub-worlds, but he also seeks to determine the relation of each sub-world to the others in the total world which *is*.

The most important sub-universes commonly discriminated from each other and recognized by most of us as existing, each with its own special and separate style of existence, are the following:

(1) The world of sense, or of physical 'things' as we instinctively apprehend them, with such qualities as heat, color, and sound, and such 'forces' as life, chemical affinity, gravity, electricity, all existing as such within or on the surface of the things.

(2) The world of science, or of physical things as the learned conceive them, with secondary qualities and 'forces' (in the popular sense) excluded, and nothing real but solids and fluids and their 'laws' (i.e., customs) of motion.[8]

(3) The world of ideal relations, or abstract truths believed or believable by all, and expressed in logical, mathematical, metaphysical, ethical, or aesthetic propositions.

(4) The world of 'idols of the tribe', illusions or prejudices common to the race. All educated people recognize these as forming one sub-universe. The motion of the sky round the earth, for example, belongs to this world. That motion is not a recognized item of any of the other worlds; but as an 'idol of the tribe' it really exists. For certain philosophers 'matter' exists only as an idol of the tribe. For science, the 'secondary qualities' of matter are but 'idols of the tribe'.

(5) The various supernatural worlds, the Christian heaven and hell, the world of the Hindoo mythology, the world of Swedenborg's *visa et audita*, etc. Each of these is a consistent system, with definite relations among its own parts. Neptune's trident, e.g., has no status of reality whatever in the Christian heaven; but within the classic Olympus certain definite things are true of it, whether one believe in the reality of the classic mythology as a whole or not. The various worlds of deliberate fable may be ranked with these worlds of faith – the world of the *Iliad*, that of *King Lear*, of the *Pickwick Pacers*, etc.[9]

[8] I define the scientific universe here in the radical mechanical way. Practically, it is oftener thought of in a mongrel way and resembles in more points the popular physical world.

[9] It thus comes about that we can say such things as that Ivanhoe did not *really* marry Rebecca, as Thackeray *falsely* makes him do. The real Ivanhoe-world is the one in which

(6) The various worlds of individual opinion, as numerous as men are.

(7) The worlds of sheer madness and vagary, also indefinitely numerous.

Every object we think of gets at last referred to one world or another of this or of some similar list. It settles into our belief as a common-sense object, a scientific object, an abstract object, a mythological object, an object of some one's mistaken conception, or a madman's object; and it reaches this state sometimes immediately, but often only after being hustled and bandied about amongst other objects until it finds some which will tolerate its presence and stand in relations to it which nothing contradicts. The molecules and ether-waves of the scientific world, for example, simply kick the object's warmth and color out, they refuse to have any relations with them. But the world of 'idols of the tribe' stands ready to take them in. Just so the world of classic myth takes up the winged horse; the world of individual hallucination, the vision of the candle; the world of abstract truth, the proposition that justice is kingly, though no actual king be just. The various worlds themselves, however, appear (as aforesaid) to most men's minds in no very definitely conceived relation to each other, and our attention, when it turns to one, is apt to drop the others for the time being out of its account. Propositions concerning the different worlds are made from 'different points of view'; and in this more or less chaotic state the consciousness of most thinkers remains to the end. Each world *whilst it is attended to* is real after its own fashion; only the reality lapses with the attention.

THE WORLD OF 'PRACTICAL REALITIES'

Each thinker, however, has dominant habits of attention; and these *practically elect from among the various worlds some one to be for him the world of ultimate realities*. From this world's objects he does not appeal. Whatever positively contradicts them must get into another world or die. The horse, e.g., may have wings to its heart's content, so long as it does not pretend to be the real world's horse – *that* horse is absolutely wingless. For most men, as we shall immediately see, the 'things of sense' hold this prerogative position, and are the absolutely real world's nucleus. Other things, to be sure, may be real for this man or for that – things of science, abstract moral relations, things of the Christian theology, or what not. But even for the special man, these things are usually real with a less real reality than that of the things of sense. They are taken

Scott wrote down for us. *In that world* Ivanhoe does *not* marry Rebecca. The objects within that world are knit together by perfectly definite relations, which can be affirmed or denied. Whilst absorbed in the novel, we turn our backs on all other worlds, and, for the time, the Ivanhoe-world remains our absolute reality. When we wake from the spell, however, we find a still more real world, which reduces Ivanhoe, and all things connected with him, to the fictive status, and relegates them to one of the sub-universes grouped under No. 5.

less seriously; and the very utmost that can be said for anyone's belief in them is that it is as strong as his 'belief in his own senses'.[10]

In all this the everlasting partiality of our nature shows itself, our inveterate propensity to choice. For, in the strict and ultimate sense of the word existence, everything which can be thought of at all exists as *some* sort of object, whether mythical object, individual thinker's object, or object in outer space and for intelligence at large. Errors, fictions, tribal beliefs, are parts of the whole great Universe which God has made, and He must have meant all these things to be in it, each in its respective place. But for us finite creatures, "'tis to consider too curiously to consider so." The mere fact of appearing as an object at all is not enough to constitute reality. That may be metaphysical reality, reality for God; but what we need is practical reality, reality for ourselves; and, to have that, an object must not only appear, but it must appear both *interesting* and *important*. The worlds whose objects are neither interesting nor important we treat simply negatively, we brand them as *un*real.

In the relative sense, then, the sense in which we contrast reality with simple unreality, and in which one thing is said to have *more* reality than another, and to be more believed, *reality means simply relation to our emotional and active life*. This is the only sense which the word ever has in the mouths of practical men. *In this sense, whatever excites and stimulates our interest is real*; whenever an object so appeals to us that we turn to it, accept it, fill our mind with it, or practically take account of it, so far it is real for us, and we believe it. Whenever, on the contrary, we ignore it, fail to consider it or act upon it, despise it, reject it, forget it, so far it is unreal for us and disbelieved. Hume's account of the matter was then essentially correct, when he said that belief in anything was simply the having the idea of it in a lively and active manner:

[10] The world of dreams is our real world whilst we are sleeping, because our attention then lapses from the sensible world. Conversely, when we wake the attention usually lapses from the dream-world and that becomes unreal. But if a dream haunts us and compels our attention during the day it is very apt to remain figuring in our consciousness as a sort of sub-universe alongside of the waking world. Most people have probably had dreams which it is hard to imagine not to have been glimpses into an actually existing region of being, perhaps a corner of the 'spiritual world'. And dreams have accordingly in all ages been regarded as revelations, and have played a large part in furnishing forth mythologies and creating themes for faith to lay hold upon. The 'larger universe', here, which helps us to believe both in the dream and in the waking reality which is its immediate reductive, is the *total* universe, of Nature *plus* the Super-natural. The dream holds true, namely, in one half of that universe; the waking perceptions in the other half. Even to-day dream-objects figure among the realities in which some 'psychic-researchers' are seeking to rouse our belief. All our theories, not only those about the supernatural, but our philosophic and scientific theories as well, are like our dreams in rousing such different degrees of belief in different minds.

> "I say, then, that belief is nothing but a more vivid, lively, forcible, firm, steady conception of an object than the imagination alone is ever able to attain. ... It consists not in the peculiar nature or order of the ideas, but in the *manner* of their conception and in their *feeling* to the mind. I confess, that it is impossible perfectly to explain this feeling or manner of conception.... Its true and proper name ... is *belief*; which is a term, that everyone sufficiently understands in common life. And in philosophy, we can go no farther than assert, that *belief* is something felt by the mind, which distinguishes the idea of the judgment from the fictions of the imagination.[11] It gives them more weight and influence; makes them appear of greater importance; enforces them in the mind; gives them a superior influence on the passions, and renders them the governing principle of our actions."[12]

Or as Prof. Bain puts it: "In its essential character, belief is a phase of our active nature – otherwise called the Will."[13]

The object of belief, then, reality or real existence, in something quite different from all the other predicates which a subject may possess. Those are properties intellectually or sensibly intuited. When we add any one of them to the subject, we increase the intrinsic content of the latter, we enrich its picture in our mind. But adding reality does not enrich the picture in any such inward way; it leaves it inwardly as it finds it, and only fixes it and stamps it in to *us*.

> "The real," as Kant says, "contains no more than the possible. A hundred real dollars do not contain a penny more than a hundred possible dollars.... By whatever, and by however many, predicates I may think a thing, nothing is added to it if I add that the thing exists. ... Whatever, therefore, our concept of an object may contain, we must always step outside of it, in order to attribute to it existence."[14]

The 'stepping outside' of it is the establishment either of immediate practical relations between it and ourselves, or of relations between it and other objects with which we have immediate practical relations. Relations of this sort, which are as yet not transcended or superseded by others, are *ipso facto* real relations,

[11] Distinguishes realities from unrealities. the essential from the rubbishy and neglectable.

[12] *Inquiry Concerning Human Understanding*, sec. v, pt. 2 (slightly transposed in my quotation).

[13] Note to James Mill's *Analysis*, I. 394.

[14] *Critique of Pure Reason*, trans. Müller, II, 515–16. Hume also: "When, after the simple conception of any thing we would conceive it as existent, we in reality make no addition to, or alteration of, our first idea. Thus when we affirm, that God is existent, we simply form the idea of such a being as he is represented to us; nor is the existence, which we

and confer reality upon their objective term. *The fons et origo of all reality, whether from the absolute or the practical point of view, is thus subjective, is ourselves*. As bare logical thinkers, without emotional reaction, we give reality to whatever objects we think of, for they are really phenomena, or objects of our pausing thought, if nothing more. But, *as thinkers with emotional reaction, we give what seems to be a still higher degree of reality to whatever things we select and emphasize and turn to* WITH A WILL. These are our *living* realities; and not only these, but all the other things which are intimately connected with these. Reality, starting from our Ego, thus sheds itself from point to point – first, upon all objects which have an immediate sting of interest for our Ego in them, and next, upon the objects most continuously related with these. It only fails when the connecting thread is lost. A whole system may be real, if it only hang to our Ego by one immediately *stinging* term. But what contradicts any such stinging term, even though it be another stinging term itself, is either not believed, or only believed after settlement of the dispute.

We reach thus the important conclusion that *our own reality, that sense of our own, life which we at every moment possess, is the ultimate of ultimates for our belief*. 'As sure as I exist!' – this is our uttermost warrant for the being of all other things. As Descartes made the indubitable reality of the *cogito* go bail for the reality of all that the cogito involved, so we all of us, feeling our own present reality with absolutely coercive force, ascribe an all but equal degree of reality, first to whatever things we lay hold on with a sense of personal need, and second, to whatever farther things continuously belong with these. "Mein Jetzt und Hier," as Prof. Lipps says, "ist der letzte Angelpunkt für alle Wirklichkeit, also alle Erkenntniss."

The world of living realities as contrasted with unrealities is thus anchored in the Ego, considered as an active and emotional term.[15] That is the hook from which the rest dangles, the absolute support. And as from a painted hook it has been said that one can only hang a painted chain, so conversely, from a real hook only a real chain can properly be hung. *Whatever things have intimate and continuous connection with my life are things of whose reality I cannot doubt*. Whatever things fail to establish this connection are things which are practically no better for me than if they existed not at all.

> attribute to him, conceived by a particular idea, which we join to his other qualities, and can again separate and distinguish from them.... The belief of the existence joins no new idea to those, which compose the ideas of the object. When I think of God, when I think of Him as existent, and when I believe him to be existent, my idea of him neither increases nor diminishes. But as 'tis certain there is a great difference betwixt the simple conception of the existence of an object, and the belief of it, and as this difference lies not in the facts or compositions of the idea, which we conceive; it follows, that it must lie in the *manner*, in which we conceive it." (*Treatise of Human Nature*, pt. 3, sec. 7.)

[15] I use the notion of the Ego here, as common-sense uses it. Nothing is prejudged as to the results (or absence of results) of ulterior attempts to analyze the notion.

In certain forms of melancholic perversion of the sensibilities and reactive powers, nothing touches us intimately, rouses us, or wakens natural feeling. The consequence is the complaint so often heard from melancholic patients, that nothing is believed in by them as it used to be, and that all sense of reality is fled from life. They are sheathed in india-rubber; nothing penetrates to the quick or draws blood, as it were. According to Griesinger, "I see, I hear!" such patients say, "but the objects do not reach me, it is as if there were a wall between me and the outer world!"

> "In such patients there often is an alteration of the cutaneous sensibility, such that things feel indistinct or sometimes rough and woolly. But even were this change always present, it would not completely explain the psychic phenomenon ... which reminds us more of the alteration in our psychic relations to the outer world which advancing age on the one hand, and on the other emotions and passions, may bring about. In childhood we feel ourselves to be closer to the world of sensible phenomena, we lire immediately with them and in them; an intimately vital tie binds us and them together. But with the ripening of reflection this tie is loosened, the warmth of our interest cools, things look differently to us, and we act more as foreigners to the outer world, even though we know it a great deal better. Joy and expansive emotions in general draw it nearer to us again. Everything makes a more lively impression, and with the quick immediate return of this warm receptivity for sense-impressions, joy makes us feel young again. In depressing emotions it is the other way. Outer things, whether living or inorganic, suddenly grow cold and foreign to us, and even our favorite objects of interest feel as if they belonged to us no more. Under these circumstances, receiving no longer from anything a lively impression, we cease to turn towards outer things, and the sense of inward loneliness grows upon us. ... Where there is no strong intelligence to control this *blasé* condition, this psychic coldness and lack of interest, the issue of these states in which all seems so cold and hollow, the heart dried up, the world grown dead and empty, is often suicide or the deeper forms of insanity.[16]

THE PARAMOUNT REALITY OF SENSATIONS

But now we are met by questions of detail. What does this stirring, this exciting power, this interest, consist in, which some objects have? which are

[16] Griesinger, *Die Pathologie und Therapie der psychischen Krankheiten*, §§50, 98. See also Lotze: *Medicinische Psychologie*, p. 251. The neologism we so often hear, that an experience 'gives us a *realizing sense*' of the truth of some proposition or other, illustrates the dependence of the sense of reality upon *excitement*. Only what stirs us is 'realized'.

those 'intimate relations' with our life which give reality? And what things stand in these relations immediately, and what others are so closely connected with the former that (in Hume's language) we 'carry our disposition' also on to them?

In a simple and direct way these questions cannot be answered at all. The whole history of human thought is but an unfinished attempt to answer them. For what have men been trying to find out, since men were men, but just those things: "Where do our true interests lie – which relations shall we call the intimate and real ones – which things shall we call living realities and which not?" A few psychological points can, however, be made clear.

Any relation to our mind at all, in the absence of a stronger relation, suffices to make an object real. The barest appeal to our attention is enough for that. Revert to the beginning of the chapter, and take the candle entering the vacant mind. The mind was waiting for just some such object to make its spring upon. It makes its spring and the candle is believed. But when the candle appears at the same time with other objects, it must run the gauntlet of their rivalry, and then it becomes a question which of the various candidates for attention shall compel belief. As a rule we believe as much as we can. We would believe everything if we only could. When objects are represented by us quite unsystematically they conflict but little with each other, and the number of them which in this chaotic manner we can believe is limitless. The primitive savage's mind is a jungle in which hallucinations, dreams, superstitions, conceptions, and sensible objects all flourish alongside of each other, unregulated except by the attention turning in this way or in that. The child's mind is the same. It is only as objects become permanent and their relations fixed that discrepancies and contradictions are felt and must be settled in some stable way. As a rule, the success with which a contradicted object maintains itself in our belief is proportional to several qualities which it must possess. Of these the one which would be put first by most people, because it characterizes objects of sensation, is its –

(1) Coerciveness over attention, or the mere power to possess consciousness: then follow –

(2) Liveliness, or sensible pungency, especially in the way of exciting pleasure or pain;

(3) Stimulating effect upon the will, i.e., capacity to arouse active impulses, the more instinctive the better;

(4) Emotional interest, as object of love, dread, admiration, desire, etc.;

(5) Congruity with certain favorite forms of contemplation – unity, simplicity, permanence, and the like;

(6) Independence of other causes, and its own causal importance.

These characters run into each other. Coerciveness is the result of liveliness or emotional interest. What is lively and interesting stimulates *eo ipso* the will; congruity holds of active impulses as well as of contemplative forms; causal

independence and importance suit a certain contemplative demand, etc. I will therefore abandon all attempt at a formal treatment, and simply proceed to make remarks in the most convenient order of exposition.

As a whole, sensations are more lively and are judged more real than conceptions; things met with every hour more real than things seen once; attributes perceived when awake, more real than attributes perceived in a dream. But, *owing to the diverse relations contracted by the various objects with each other*, the simple rule that the lively and permanent is the real is often enough disguised. A conceived thing may be deemed more real than a certain sensible thing, if it only be intimately related to other sensible things more vivid, permanent, or interesting than the first one. Conceived molecular vibrations, e.g., are by the physicist judged more real than felt warmth, because so intimately related to all those other facts of motion in the world which he has made his special study. Similarly, a rare thing may be deemed more real than a permanent thing if it be more widely related to other permanent things. All the occasional crucial observations of science are examples of this. A rare experience, too, is likely to be judged more real than a permanent one, if it be more interesting and exciting. Such is the sight of Saturn through a telescope; such are the occasional insights and illuminations which upset our habitual ways of thought.

But no mere floating conception, no mere disconnected rarity, ever displaces vivid things or permanent things from our belief. A conception, to prevail, must *terminate* in the world of orderly sensible experience. A rare phenomenon, to displace frequent ones, must belong with others more frequent still. The history of science is strewn with wrecks and ruins of theory – essences and principles, fluids and forces – once fondly clung to, but found to hang together with no facts of sense. And exceptional phenomena solicit our belief in vain until such time as we chance to conceive them as of kinds already admitted to exist. What science means by 'verification' is no more than this, that no object of conception shall be believed which sooner or later has not some permanent and vivid object of sensation for its *term*. Compare what was said on pages 653–657 [insert correct pages], above.

Sensible objects are thus either our realities or the tests of our realities. Conceived objects must show sensible effects or else be disbelieved. And the effects, even though reduced to relative unreality when their causes come to view (as heat, which molecular vibrations make unreal), are yet the things on which our knowledge of the causes rests. Strange mutual dependence this, in which the appearance needs the reality in order to exist, but the reality needs the appearance in order to be known!

Sensible vividness or pungency is then the vital factor in reality when once the conflict between objects, and the connecting of them together in the mind, has begun. No object which neither possesses this vividness in its own right nor is able to borrow it from anything else has a chance of making

headway against vivid rivals, or of rousing in us that reaction in which belief consists. On the vivid objects we *pin*, as the saying is, our faith in all the rest; and our belief returns instinctively even to those of them from which reflection has led it away. Witness the obduracy with which the popular world of colors, sounds, and smells holds its own against that of molecules and vibrations. Let the physicist himself but nod, like Homer, and the world of sense becomes his absolute reality again.[17]

That things originally devoid of this stimulating power should be enabled, by association with other things which have it, to compel our belief as if they had it themselves, is a remarkable psychological fact, which since Hume's time it has been impossible to overlook.

> "The vividness of the first conception," he writes, "diffuses itself along the relations and is convey'd, as by so many pipes or channels, to every idea that has any communication with the primary one.... Superstitious people are fond of the relicks of saints and holy men, for the same reason that they seek after types and images, in order to inliven their devotion and give them a more intimate and strong conception of those exemplary lives. ... Now, 'tis evident one of the best relicks a devotee cou'd procure wou'd be the handiwork of a saint, and if his clothes and furniture are ever to be consider'd in this light, 'tis because they were once at his disposal, and were mov'd and affected by him; in which respect they are ... connected with him by a shorter train of consequences than any of those from which we learn the reality of his existence. This phenomenon clearly proves that a present impression, with a relation of causation, may enliven any idea, and consequently produce belief or assent, according to the precedent definition of it. ... It has been remark'd among the

[17] The way in which sensations are pitted against systematized conceptions, and in which the one or the other then prevails according as the sensations are felt by ourselves or merely known by report, is interestingly illustrated at the present day by the state of public belief about 'spiritualistic' phenomena. There exist numerous narratives of movement without contact on the part of articles of furniture and other material objects, in the presence of certain privileged individuals called mediums. Such movement violates our memories, and the whole system of accepted physical 'science'. Consequently those who have not seen it either brand the narratives immediately as lies or call the phenomena 'illusions' of sense, produced by fraud or due to hallucination. But one who has actually seen such a phenomenon, under what seems to him sufficiently 'test-conditions', will hold to his sensible experience through thick and thin, even though the whole fabric of 'science' should be rent in twain. That man would be a weak-spirited creature indeed who should allow any-blown generalities about 'the liability of the senses to be deceived' to bully him out of his adhesion to what for him was an indubitable experience of sight. A man may err in this obstinacy, sure enough, in any particular case. But the spirit that animates him is that on which ultimately the very life and health of Science rest.

> *Mahometans* as well as *Christians* that those *pilgrims* who have seen Mecca or the Holy Land, are ever after more faithful and zealous believers, than those who have not had that advantage. A man, whose memory presents him with a lively image of the *Red Sea and the Desert and Jerusalem and Galilee* can never doubt of any miraculous events which are related either by *Moses or the Evangelists*. The lively idea of the places passes by an easy transition to the facts which are suppos'd to have been related to them by contiguity, and increases the belief by increasing the vivacity of the conception. The remembrance of those fields and rivers has the same influence as a new argument.... The ceremonies of the *Catholic* religion may be consider'd as instances of the same nature. The devotees of that strange superstition usually plead in excuse for the mummeries, with which they are upbraided, that they feel the good effect of external motions, and postures, and actions, in enlivening their devotion and quickening their fervor, which otherwise wou'd decay away, if directed entirely to distant and immaterial objects. We shadow out the objects of our faith, say they, in sensible types and images, and render them more present to us by the immediate presence of these types than 'tis possible for us to do, merely by an intellectual view and contemplation."[18]

Hume's cases are rather trivial; and the things which associated sensible objects make us believe in are supposed by him to be unreal. But all the more manifest for that is the fact of their psychological influence. Who does not 'realize' more the fact of a dead or distant friend's existence, at the moment when a portrait, letter, garment or other material reminder of him is found? The whole notion of him then grows pungent and speaks to us and shakes us, in a manner unknown at other times. In children's minds, fancies and realities live side by side. But however lively their fancies may be, they still gain help from association with reality. The imaginative child identifies its *dramatis personae* with some doll or other material object, and this evidently solidifies belief, little as it may resemble what it is held to stand for. A thing not too interesting by its own real qualities generally does the best service here. The most useful doll I ever saw was a large cucumber in the hands of a little Amazonian-Indian girl; she nursed it and washed it and rocked it to sleep in a hammock, and talked to it all day long – there was no part in life which the cucumber did not play. Says Mr. Tylor:

> "An imaginative child will make a dog do duty for a horse, or a soldier for a shepherd, till at last the objective resemblance almost disappears,

[18] *Treatise of Human Nature*, bk. I. pt. III, sec. 8.

> and a bit of wood may be dragged about, resembling a ship on the sea or a coach on the road. Here the likeness of the bit of wood to a ship or coach is very slight indeed; but it is a thing, and can be moved about ... and is an evident assistance to the child in enabling it to arrange and develop its ideas.... Of how much use ... may be seen by taking it away, and leaving the child nothing to play with. ... In later years and among highly educated people the mental process which goes on in a child's playing with wooden soldiers and horses, though it never disappears, must be sought for in more complex phenomena. Perhaps nothing in after-life more closely resembles the effect of a doll upon a child than the effect of the illustrations of a tale upon a grown reader. Here the objective resemblance is very indefinite ... yet what reality is given to the scene by a good picture. ... Mr. Backhouse one day noticed in Van Diemen's Land a woman arranging several stones that were flat, oval, and about, two inches wide, and marked in various directions with black and red lines. These, he learned, represented absent friends, and one larger than the rest stood for a fat native woman on Flinder's Island, known by the name of Mother Brown. Similar practices are found among far higher races than the ill-fated Tasmanians. Among some North American tribes another who has lost a child keeps its memory ever present to her by filling its cradle with black feathers and quills, and carrying it about with her for a year or more. When she stops anywhere, she sets up the cradle and talks to it as she goes about her work, just as she would have done if the dead body had been still alive within it. Here we have an image; but in Africa we find a rude doll representing the child, kept as a memorial. ... Bastian saw Indian women in Peru who had lost an infant carrying about on their backs a wooden doll to represent it."[19]

To many persons among us, photographs of lost ones seem to be fetishes. They, it is true, resemble; but the fact that the mere materiality of the reminder is almost as important as its resemblance is shown by the popularity a hundred years ago of the black taffeta 'silhouettes' which are still found among family relics, and of one of which Fichte could write to his affianced: "*Die Farbe fehlt, das Auge fehlt, es fehlt der himmlische Ausdruck deiner lieblichen Züge*" – and yet go on worshiping it all the same. The opinion so stoutly professed by many, that language is essential to thought, seems to have this much of truth in it, that all our inward images tend invincibly to attach themselves to something sensible, so as to gain in corporeity and life. Words serve this purpose, gestures serve it, stones, straws, chalk-marks, anything will do. As soon as anyone of these things stands for the idea, the latter seems to be more real. Some persons, the present writer among the number, can

[19] *Researches into the Early History of Mankind*, p. 108.

hardly lecture without a black-board: the abstract conceptions must be symbolized by letters, squares or circles, and the relations between them by lines. All this symbolism, linguistic, graphic, and dramatic, has other uses too, for it abridges thought and fixes terms. But one of its uses is surely to rouse the believing reaction and give to the ideas a more living reality. As, when we are told a story, and shown the very knife that did the murder, the very ring whose hiding-place the clairvoyant revealed, the whole thing passes from fairy-land to mother-earth, so here we believe all the more, if only we see that 'the bricks are alive to tell the tale'.

So much for the prerogative position of sensations in regard to our belief. But among the sensations themselves all are not deemed equally real. The more practically important ones, the more permanent ones, and the more aesthetically apprehensible ones are selected from the mass, to be believed in most of all; the others are degraded to the position of mere signs and suggestions of these. This fact has already been adverted to in former chapters.[20] The real color of a thing is that one color-sensation which it gives us when most favorably lighted for vision. Soon its real size, its real shape, etc. – these are but optical sensations selected out of thousands of others, because they have aesthetic characteristics which appeal to our convenience or delight. But I will not repeat what I have already written about this matter, but pass on to our treatment of tactile and muscular sensations, as 'primary qualities', more real than those 'secondary' qualities which eye and ear and nose reveal. Why do we thus so markedly select the *tangible* to be the real? Our motives are not far to seek. The tangible qualities are the least fluctuating. When we get them at all we get them the same. The other qualities fluctuate enormously as our relative position to the object changes. Then, more decisive still, the tactile properties are those most intimately connected with our weal or woe. A dagger hurts us only when in contact with our skin, a poison only when we take it into our mouths, and we can only use an object for our advantage when we have it in our muscular control. It is as tangibles, then, that things concern us most; and the other senses, so far as their practical use goes, do but warn us of what tangible things to expect. They are but organs of anticipatory touch, as Aristotle and Berkeley has with perfect clearness explained.[21]

Among all sensations, the *most* belief-compelling are those productive of pleasure or of pain. Locke expressly makes the *pleasure-* or *pain*-giving quality to be the ultimate human criterion of anything's reality. Discussing (with supposed Berkeleyan before Berkeley) the notion that all our perceptions may be but a dream, he says:

[20] See Vol. I, pp. 285–8; Vol. II, pp. 237 ff.

[21] See *An Essay towards a New Theory of Vision*, §59.

> "He may please to dream that I make him this answer ... that I believe he will allow a very manifest difference between dreaming of being in the fire and being actually in it. But yet if he be resolved to appear so skeptical as to maintain, that what I call 'being actually in the fire' is nothing but a dream; and that we cannot thereby certainly know that any such thing as fire actually exists without us: I answer, that we certainly finding that pleasure or pain [or emotion of any sort] follows upon the application of certain objects to us, whose existence we perceive, or dream that we perceive by our senses, *this certainly is as great as our happiness or misery*, beyond which we have no concernment to know or to be."[22]

THE INFLUENCE OF EMOTION AND ACTIVE IMPULSE ON BELIEF

The quality of arousing emotion, of shaking, moving us or inciting us to action, has as much to do with our belief in an object's reality as the quality of giving pleasure or pain. In Chapter XXV I shall seek to show that our emotions probably owe their pungent quality to the bodily sensations which they involve. Our tendency to believe in emotionally exciting objects (objects of fear, desire, etc.) is thus explained without resorting to any fundamentally new principle of choice. Speaking generally, the more a conceived object *excites* us, the more reality it has. The same object excites us differently at different times. Moral and religious truths come 'home' to us far more on some occasions than on others. As Emerson says, "There is a difference between one and another hour of life in their authority and subsequent effect. Our faith comes in moments.... Yet there is a depth in those brief moments which constrains us to ascribe more reality to them than to all other experiences." The 'depth' is partly, no doubt, the insight into wider systems of unified relation, but far more often than that it is the emotional thrill. Thus, to descend to more trivial examples, a man who has no belief in ghosts by

[22] *Essay*, bk. IV, chap. 2, §14. In another place: "He that sees a candle burning and hath experimented the force of its flame by putting his finger into it, will little doubt that this is something existing without him, which does him harm and puts him to great pain. ... And if our dreamer pleases to try whether the glowing heat of a glass furnace be barely a wandering imagination in a drowsy man's fancy by putting his hand into it, he may, perhaps, be awakened into a certainty, greater than he could wish, that it is something more than bare imagination. So that the evidence is as great as we can desire, being as certain to us as our pleasure or pain, i.e. happiness or misery; beyond which we have no concernment, either of knowing or being. Such an assurance of the existence of things without us is sufficient to direct us in the attaining the good and avoiding the evil which is caused by them, which is the important concernment we have of being made acquainted with them." (*Ibid.*, bk. IV, chap. 11, §8.)

daylight will temporarily believe in them when, alone at midnight, he feels his blood curdle at a mysterious sound or vision, his heart thumping, and his legs impelled to flee. The thought of falling when we walk along a curbstone awakens no emotion of dread; so no sense of reality attaches to it, and we are sure we shall not fall. On a precipice's edge, however, the sickening emotion which the notion of a possible fall engenders makes us believe in the latter's imminent reality, and quite unfits us to proceed.

The greatest proof that a man is *sui compos* is his ability to suspend belief in presence of an emotionally exciting idea. To give this power is the highest result of education. In untutored minds the power does not exist. *Every exciting thought in the natural man carries credence with it. To conceive with passion is eo ipso to affirm.* As Bagehot says:

> "The Caliph Omar ... burnt the Alexandrian Library, saying: 'All books which contain what is not in the Koran are dangerous; all those which contain what is in it are useless!' Probably no one ever had an intenser belief in anything than Omar had in this. Yet it is impossible to imagine it preceded by an argument. His belief in Mahomet, in the Koran, and in the sufficiency of the Koran, probably came to him in spontaneous rushes of emotion; there may have been little vestiges of argument floating here and there, but they did not justify the strength of the emotion, still less did they create it, and they hardly even excused it. ... Probably, when the subject is thoroughly examined, 'conviction' will be proved to be one of the intensest of human emotions, and one most closely connected with the bodily state ... accompanied or preceded by the sensation that Scott makes his seer describe as the prelude of a prophecy: –
>
> 'At length the fatal answer came,
> In characters of living flame –
> Not spoke in words, nor blazed in scroll,
> But borne and branded on my soul'.
>
> A hot flash seems to burn across the brain. Men in these intense states of mind have altered all history, changed for better or worse the creed of myriads, and desolated or redeemed provinces or ages. Nor is this intensity a sign of truth, for it is precisely strongest in those points in which men differ most from each other. John Knox felt it in his anti-Catholicism; Ignatius Loyola in his anti-Protestantism; and both, I suppose, felt it as much as it is possible to feel it."[23]

The reason of the belief is undoubtedly the bodily commotion which the exciting idea sets up. 'Nothing which I can feel like *that* can be false'. All our

[23] W. Bagehot: "The Emotion of Conviction," *Literary Studies*, II, 412–14.

religious and supernatural beliefs are of this order. The surest warrant for immortality is the yearning of our bowels for our dear ones; for God, the sinking sense it gives us to imagine no such Providence or help. So of our political or pecuniary hopes and fears, and things and persons dreaded and desired. "A grocer has a full creed as to foreign policy, a young lady a complete theory of the sacraments, as to which neither has any doubt. ... A girl in a country parsonage will be sure 'that Paris never can be taken', or that 'Bismarck is a wretch'," – all because they have either conceived these things at some moment with passion, or associated them with other things which they have conceived with passion.

M. Renouvier calls this belief of a thing for no other reason than that we conceive it with passion, by the name of *mental vertigo*.[24] Other objects whisper doubt or disbelief; but the object of passion makes us deaf to all but itself, and we affirm it unhesitatingly. Such objects are the delusions of insanity, which the insane person can at odd moments steady himself against, but which again return to sweep him off his feet. Such are the revelations of mysticism. Such, particularly, are the sudden beliefs which animate mobs of men when frenzied impulse to action is involved. Whatever be the action in point – whether the stoning of a prophet, the hailing of a conqueror, the burning of a witch, the baiting of a heretic or Jew, the starting of a forlorn hope, or the flying from a foe – the fact that to believe a certain object will *cause that action to explode* is a sufficient reason for that belief to come. The motor impulse sweeps it unresisting in its train.

The whole history of witchcraft and early medicine is a commentary on the facility with which anything which chances to be conceived is believed the moment the belief chimes in with an emotional mood. 'The cause of sickness?' When a savage asks the cause of anything he means to ask exclusively 'What is to blame?' The theoretic curiosity starts from the practical life's demands. Let some one then accuse a necromancer, suggest a charm or spell which has been cast, and no more 'evidence' is asked for. What evidence is required beyond this intimate sense of the culprit's responsibility, to which our very viscera and limbs reply?[25]

[24] *Psychologie rationnelle*, ch. 12.

[25] Two examples out of a thousand:
Reid: *Inquiry*, ch. II, §9: "I remember, many years ago, a white ox was brought into the country, of so enormous a size that people came many miles to see him. There happened, some months after, an uncommon fatality among women in child-bearing. Two such uncommon events, following one another, gave a suspicion of their connection, and occasioned a common opinion among the country people that the white ox was the cause of this fatality."

H. M. Stanley: *Through the Dark Continent*, II, 384: "On the third day of our stay at Mowa, feeling quite comfortable amongst the people, on account of their friendly

Human credulity in the way of therapeutics has similar psychological roots. If there is anything intolerable (especially to the heart of a woman), it is to do nothing when a loved one is sick or in pain. To do anything is a relief. Accordingly, whatever remedy may be suggested is a spark on inflammable

bearing, I began to write in my note-book the terms for articles, in order to improve my already copious vocabulary of native words. I had proceeded only a few minutes when I observed a strange commotion amongst the people who had been flocking about me, and presently they ran away. In a short time we heard war-cries ringing loudly and shrilly over the table-land. Two hours afterwards, a long line of warriors were seen descending the table-land and advancing towards our camp. There may have been between five and six hundred of them. We, on the other hand, had made but few preparations except such as would justify us replying to them in the event of the actual commencement of hostilities. But I had made many firm friends amongst them, and I firmly believed that I should be able to avert an open rupture. When they had assembled at about a hundred yards in front of our camp, Safeni and I walked up towards them, and sat down midway. Some half-dozen of the Mowa people came near, and the shauri began.

"'What is the matter, my friends?' I asked. 'Why do you come with guns in your hands in such numbers, as though you were coming to fight? Fight? Fight us, your friends! Tut! this is some great mistake, surely.'

"'Mundelé' replied one of them, ... 'our people saw you yesterday make marks on some tara-tara (paper). This is very bad. Our country will waste, our goats will die, our bananas will rot, and our women will dry up. What have we done to you that you should wish to kill us? We have sold you food, and we have brought you wine, each day. Your people are allowed to wander where they please, without trouble. Why is the Mundelé so wicked! We have gathered together to fight you if you do not burn that tara-tara now before our eyes. If you burn it we go away, and shall be your friends as heretofore'.

"I told them to rest there, and left Safeni in their hands as a pledge that I should return. My tent was not fifty yards from the spot, but while going towards it my brain was busy in devising some plan to foil this superstitious madness. My note-book contained a vast number of valuable notes.... I could not sacrifice it to the childish caprice of savages. As I was rummaging my book-box, I came across a volume of Shakespeare (Chandos edition), much worn and well thumbed, and which was of the same size as my field-book; its cover was similar also, and it might be passed for the field-book, provided that no one remembered its appearance too well. I took it to them. 'Is this the tara-tara, friends, that you wish burnt?'

"'Yes, yes, that is it.'

"'Well, take it, and burn it. or keep it.'

"'M–m. No, no, no. We will not touch it. It is fetish. You must burn it.'

"'I! Well, let it be so. I will do anything to please my good friends of Mowa.'

"We walked to the nearest fire. I breathed a regretful farewell to my genial companion, which during many weary hours of night, had assisted to relieve my mind when oppressed by almost intolerable woes, and then gravely consigned the innocent Shakespeare to the flames, heaping the brush-fuel over it with ceremonious care.

"'Ah-h-h,' breathed the poor deluded natives sighing their relief.... 'There is no trouble now.' ... And something approaching to a cheer was shouted among them, which terminated the episode of the Burning of Shakespeare."

soil. The mind makes its spring towards action on that cue, sends for that remedy, and for a day at least believes the danger past. Blame, dread, and hope are thus the great belief-inspiring passions, and cover among them the future, the present, and the past.

These remarks illustrate the earlier heads of the list on page 292 [insert correct page #]. Whichever represented objects give us sensations, especially interesting ones, or incite our motor impulses, or arouse our hate, desire, or fear, are real enough for us. Our requirements in the way of reality terminate in our own acts and emotions, our own pleasures and pains. These are the ultimate fixities from which, as we formerly observed, the whole chain of our beliefs depends, object hanging to object, as the bees, in swarming, hang to each other until, *de proche en proche*, the supporting branch, the Self, is reached and held.

BELIEF IN OBJECTS OF THEORY

Now the merely conceived or imagined objects which our mind represents as hanging to the sensations (causing them, etc.), filling the gaps between them, and weaving their interrupted chaos into order are innumerable. Whole systems of them conflict with other systems, and our choice of which system shall carry our belief is governed by principles which are simple enough, however subtle and difficult may be their application to details. *The conceived system, to pass for true, must at least include the reality of the sensible objects in it, by explaining them as effects on us, if nothing more. The system which includes the most of them, and definitely explains or pretends to explain the rest of them, will, ceteris paribus, prevail.* It is needless to say how far mankind still is from having excogitated such a system. But the various materialisms, idealisms, and hylozoisms show with what industry the attempt is forever made. It is conceivable that several rival theories should equally well include the actual order of our sensations in their scheme, much as the one-fluid and two-fluid theories of electricity formulated all the common electrical phenomena equally well. The sciences are full of these alternatives. Which theory is then to be believed? *That theory will be most generally believed which, besides offering us objects able to account satisfactorily for our sensible experience, also offers those which are most interesting, those which appeal most urgently to our aesthetic, emotional, and active needs.* So here, in the higher intellectual life, the same selection among general conceptions goes on which went on among the sensations themselves. First, a word of their relation to our emotional and active needs – and here I can do no better than quote from an article published some years ago:[26]

[26] "Rationality, Activity, and Faith" (*Princeton Review*, July 1882, pp. 64–9).

"A philosophy may be unimpeachable in other respects, but either of two defects will be fatal to its universal acceptance. First, its ultimate principle must not be one that essentially baffles and disappoints our dearest desires and most cherished powers. A pessimistic principle like Schopenhauer's incurably vicious Will-substance, or Hartmann's wicked jack-at-all-trades, the Unconscious, will perpetually call forth essays at other philosophies. Incompatibility of the future with their desires and active tendencies is, in fact, to most men a source of more fixed disquietude than uncertainty itself. Witness the attempts to overcome the 'problem of evil', the 'mystery of pain'. There is no 'problem of good'.

"But a second and worse defect in a philosophy than that of contradicting our active propensities is to give them no Object whatever to press against. A philosophy whose principle is so incommensurate with our most intimate powers as to deny them all relevancy in universal affairs, as to annihilate their motives at one blow, will be even more unpopular than pessimism. Better face the enemy than the eternal Void! This is why materialism will always fail of universal adoption, however well it may fuse things into an atomistic unity, however clearly it may prophesy the future eternity. For materialism denies reality to the objects of almost all the impulses which we most cherish. The real *meaning* of the impulses, it says, is something which has no emotional interest for us whatever. But what is called extradition is quite as characteristic of our emotions as of our sense. Both point to an Object as the cause of the present feeling. What an intensely objective reference lies in fear! In like manner an enraptured man, a dreary-feeling man, are not simply aware of their subjective states; if they were, the force of their feelings would evaporate. Both believe there is outward cause *why* they should feel as they do: either 'It is a glad world! how good is life!' or 'What a loathsome tedium is existence!' Any philosophy which annihilates the validity of the reference by explaining away its objects or translating them into terms of no emotional pertinency leaves the mind with little to care or act for. This is the opposite condition from that of nightmare, but when acutely brought home to consciousness it produces a kindred horror. In nightmare we have motives to act, hut no power: here we have powers, but no motives. A nameless *Unheimlichkeit* comes over us at the thought of there being nothing eternal in our final purposes, in the objects of those loves and aspirations which are our deepest energies. The monstrously lopsided equation of the universe and its knower, which we postulate as the ideal of cognition, is perfectly paralleled by the no less lopsided equation of the universe and the *doer*. We demand in it a *character* for which our emotions and active propensities shall be a match. Small as we are, minute as is the point by which the Cosmos impinges upon each one of us, each one desires to feel that his reaction at that point is congruous with the demands of the vast whole, that balances the latter, so to speak, and is able to do what it expects of him. But as his abilities

to 'do' lie wholly in the line of his natural propensities; as he enjoys reaction with such emotions as fortitude, hope, rapture, admiration, earnestness, and the like; and as he very unwillingly reacts with fear, disgust, despair, or doubt, – a philosophy which should legitimate only emotions of the latter sort would be sure to leave the mind a prey to discontent and craving.

"It is far too little recognized how entirely the intellect is built up of practical interests. The theory of Evolution is beginning to do very good service by its reduction of all mentality to the type of reflex action. Cognition, in this view, is but a fleeting moment, a cross-section at a certain point of what in its totality is a motor phenomenon. In the lower forms of life no one will pretend that cognition is anything more than a guide to appropriate action. The germinal question concerning things brought for the first time before consciousness is not the theoretic 'What is that?' but the practical 'Who goes there?' or rather, as Horwicz has admirably put it, 'What is to be done?' – '*Was fang' ich an?*' In all our discussions about the intelligence of lower animals the only test we use is that of their *acting* as if for a purpose. Cognition, in short, is incomplete until discharged in act. And although it is true that the later mental development, which attains its maximum through the hypertrophied cerebrum of man, gives birth to a vast amount of theoretic activity over and above that which is immediately ministerial to practice, yet the earlier claim is only postponed, not effaced, and the active nature asserts its rights to the end....

"If there be any truth at all in this view, it follows that however vaguely a philosopher may define the ultimate universal datum, he cannot be said to leave it unknown to us so long as he in the slightest degree pretends that our emotional or active attitude towards it should be of one sort rather than another. He who says, 'Life is real, life is earnest', however much he may speak of the fundamental mysteriousness of things, gives a distinct definition to that mysteriousness by ascribing to it the right to claim from us the particular mood called seriousness, which means the unwillingness to live with energy, though energy bring pain. The same is true of him who says that all is vanity. Indefinable as the predicate vanity may be *in se*, it is clearly enough something which permits anesthesia, mere escape from suffering, to be our rule of life. There is no more ludicrous incongruity than for agnostics to proclaim with one breath that the substance of things is unknowable, and with the next that the thought of it should inspire us with admiration of its glory, reverence, and a willingness to add our cooperative push in the direction towards which its manifestations seem to be drifting. The unknowable may be unfathomed, but if it make such distinct demands upon our activity, we surely are not ignorant of its essential quality.

"If we survey the field of history and ask what feature all great periods of revival, of expansion of the human mind, display in common, we shall find, I think, simply this: that each and all of them have said to the human

being, 'The inmost nature of the reality is congenial to *powers* which you possess.' In what did the emancipating message of primitive Christianity consist, but in the announcement that God recognizes those weak and tender impulses which pagrtnism had so rudely overlooked? Take repentance: the man who can do nothing rightly can at least repent of his failures. But for paganism this faculty of repentance was a pure supernumerary, a straggler too late for the fair. Christianity took it and made it the one power within us which appealed straight to the heart of God. And after the night of the Middle Ages had so long branded with obloquy even the generous impulses of the flesh, and defined the Reality to be such that only slavish natures could commune with it? in what did the *Sursum corda!* of the Renaissance lie but in the proclamation that the archetype of verity in things laid claim on the widest activity of our whole aesthetic being? What were Luther's mission and Wesley's but appeals to powers which even the meanest of men might carry with them, faith and self-despair, but which were personal, requiring no priestly intermediation, and which brought their owner face to face with God? What caused the wildfire influence of Rousseau but the assurance he gave that man's nature was in harmony with the nature of things, if only the paralyzing corruptions of custom would stand from between? How did Kant and Fichte, Goethe and Schiller, inspire their time with cheer, except by saying, 'Use all your powers; that is the only obedience which the universe exacts'? And Carlyle with his gospel of Work, of Fact, of Veracity, how does he move us except by saying that the universe imposes no tasks upon us but such as the most humble can perform? Emerson's creed that everything that ever was or will be is here in the enveloping Now; that man has but to obey himself – 'He who will rest in what he *is*, is a part of Destiny' – is in like manner nothing but an exorcism of all scepticism as to the pertinency of one's natural faculties.

"In a word, 'Son of Man, *stand upon thy feet* and I will speak unto thee!' is the only revelation of truth to which the solving epochs have helped the disciple. But that has been enough to satisfy the greater part of his rational need. *In se* and *per se* the universal essence has hardly been more defined by any of these formulae than by the agnostic *x*; but the mere assurance that my powers, such as they are, are not irrelevant to it, but pertinent, that it speaks to them and will in some way recognize their reply, that I can be a match for it if I will, and not a footless waif, suffices to make it rational to my feeling in the sense given above. Nothing could be more absurd than to hope for the definitive triumph of any philosophy which should refuse to legitimate, and to legitimate in an emphatic manner, the more powerful of our emotional and practical tendencies. Fatalism, whose solving word in all crises of behavior is 'All striving is vain', will never reign supreme, for the impulse to take life strivingly is indestructible in the race. Moral creeds which speak to that impulse will be widely successful in spite of inconsistency, vagueness, and shadowy

determination of expectancy. Man needs a rule for his will, and will invent one if one be not given him."

After the emotional and active needs come the intellectual and aesthetic ones. The two great aesthetic principles, of richness and of ease, dominate our intellectual as well as our sensuous life. And, *ceteris paribus*, no system which should not be rich, simple, and harmonious would have a chance of being chosen for belief, if rich, simple, and harmonious systems were also there. Into the latter we should unhesitatingly settle, with that welcoming attitude of the will in which belief consists. To quote from a remarkable book:

> "This law, that our consciousness constantly tends to the minimum of complexity and to the maximum of definiteness, is of great importance for all our knowledge.... Our own activity of attention will thus determine what we are to know and what we are to believe. If things have more than a certain complexity, not only will our limited powers of attention forbid us to unravel this complexity, but we shall strongly desire to believe the things much simpler than they are. For our thoughts about them will have a constant tendency to become as simple and definite as possible. Put a man into a perfect chaos of phenomena, sights, sounds, feelings; and if the man continued to exist, and to be rational at all, his attention would doubtless soon find for him a way to make up some kind of rhythmic regularity, which he would impute to the things about him, so as to imagine that he had discovered some laws of sequence in this mad new world. And thus, in every case where we fancy ourselves sure of a simple law of Nature, we must remember that a great deal of the fancied simplicity may be due in the given case not to Nature, but to the ineradicable prejudice of our own minds in favor of regularity and simplicity. All our thoughts are determined, in great measure, by this law of least effort, as it is found exemplified in our activity of attention.... The aim of the whole process seems to be to reach as complete and united a conception of reality as is possible, a conception wherein the greatest fulness of data shall be combined with the greatest simplicity of conception. The effort of consciousness seems to be to combine the greatest richness of content with the greatest definiteness of organization."[27]

The richness is got by including all the facts of sense in the scheme; the simplicity, by deducing them out of the smallest possible number of permanent and independent primordial entities: the definite organization, by assimilating these latter to ideal objects between which relations of an inwardly

[27] J. Royce, *The Religious Aspect of Philosophy* (Boston, 1885). pp. 316–17, 357.

rational sort obtain. What these ideal objects and rational relations are will require a separate chapter to show.[28] Meanwhile, enough has surely been said to justify the assertion made above that no general offhand answer can be given as to which objects mankind shall choose as its realities. The fight is still under way. Our minds are yet chaotic; and at best we make a mixture and a compromise, as we yield to the claim of this interest or that, and follow first one and then another principle in turn. It is undeniably true that materialistic, or so-called 'scientific', conceptions of the universe have so far gratified the purely intellectual interests more than the mere sentimental conceptions have. But, on the other hand, as already remarked, they leave the emotional and active interests cold. *The perfect object of belief would be a God or 'Soul of the World', represented both optimistically and moralistically (if such a combination could be), and withal so definitely conceived as to show us why our phenomenal experiences should be sent to us by Him in just the very way in which they come.* All Science and all History would thus be accounted for in the deepest and simplest fashion. The very room in which I sit, its sensible walls and floor, and the feeling the air and fire within it give me, no less than the 'scientific' conceptions which I am urged to frame concerning the mode of existence of all these phenomena when my back is turned, would then all be corroborated, not de-realized, by the ultimate principle of my belief. The World-soul sends me just those phenomena in order that I may react upon them; and among the reactions is the intellectual one of spinning these conceptions. What is *beyond* the crude experiences is not an *alternative* to them, but something that *means* them for me here and now. It is safe to say that, if ever such a system is satisfactorily excogitated, mankind will drop all other systems and cling to that one alone as real. Meanwhile the other systems coexist with the attempts at that one, and, all being alike fragmentary, each has its little audience and day.

I have now, I trust, shown sufficiently what the psychologic sources of the sense of reality are. Certain postulates are given in our nature; and whatever satisfies those postulates is treated as if real.[29] I might therefore finish the chapter here, were it not that a few additional words will set the truth in a still clearer light.

[28] Chapter XXVIII.

[29] Prof. Royce puts this well in discussing idealism and the reality of an 'external' world. "If the history of popular speculation on these topics could be written, how much of cowardice and shuffling would be found in the behavior of the natural mind before the question, 'How dost thou know of an external reality?' Instead of simply and plainly answering: 'I mean by the external world in the first place something that I accept or demand, that I posit, postulate, actively construct on the basis of sense-data', the natural man gives us all kinds of vague compromise answers.... Where shall these endless turnings and twistings have an end? ... All these lesser motives are appealed to, and the one ultimate

DOUBT

There is hardly a common man who (if consulted) would not say that things come to us in the first instance *as ideas*; and that if we take them for realities, it is because we *add something to them*, namely, the predicate of having also '*real existence outside of our thought*'. This notion that a higher faculty than the mere *having* of a conscious content is needed to make us know anything real by its means has pervaded psychology from the earliest times, and is the tradition of Scholasticism, Kantism, and Common-sense. Just as sensations must come as inward affections and then be 'extradited'; as objects of memory must appear at first as presently unrealities, and subsequently be 'projected' backwards as past realities; so conceptions must be *entia rationis* till a higher faculty uses them as windows to look beyond the ego, into the real *extra*-mental world; – so runs the orthodox and popular account.

And there is no question that this is a true account of the way in which many of our later beliefs come to pass. The logical distinction between the bare thought of an object and belief in the object's reality is often a chronological distinction as well. The having and the crediting of and idea do not always coalesce; for often we first suppose and then believe; first play with the notion, frame the hypothesis, and then affirm the existence, of an object of thought. And we are quite conscious of the succession of the two mental acts. But these cases are none of them *primitive* cases. They only occur in minds long schooled to doubt by the contradictions of experience. *The primitive impulse is to affirm immediately the reality of all that is conceived*.[30] When we do doubt, however, in what does the subsequent

motive is neglected. The ultimate motive with the man of every-day life is the *will to have an external world*. Whatever consciousness contains, reason will persist in spontaneously adding the thought: 'But there *shall be* something beyond this' ... The popular assurance of an external world is the *fixed determination to make one*, now and henceforth." (*Religious Aspect of Philosophy*, p. 303–4 – the italics are my own.) This immixture of the will appears most flagrantly in the fact that although external matter is doubted commonly enough, minds external to our own are never doubted. We need them too much, are too essentially social to dispense with them. Semblances of matter may suffice to react upon, but not semblances of communing souls. A psychic solipsism is too hideous a mockery of our wants, and, so far as I know, has never been seriously entertained. – Chapters IX and X of Prof. Royce's work are on the whole the clearest account of the psychology of belief with which I am acquainted.

30 "The leading fact in Belief, according to my view of it, is our Primitive Credulity. We begin by believing everything; whatever is, is true.... The animal born in the morning of a summer day proceeds upon the fact of daylight; assumes the perpetuity of that fact. Whatever it is disposed to do, it does without misgivings. If in the morning it began around of operations continuing for hours, under the full benefit of daylight, it would unhesitatingly begin the same round in the evening. Its state of mind is practically one of unbounded confidence; but, as yet, it does not understand what confidence means.

resolution of the doubt consist? It either consists in a purely verbal performance, the coupling of the adjectives 'real' or 'outwardly existing' (as predicates) to the thing originally conceived (as subject); or it consists in the perception in the given case of *that for which these adjectives*, abstracted from other similar concrete cases, *stand*. But what these adjectives stand for, we now know well. They stand for certain relations (immediate, or through intermediaries) to ourselves. Whatever concrete objects have hitherto stood in those relations have been for us 'real', 'outwardly existing'. So that when we now abstractly admit a thing to be 'real' (without perhaps going through any definite perception of its relations), it is as if we said "it belongs in the same world with those other objects." Naturally enough, we have hourly opportunities for this summary process of belief. All remote objects in space or time are believed in this way. When I believe that some prehistoric savage chipped this flint, for example, the reality of the savage and of his act makes no direct appeal either to my sensation, emotion, or volition. What I mean by my belief in it is simply my dim sense of a *continuity* between the long dead savage and his doings and the present world of which the hint forms part. It is pre-eminently a case for applying our doctrine of the 'fringe' (see Vol. I, p. 258). When I think the savage with one fringe of relationship, I believe in him; when I think him without that fringe, or with another one (as, e.g., if I should class him with 'scientific vagaries' in general), I disbelieve him. The word 'real' itself is, in short, a fringe.

RELATIONS OF BELIEF AND WILL

We shall see in Chapter XXVI that will consists in nothing but a manner of attending to certain objects, or consenting to their stable presence before the mind. The objects, in the case of will, are those whose existence depends on our thought, movements of our own body for example, or facts which such movements executed in future may make real. Objects of belief, on the contrary, are those which do not change according as we

"The pristine assurance is soon met by checks; a disagreeable experience leading to new insight. To be thwarted and opposed is one of our earliest and most frequent pains. It develops the sense of a distinction between free and obstructed impulses; the unconsciousness of an open way is exchanged for consciousness; we are now said properly to believe in what has never been contradicted, as we disbelieve in what has been contradicted. We believe that, after the dawn of day, there is before us a continuance of light; we do not believe that this light is to continue forever.

"Thus, the vital circumstance in belief is never to be contradicted – never to lose *prestige*. The number of repetitions counts for little in the process: we are as much convinced after ten as after fifty; we are more convinced by ten unbroken than by fifty for and one against." (Bain: *The Emotions and the Will*, pp. 511, 512.)

think regarding them. I *will* to get up early tomorrow morning; I *believe* that I got up late yesterday morning; I *will* that my foreign bookseller in Boston shall procure me a German book and write to him to that effect. I *believe* that he will make me pay three dollars for it when it comes, etc. Now the important thing to notice is that this difference between the objects of will and belief is entirely immaterial, as far as the relation of the mind to them goes. All that the mind does is in both cases the same; it looks at the object and consents to its existence, espouses it, says 'it shall be my reality'. It turns to it, in short, in the interested active emotional way. The rest is done by nature, which in some cases *makes* the objects real which we think of in this manner, and in other cases does not. Nature cannot change the past to suit our thinking. She cannot change the stars or the winds; but she *does* change our bodies to suit our thinking, and through their instrumentality changes much besides; so the great practical distinction between objects which we may will or unwill, and objects which we can merely believe or disbelieve, grows up, and is of course one of the most important distinctions in the world. Its roots, however, do not lie in psychology, but in physiology; as the chapter on Volition will abundantly make plain. *Will and belief, in short, meaning a certain relation between objects and the Self, are two names for one and the same* PSYCHOLOGICAL *phenomenon*. All the questions which arise concerning one are questions which arise concerning the other. The causes and conditions of the peculiar relation must be the same in both. The free-will question arises as regards belief. If our wills are indeterminate, so must our beliefs be, etc. The first act of free-will, in short, would naturally be to believe in free-will, etc. In Chapter XXVI, I shall mention this again.

A practical observation may end this chapter. If belief consists in an emotional reaction of the entire man on an object, how *can* we believe at will? We cannot control our emotions. Truly enough, a man cannot believe at will abruptly. Nature sometimes, and indeed not very infrequently, produces instantaneous conversions for us. She suddenly puts us in an active connection with objects of which she had till then left us cold. "I realize for the first time," we then say, "what that means!" This happens often with moral propositions. We have often heard them; but now they shoot into our lives; they move us; we feel their living force. Such instantaneous beliefs are truly enough not to be achieved by will. But *gradually* our will can lead us to same results by a very simple method: *we need only in cold blood* ACT *as if the thing in question were real, and keep acting as if it were real, and it infallibly end by growing into such a connection with our life that it will become real*. It will become so knit with habit and emotion that our interests in it will be those which characterize belief. Those to whom 'God' and 'Duty' are now mere names can make them much more than that, if they make a little sacrifice to them every day. But

all this is so well known in moral and religious education that I need say no more.[31]

Mill: *Analysis of the Human Mind*, chapter xi. Charles Renouvier: *Psychologie rationnelle*, vol. II, pt. ii; and *Esquisse d'une classification systématique des doctrines philosophiques*, part vi. J. H. Newman: *A Grammar of Assent*. J. Venn: *On Some of the Characteristics of Belief*. V. Brochard: *De l'erreur*, part II, chap. vi, ix; and *Revue Philosophique*, XVIII, 1. E. Rabier: *Psychologie*, chap xxi, Appendix. Ollé-Laprune: *De la certitude morale* (1880). G. F. Stout: "The Genesis of the Cognition of Physical Reality," in Mind, Jan. 1890. J. Pikler: *The Psychology of the Belief in Objective Existence* (London, 1890). – Mill says that we believe present sensations; and makes our belief in all other things a matter of *association* with these. So far so good; but as he makes no mention of emotional or volitional reaction, Bain rightly charges him with treating belief as a purely intellectual state. For Bain belief is rather an incident of our active life. When a thing is such as to make us *act* on it, then we believe it, according to Bain. "But how about past things, or remote things, upon which no reaction of ours is possible? And how about belief in things which *check* action" says Sully, who considers that we believe a thing only when "the idea of it has an inherent tendency to approximate in character and intensity to a sensation." It is obvious that each of these authors emphasizes a true aspect of the question. My own account has sought to be more complete, sensation, association, and active reaction all being acknowledged to be concerned. The most compendious possible formula perhaps would be that *our belief and attention* are the same fact. For the moment, what we attend to is reality; Attention is a motor reaction; and we are so made that sensations force attention from us. On Belief and Conduct see an article by Leslie Stephen, *Fortnightly Review*, Sept. 1888.

A set of facts have been recently brought to my attention which I hardly know how to treat, so I say a word about them in this footnote. Refer to a type of experience which has frequently found a place among the 'Yes' answers to the 'Census of Hallucinations', and which is generally described by those who report it as an 'impression of the presence' of someone near them, although no sensation either of sight, hearing, or touch is involved. From the way in which this experience is spoken of by those who have had it, it would appear to be an extremely definite and positive state of mind, coupled with a belief in the reality of its object quite as strong as any direct sensation ever gives. And yet *no* sensation seems to be connected with it at all. Sometimes the person whose nearness is thus impressed is a known person, dead or living, sometimes an unknown one. His attitude and situation are often very definitely impressed, and so, sometimes (though not by way of hearing), are words which he wishes to say.

The phenomenon would seem to be due to a pure *conception* becoming saturated with the sort of stinging urgency which ordinarily only sensations bring. But I cannot yet persuade myself that the urgency in question consists in concomitant emotional and motor impulses. The 'impression' may come quite suddenly and depart quickly; it may carry no emotional suggestions, and wake no motor consequences beyond those involved in attending to it. Altogether, the matter is somewhat paradoxical, and no conclusion can be come to until more definite data are obtained.

Perhaps the most curious case of the sort which I have received is the following. The subject of the observation, Mr. P., is an exceptionally intelligent witness, though the words of the narrative are his wife's.

"Mr. P. has all his life been the occasional subject of rather singular delusions or impressions of various kinds. If I had belief in the existence of latent or embryo faculties, other than the five senses, I should explain them on that ground. Being totally blind, his other perceptions are abnormally keen and developed, and given the existence of a rudimentary sixth sense, it would be only natural that this also should be more acute in him than in others. One of the most interesting of his experiences in this line was the frequent apparition of a corpse some years ago, which may be worth the attention of your Committee on that subject. At the lime Mr. P. had a music-room in Boston on Beacon Street, where he used to do severe and protracted practice with little interruption. Now, all one season it was a very familiar occurrence with him while in the midst of work to feel a cold draft of air suddenly upon his face, with a prickling sensation at the roots of his hair, when he would turn from the piano, and a figure which he knew to be dead would come sliding under the crack of the door from without, flattening itself to squeeze through and rounding out again to the human form. It was of a middle-aged man, and drew itself along the carpet on hands and knees, but with head thrown back till it reached the sofa, upon which it stretched itself. It remained some moments, but vanished always if Mr. P. spoke or made a decided movement. The most singular point in the occurrence was its frequent repetition. He might expect it on any day between two and four o'clock, and it came always heralded by the same sudden cold shiver, and was invariably the same figure which went through the same movements. He afterwards traced the whole experience to strong tea. He was in the habit of taking cold tea, which always stimulates him, for lunch, and on giving up this practice he never saw this or any other apparition again. However, even allowing, as is doubtless true, that the event was a delusion of nerves first fatigued by overwork and then excited by this stimulant, there is one point which is still wholly inexplicable and highly interesting to me. Mr. P. has no memory whatever of sight, nor conception of it. It is impossible for him to form any idea of what we mean by light or color, consequently he has no cognizance of any object which does not reach his sense of hearing or of touch, though these are so acute as to give a contrary impression sometimes to other people. When he becomes aware of the presence of a person or an object, by means which seem mysterious to outsiders, he can always trace it naturally and legitimately to slight echoes, perceptible only to his keen ears, or to differences in atmospheric pressure, perceptible only to his acute nerves of touch; but with the apparition described, for the only time in his experience, he was aware of presence, size, and appearance, without the use of either of these mediums. The figure never produced the least sound nor came within a number of feet of his person, yet he knew that it was a man, that it moved, and in what direction, even that it wore a full beard, which, like the thick curly heir, was partially gray; also that it war, dressed in the style of suit known as 'pepper and salt'. These points were all perfectly distinct and invariable each time. If asked how he perceived them, he will answer he cannot tell, he simply knew it, and so strongly and so distinctly that it is impossible to shake the opinion as to the exact details of the man's appearance. It would seem that in this delusion of the senses he really *saw*, as he has never done in the actual experiences of life, except in the first two years of childhood."

On cross-examining Mr. P., I could not make out that there was anything like visual imagination involved, although he was quite unable to describe in just what terms the false perception was carried on. It seemed to be more like an intensely definite *conception* than anything else, a conception to which the feeling of *present reality* was attached, but in no such shape as easily to fail under the heads laid down in my text.

THE WILL TO BELIEVE

William James, "The Will to Believe." *The Will to Believe and Other Essays in Popular Philosophy* (New York: Longmans, Green, and Co., 1897), chap. 1, pp. 1–31.

An Address to the Philosophical Clubs of Yale and Brown Universities. First published in the *New World*, June, 1896.

In the recently published *Life* by Leslie Stephen of his brother, Fitzjames, there is an account of a school to which the latter went when he was a boy. The teacher, a certain Mr. Guest, used to converse with his pupils in this wise: "Gurney, what is the difference between justification and sanctification? – Stephen, prove the omnipotence of God!" etc. In the midst of our Harvard freethinking and indifference we are prone to imagine that here at your good old orthodox College conversation continues to be somewhat upon this order; and to show you that we at Harvard have not lost all interest in these vital subjects, I have brought with me to-night something like a sermon on justification by faith to read to you, – I mean an essay in justification of faith, a defence of our right to adopt a believing attitude in religious matters, in spite of the fact that our merely logical intellect may not have been coerced. "The Will to Believe," accordingly, is the title of my paper.

I have long defended to my own students the lawfulness of voluntarily adopted faith; but as soon as they have got well imbued with the logical spirit, they have as a rule refused to admit my contention to be lawful philosophically, even though in point of fact they were personally all the time chock-full of some faith or other themselves. I am all the while, however, so profoundly convinced that my own position is correct, that your invitation has seemed to me a good occasion to make my statements more clear. Perhaps your minds will be more open than those with which I have hitherto had to deal. I will be as little technical as I can, though I must begin by setting up some technical distinctions that will help us in the end.

I

Let us give the name of *hypothesis* to anything that may be proposed to our belief; and just as the electricians speak of live and dead wires, let us speak of any hypothesis as either *live* or *dead*. A live hypothesis is one which

appeals as a real possibility to him to whom it is proposed. If I ask you to believe in the Mahdi, the notion makes no electric connection with your nature – it refuses to scintillate with any credibility at all. As an hypothesis it is completely dead. To an Arab, however (even if he be not one of the Mahdi's followers), the hypothesis is among the mind's possibilities: it is alive. This shows that deadness and liveness in an hypothesis are not intrinsic properties, but relations to the individual thinker. They are measured by his willingness to act. The maximum of liveness in an hypothesis means willingness to act irrevocably. Practically, that means belief; but there is some believing tendency wherever there is willingness to act at all.

Next, let us call the decision between two hypotheses an *option*. Options may be of several kinds. They may be – 1, *living* or *dead*; 2, *forced* or *avoidable*; 3, *momentous* or *trivial*; and for our purposes we may call an option a *genuine* option when it is of the forced, living, and momentous kind.

1. A living option is one in which both hypotheses are live ones. If I say to you: "Be a theosophist or be a Mohammedan," it is probably a dead option, because for you neither hypothesis is likely to be alive. But if I say: "Be an agnostic or be a Christian," it is otherwise: trained as you are, each hypothesis makes some appeal, however small, to your belief.

2. Next, if I say to you: "Choose between going out with your umbrella or without it," I do not offer you a genuine option, for it is not forced. You can easily avoid it by not going out at all. Similarly, if I say, "Either love me or hate me," "Either call my theory true or call it false," your option is avoidable. You may remain indifferent to me, neither loving nor hating, and you may decline to offer any judgment as to my theory. But if I say, "Either accept this truth or go without it," I put on you a forced option, for there is no standing place outside of the alternative. Every dilemma based on a complete logical disjunction, with no possibility of not choosing, is an option of this forced kind.

3. Finally, if I were Dr. Nansen and proposed to you to join my North Pole expedition, your option would be momentous; for this would probably be your only similar opportunity, and your choice now would either exclude you from the North Pole sort of immortality altogether or put at least the chance of it into your hands. He who refuses to embrace a unique opportunity loses the prize as surely as if he tried and failed. *Per contra*, the option is trivial when the opportunity is not unique, when the stake is insignificant, or when the decision is reversible if it later prove unwise. Such trivial options abound in the scientific life. A chemist finds an hypothesis live enough to spend a year in its verification: he believes in it to that extent. But if his experiments prove inconclusive either way, he is quit for his loss of time, no vital harm being done.

It will facilitate our discussion if we keep all these distinctions well in mind.

II

The next matter to consider is the actual psychology of human opinion. When we look at certain facts, it seems as if our passional and volitional nature lay at the root of all our convictions. When we look at others, it seems as if they could do nothing when the intellect had once said its say. Let us take the latter facts up first.

Does it not seem preposterous on the very face of it to talk of our opinions being modifiable at will? Can our will either help or hinder our intellect in its perceptions of truth? Can we, by just willing it, believe that Abraham Lincoln's existence is a myth, and that the portraits of him in *McClure's Magazine* are all of some one else? Can we, by any effort of our will, or by any strength of wish that it were true, believe ourselves well and about when we are roaring with rheumatism in bed, or feel certain that the sum of the two one-dollar bills in our pocket must be a hundred dollars? We can *say* any of these things, but we are absolutely impotent to believe them; and of just such things is the whole fabric of the truths that we do believe in made up – matters of fact, immediate or remote, as Hume said, and relations between ideas, which are either there or not there for us if we see them so, and which if not there cannot be put there by any action of our own.

In Pascal's *Thoughts* there is a celebrated passage known in literature as Pascal's wager. In it he tries to force us into Christianity by reasoning as if our concern with truth resembled our concern with the stakes in a game of chance. Translated freely his words are these: You must either believe or not believe that God is – which will you do? Your human reason cannot say. A game is going on between you and the nature of things which at the day of judgment will bring out either heads or tails. Weigh what your gains and your losses would be if you should stake all you have on heads, or God's existence: if you win in such case, you gain eternal beatitude; if you lose, you lose nothing at all. If there were an infinity of chances, and only one for God in this wager, still you ought to stake your all on God; for though you surely risk a finite loss by this procedure, any finite loss is reasonable, even a certain one is reasonable, if there is but the possibility of infinite gain. Go, then, and take holy water, and have masses said; belief will come and stupefy your scruples – *Cela vous fera croire et vous abêtira.* Why should you not? At bottom, what have you to lose?

You probably feel that when religious faith expresses itself thus, in the language of the gaming-table, it is put to its last trumps. Surely Pascal's own personal belief in masses and holy water had far other springs; and this celebrated page of his is but an argument for others, a last desperate snatch at a weapon against the hardness of the unbelieving heart. We feel that a faith in masses and holy water adopted wilfully after such a mechanical calculation would lack the inner soul of faith's reality; and if we were ourselves in the place of the Deity, we should probably take particular pleasure in cutting off

believers of this pattern from their infinite reward. It is evident that unless there be some pre-existing tendency to believe in masses and holy water, the option offered to the will by Pascal is not a living option. Certainly no Turk ever took to masses and holy water on its account; and even to us Protestants these means of salvation seem such foregone impossibilities that Pascal's logic, invoked for them specifically, leaves us unmoved. As well might the Mahdi write to us, saying, "I am the Expected One whom God has created in his effulgence. You shall be infinitely happy if you confess me; otherwise you shall be cut off from the light of the sun. Weigh, then, your infinite gain if I am genuine against your finite sacrifice if I am not!" His logic would be that of Pascal; but he would vainly use it on us, for the hypothesis he offers us is dead. No tendency to act on it exists in us to any degree.

The talk of believing by our volition seems, then, from one point of view, simply silly. From another point of view it is worse than silly, it is vile. When one turns to the magnificent edifice of the physical sciences, and sees how it was reared; what thousands of disinterested moral lives of men lie buried in its mere foundations; what patience and postponement, what choking down of preference, what submission to the icy laws of outer fact are wrought into its very stones and mortar; how absolutely impersonal it stands in its vast augustness – then how besotted and contemptible seems every little sentimentalist who comes blowing his voluntary smoke-wreaths, and pretending to decide things from out of his private dream! Can we wonder if those bred in the rugged and manly school of science should feel like spewing such subjectivism out of their mouths? The whole system of loyalties which grow up in the schools of science go dead against its toleration; so that it is only natural that those who have caught the scientific fever should pass over to the opposite extreme, and write sometimes as if the incorruptibly truthful intellect ought positively to prefer bitterness and unacceptableness to the heart in its cup.

> "It fortifies my soul to know
> That, though I perish, Truth is so –"

sings Clough, while Huxley exclaims: "My only consolation lies in the reflection that, however bad our posterity may become, so far as they hold by the plain rule of not pretending to believe what they have no reason to believe, because it may be to their advantage so to pretend [the word 'pretend' is surely here redundant], they will not have reached the lowest depth of immorality." And that delicious *enfant terrible* Clifford writes: "Belief is desecrated when given to unproved and unquestioned statements for the solace and private pleasure of the believer.... Whoso would deserve well of his fellows in this matter will guard the purity of his belief with a very fanaticism of jealous care, lest at any time it should rest on an unworthy

object, and catch a stain which can never be wiped away.... If [a] belief has been accepted on insufficient evidence [even though the belief be true, as Clifford on the same page explains] the pleasure is a stolen one.... It is sinful, because it is stolen in defiance of our duty to mankind. That duty is to guard ourselves from such beliefs as from a pestilence which may shortly master our own body and then spread to the rest of the town.... It is wrong always, everywhere, and for every one, to believe anything upon insufficient evidence."

III

All this strikes one as healthy, even when expressed, as by Clifford, with somewhat too much of robustious pathos in the voice. Free-will and simple wishing do seem, in the matter of our credences, to be only fifth wheels to the coach. Yet if any one should thereupon assume that intellectual insight is what remains after wish and will and sentimental preference have taken wing, or that pure reason is what then settles our opinions, he would fly quite as directly in the teeth of the facts.

It is only our already dead hypotheses that our willing nature is unable to bring to life again. But what has made them dead for us is for the most part a previous action of our willing nature of an antagonistic kind. When I say "willing nature," I do not mean only such deliberate volitions as may have set up habits of belief that we cannot now escape from – I mean all such factors of belief as fear and hope, prejudice and passion, imitation and partisanship, the circumpressure of our caste and set. As a matter of fact we find ourselves believing, we hardly know how or why. Mr. Balfour gives the name of "authority" to all those influences, born of the intellectual climate, that make hypotheses possible or impossible for us, alive or dead. Here in this room, we all of us believe in molecules and the conservation of energy, in democracy and necessary progress, in Protestant Christianity and the duty of fighting for "the doctrine of the immortal Monroe," all for no reasons worthy of the name. We see into these matters with no more inner clearness, and probably with much less, than any disbeliever in them might possess. His unconventionality would probably have some grounds to show for its conclusions; but for us, not insight, but the *prestige* of the opinions, is what makes the spark shoot from them and light up our sleeping magazines of faith. Our reason is quite satisfied, in nine hundred and ninety-nine cases out of every thousand of us, if it can find a few arguments that will do to recite in case our credulity is criticized by someone else. Our faith is faith in someone else's faith, and in the greatest matters this is most the case. Our belief in truth itself, for instance, that there is a truth, and that our minds and it are made for each other – what is it but a passionate affirmation of desire, in which our social system backs us up? We want to have a truth; we want to believe that our experiments and studies and discussions must put us in a continually better

and better position towards it; and on this line we agree to fight out our thinking lives. But if a pyrrhonistic sceptic asks us *how we know* all this, can our logic find a reply? No! certainly it cannot. It is just one volition against another – we willing to go in for life upon a trust or assumption which he, for his part, does not care to make.[1]

As a rule we disbelieve all facts and theories for which we have no use. Clifford's cosmic emotions find no use for Christian feelings. Huxley belabors the bishops because there is no use for sacerdotalism in his scheme of life. Newman, on the contrary, goes over to Romanism, and finds all sorts of reasons good for staying there, because a priestly system is for him an organic need and delight. Why do so few "scientists" even look at the evidence for telepathy, so-called? Because they think, as a leading biologist, now dead, once said to me, that even if such a thing were true, scientists ought to band together to keep it suppressed and concealed. It would undo the uniformity of Nature and all sorts of other things without which scientists cannot carry on their pursuits. But if this very man had been shown something which as a scientist he might *do* with telepathy, he might not only have examined the evidence, but even have found it good enough. This very law which the logicians would impose upon us – if I may give the name of logicians to those who would rule out our willing nature here – is based on nothing but their own natural wish to exclude all elements for which they, in their professional quality of logicians, can find no use.

Evidently, then, our non-intellectual nature does influence our convictions. There are passional tendencies and volitions which run before and others which come after belief, and it is only the latter that are too late for the fair; and they are not too late when the previous passional work has been already in their own direction. Pascal's argument, instead of being powerless, then seems a regular clincher, and is the last stroke needed to make our faith in masses and holy water complete. The state of things is evidently far from simple; and pure insight and logic, whatever they might do ideally, are not the only things that really do produce our creeds.

IV

Our next duty, having recognized this mixed-up state of affairs, is to ask whether it be simply reprehensible and pathological, or whether, on the contrary, we must treat it as a normal element in making up our minds. The thesis I defend is, briefly stated, this: *Our passional nature not only lawfully may, but must, decide an option between propositions, whenever it is a genuine option that cannot by its nature be decided on intellectual grounds;*

[1] Compare the admirable page 310 in S. H. Hodgson's *Time and Space*, London, 1865.

for to say, under such circumstances, "Do not decide, but leave the question open," is itself a passional decision – just like deciding yes or no – and is attended with the same risk of losing the truth. The thesis thus abstractly expressed will, I trust, soon become quite clear. But I must first indulge in a bit more of preliminary work.

V

It will be observed that for the purposes of this discussion we are on "dogmatic" ground – ground, I mean, which leaves systematic philosophical scepticism altogether out of account. The postulate that there is truth, and that it is the destiny of our minds to attain it, we are deliberately resolving to make, though the sceptic will not make it. We part company with him, therefore, absolutely, at this point. But the faith that truth exists, and that our minds can find it, may be held in two ways. We may talk of the *empiricist* way and of the *absolutist* way of believing in truth. The absolutists in this matter say that we not only can attain to knowing truth, but we can *know when* we have attained to knowing it; while the empiricists think that although we may attain it, we cannot infallibly know when. To *know* is one thing, and to know for certain *that* we know is another. One may hold to the first being possible without the second; hence the empiricists and the absolutists, although neither of them is a sceptic in the usual philosophic sense of the term, show very different degrees of dogmatism in their lives.

If we look at the history of opinions, we see that the empiricist tendency has largely prevailed in science, while in philosophy the absolutist tendency has had everything its own way. The characteristic sort of happiness, indeed, which philosophies yield has mainly consisted in the conviction felt by each successive school or system that by it bottom-certitude had been attained. "Other philosophies are collections of opinions, mostly false; *my* philosophy gives standing-ground forever" – who does not recognize in this the key-note of every system worthy of the name? A system, to be a system at all, must come as a *closed* system, reversible in this or that detail, perchance, but in its essential features never!

Scholastic orthodoxy, to which one must always go when one wishes to find perfectly clear statement, has beautifully elaborated this absolutist conviction in a doctrine which it calls that of "objective evidence." If, for example, I am unable to doubt that I now exist before you, that two is less than three, or that if all men are mortal then I am mortal too, it is because these things illumine my intellect irresistibly. The final ground of this objective evidence possessed by certain propositions is the *adaequatio intellectûs nostri cum rê.* The certitude it brings involves an *aptitudinem ad extorquendum certum assensum* on the part of the truth envisaged, and on the side of the subject a *quietem in cognitione,* when once the object is mentally received, that leaves

no possibility of doubt behind; and in the whole transaction nothing operates but the *entitas ipsa* of the object and the *entitas ipsa* of the mind. We slouchy modern thinkers dislike to talk in Latin – indeed, we dislike to talk in set terms at all; but at bottom our own state of mind is very much like this whenever we uncritically abandon ourselves: You believe in objective evidence, and I do. Of some things we feel that we are certain: we know, and we know that we do know. There is something that gives a click inside of us, a bell that strikes twelve, when the hands of our mental clock have swept the dial and meet over the meridian hour. The greatest empiricists among us are only empiricists on reflection: when left to their instincts, they dogmatize like infallible popes. When the Cliffords tell us how sinful it is to be Christians on such "insufficient evidence," insufficiency is really the last thing they have in mind. For them the evidence is absolutely sufficient, only it makes the other way. They believe so completely in an anti-christian order of the universe that there is no living option: Christianity is a dead hypothesis from the start.

VI

But now, since we are all such absolutists by instinct, what in our quality of students of philosophy ought we to do about the fact? Shall we espouse and indorse it? Or shall we treat it as a weakness of our nature from which we must free ourselves, if we can?

I sincerely believe that the latter course is the only one we can follow as reflective men. Objective evidence and certitude are doubtless very fine ideals to play with, but where on this moonlit and dream-visited planet are they found? I am, therefore, myself a complete empiricist so far as my theory of human knowledge goes. I live, to be sure, by the practical faith that we must go on experiencing and thinking over our experience, for only thus can our opinions grow more true; but to hold any one of them – I absolutely do not care which – as if it never could be re-interpretable or corrigible, I believe to be a tremendously mistaken attitude, and I think that the whole history of philosophy will bear me out. There is but one indefectibly certain truth, and that is the truth that pyrrhonistic scepticism itself leaves standing – the truth that the present phenomenon of consciousness exists. That, however, is the bare starting-point of knowledge, the mere admission of a stuff to be philosophized-about. The various philosophies are but so many attempts at expressing what this stuff really is. And if we repair to our libraries what disagreement do we discover! Where is a certainly true answer found? Apart from abstract propositions of comparison (such as two and two are the same as four), propositions which tell us nothing by themselves about concrete reality, we find no proposition ever regarded by anyone as evidently certain that has not either been called a falsehood, or at least had its truth sincerely questioned by someone else. The transcending of the axioms of geometry, not

in play but in earnest, by certain of our contemporaries (as Zöllner and Charles H. Hinton), and the rejection of the whole Aristotelian logic by the Hegelians, are striking instances in point.

No concrete test of what is really true has ever been agreed upon. Some make the criterion external to the moment of perception, putting it either in revelation, the *consensus gentium,* the instincts of the heart, or the systematized experience of the race. Others make the perceptive moment its own test – Descartes, for instance, with his clear and distinct ideas guaranteed by the veracity of God; Reid with his "common-sense"; and Kant with his forms of synthetic judgment *a priori.* The inconceivability of the opposite; the capacity to be verified by sense; the possession of complete organic unity or self-relation, realized when a thing is its own other – are standards which, in turn, have been used. The much lauded objective evidence is never triumphantly there; it is a mere aspiration or *Grenzbegriff*, marking the infinitely remote ideal of our thinking life. To claim that certain truths now possess it, is simply to say that when you think them true and they *are* true, then their evidence is objective, otherwise it is not. But practically one's conviction that the evidence one goes by is of the real objective brand, is only one more subjective opinion added to the lot. For what a contradictory array of opinions have objective evidence and absolute certitude been claimed! The world is rational through and through – its existence is an ultimate brute fact; there is a personal God – a personal God is inconceivable; there is an extra-mental physical world immediately known – the mind can only know its own ideas; a moral imperative exists – obligation is only the resultant of desires; a permanent spiritual principle is in everyone – there are only shifting states of mind; there is an endless chain of causes – there is an absolute first cause; an eternal necessity – a freedom; a purpose – no purpose; a primal One – a primal Many; a universal continuity – an essential discontinuity in things; an infinity – no infinity. There is this – there is that; there is indeed nothing which someone has not thought absolutely true, whilst his neighbor deemed it absolutely false; and not an absolutist among them seems ever to have considered that the trouble may all the time be essential, and that the intellect, even with truth directly in its grasp, may have no infallible signal for knowing whether it be truth or no. When, indeed, one remembers that the most striking practical application to life of the doctrine of objective certitude has been the conscientious labors of the Holy Office of the Inquisition, one feels less tempted than ever to lend the doctrine a respectful ear.

But please observe, now, that when as empiricists we give up the doctrine of objective certitude, we do not thereby give up the quest or hope of truth itself. We still pin our faith on its existence, and still believe that we gain an ever better position towards it by systematically continuing to roll up experiences and think. Our great difference from the scholastic lies in the way we face. The strength of his system lies in the principles, the origin, the *terminus*

a quo of his thought; for us the strength is in the outcome, the upshot, the *terminus ad quem*. Not where it comes from but what it leads to is to decide. It matters not to an empiricist from what quarter an hypothesis may come to him: he may have acquired it by fair means or by foul; passion may have whispered or accident suggested it; but if the total drift of thinking continues to confirm it, that is what he means by its being true.

VII

One more point, small but important, and our preliminaries are done. There are two ways of looking at our duty in the matter of opinion – ways entirely different, and yet ways about whose difference the theory of knowledge seems hitherto to have shown very little concern. *We must know the truth*; and *we must avoid error* – these are our first and great commandments as would-be knowers; but they are not two ways of stating an identical commandment, they are two separable laws. Although it may indeed happen that when we believe the truth *A*, we escape as an incidental consequence from believing the falsehood *B*, it hardly ever happens that by merely disbelieving *B* we necessarily believe *A*. We may in escaping *B* fall into believing other falsehoods, *C* or *D*, just as bad as *B*; or we may escape *B* by not believing anything at all, not even *A*.

Believe truth! Shun error! – these, we see, are two materially different laws; and by choosing between them we may end by coloring differently our whole intellectual life. We may regard the chase for truth as paramount, and the avoidance of error as secondary; or we may, on the other hand, treat the avoidance of error as more imperative, and let truth take its chance. Clifford, in the instructive passage which I have quoted, exhorts us to the latter course. Believe nothing, he tells us, keep your mind in suspense forever, rather than by closing it on insufficient evidence incur the awful risk of believing lies. You, on the other hand, may think that the risk of being in error is a very small matter when compared with the blessings of real knowledge, and be ready to be duped many times in your investigation rather than postpone indefinitely the chance of guessing true. I myself find it impossible to go with Clifford. We must remember that these feelings of our duty about either truth or error are in any case only expressions of our passional life. Biologically considered, our minds are as ready to grind out falsehood as veracity, and he who says "Better go without belief forever than believe a lie!" merely shows his own preponderant private horror of becoming a dupe. He may be critical of many of his desires and fears, but this fear he slavishly obeys. He cannot imagine any one questioning its binding force. For my own part, I have also a horror of being duped; but I can believe that worse things than being duped may happen to a man in this world: so Clifford's exhortation has to my ears a thoroughly fantastic sound. It is like a general informing his soldiers that it

is better to keep out of battle forever than to risk a single wound. Not so are victories either over enemies or over nature gained. Our errors are surely not such awfully solemn things. In a world where we are so certain to incur them in spite of all our caution, a certain lightness of heart seems healthier than this excessive nervousness on their behalf. At any rate, it seems the fittest thing for the empiricist philosopher.

VIII

And now, after all this introduction, let us go straight at our question. I have said, and now repeat it, that not only as a matter of fact do we find our passional nature influencing us in our opinions, but that there are some options between opinions in which this influence must be regarded both as an inevitable and as a lawful determinant of our choice.

I fear here that some of you my hearers will begin to scent danger, and lend an inhospitable ear. Two first steps of passion you have indeed had to admit as necessary – we must think so as to avoid dupery, and we must think so as to gain truth; but the surest path to those ideal consummations, you will probably consider, is from now onwards to take no further passional step.

Well, of course, I agree as far as the facts will allow. Wherever the option between losing truth and gaining it is not momentous, we can throw the chance of *gaining truth* away, and at any rate save ourselves from any chance of *believing falsehood*, by not making up our minds at all till objective evidence has come. In scientific questions, this is almost always the case; and even in human affairs in general, the need of acting is seldom so urgent that a false belief to act on is better than no belief at all. Law courts, indeed, have to decide on the best evidence attainable for the moment, because a judge's duty is to make law as well as to ascertain it, and (as a learned judge once said to me) few cases are worth spending much time over: the great thing is to have them decided on *any* acceptable principle, and got out of the way. But in our dealings with objective nature we obviously are recorders, not makers, of the truth; and decisions for the mere sake of deciding promptly and getting on to the next business would be wholly out of place. Throughout the breadth of physical nature facts are what they are quite independently of us, and seldom is there any such hurry about them that the risks of being duped by believing a premature theory need be faced. The questions here are always trivial options, the hypotheses are hardly living (at any rate not living for us spectators), the choice between believing truth or falsehood is seldom forced. The attitude of sceptical balance is therefore the absolutely wise one if we would escape mistakes. What difference, indeed, does it make to most of us whether we have or have not a theory of the Röntgen rays, whether we believe or not in mind-stuff, or have a conviction about the causality of conscious states? It makes no difference. Such options are not forced on us. On every

account it is better not to make them, but still keep weighing reasons *pro et contra* with an indifferent hand.

I speak, of course, here of the purely judging mind. For purposes of discovery such indifference is to be less highly recommended, and science would be far less advanced than she is if the passionate desires of individuals to get their own faiths confirmed had been kept out of the game. See for example the sagacity which Spencer and Weismann now display. On the other hand, if you want an absolute duffer in an investigation, you must, after all, take the man who has no interest whatever in its results: he is the warranted incapable, the positive fool. The most useful investigator, because the most sensitive observer, is always he whose eager interest in one side of the question is balanced by an equally keen nervousness lest he become deceived.[2] Science has organized this nervousness into a regular *technique*, her so-called method of verification; and she has fallen so deeply in love with the method that one may even say she has ceased to care for truth by itself at all. It is only truth as technically verified that interests her. The truth of truths might come in merely affirmative form, and she would decline to touch it. Such truth as that, she might repeat with Clifford, would be stolen in defiance of her duty to mankind. Human passions, however, are stronger than technical rules. "Le coeur a ses raisons," as Pascal says, "que la raison ne connaît point"; and however indifferent to all but the bare rules of the game the umpire, the abstract intellect, may be, the concrete players who furnish him the materials to judge of are usually, each one of them, in love with some pet "live hypothesis" of his own. Let us agree, however, that wherever there is no forced option, the dispassionately judicial intellect with no pet hypothesis, saving us, as it does, from dupery at any rate, ought to be our ideal.

The question next arises: Are there not somewhere forced options in our speculative questions, and can we (as men who may be interested at least as much in positively gaining truth as in merely escaping dupery) always wait with impunity till the coercive evidence shall have arrived? It seems *a priori* improbable that the truth should be so nicely adjusted to our needs and powers as that. In the great boarding-house of nature, the cakes and the butter and the syrup seldom come out so even and leave the plates so clean. Indeed, we should view them with scientific suspicion if they did.

IX

Moral questions immediately present themselves as questions whose solution cannot wait for sensible proof. A moral question is a question not of what sensibly exists, but of what is good, or would be good if it did exist. Science

[2] Compare Wilfrid Ward's Essay, "The Wish to Believe," in his *Witnesses to the Unseen*, Macmillan & Co., 1893.

can tell us what exists; but to compare the *worths*, both of what exists and of what does not exist, we must consult not science, but what Pascal calls our heart. Science herself consults her heart when she lays it down that the infinite ascertainment of fact and correction of false belief are the supreme goods for man. Challenge the statement and science can only repeat it oracularly, or else prove it by showing that such ascertainment and correction bring man all sorts of other goods which man's heart in turn declares. The question of having moral beliefs at all or not having them is decided by our will. Are our moral preferences true or false, or are they only odd biological phenomena, making things good or bad for *us*, but in themselves indifferent? How can your pure intellect decide? If your heart does not *want* a world of moral reality, your head will assuredly never make you believe in one. Mephistophelian scepticism, indeed, will satisfy the head's play-instincts much better than any rigorous idealism can. Some men (even at the student age) are so naturally cool-hearted that the moralistic hypothesis never has for them any pungent life, and in their supercilious presence the hot young moralist always feels strangely ill at ease. The appearance of knowingness is on their side, of *naïveté* and gullibility on his. Yet, in the inarticulate heart of him, he clings to it that he is not a dupe, and that there is a realm in which (as Emerson says) all their wit and intellectual superiority is no better than the cunning of a fox. Moral scepticism can no more be refuted or proved by logic than intellectual scepticism can. When we stick to it that there *is* truth (be it of either kind), we do so with our whole nature, and resolve to stand or fall by the results. The sceptic with his whole nature adopts the doubting attitude; but which of us is the wiser, Omniscience only knows.

Turn now from these wide questions of good to a certain class of questions of fact, questions concerning personal relations, states of mind between one man and another. *Do you like me or not?* – for example. Whether you do or not depends, in countless instances, on whether I meet you half-way, am willing to assume that you must like me, and show you trust and expectation. The previous faith on my part in your liking's existence is in such cases what makes your liking come. But if I stand aloof, and refuse to budge an inch until I have objective evidence, until you shall have done something apt, as the absolutists say, *ad extorquendum assensum meum*, ten to one your liking never comes. How many women's hearts are vanquished by the mere sanguine insistence of some man that they *must* love him! he will not consent to the hypothesis that they cannot. The desire for a certain kind of truth here brings about that special truth's existence; and so it is in innumerable cases of other sorts. Who gains promotions, boons, appointments, but the man in whose life they are seen to play the part of live hypotheses, who discounts them, sacrifices other things for their sake before they have come, and takes risks for them in advance? His faith acts on the powers above him as a claim, and creates its own verification.

A social organism of any sort whatever, large or small, is what it is because each member proceeds to his own duty with a trust that the other members will simultaneously do theirs. Wherever a desired result is achieved by the co-operation of many independent persons, its existence as a fact is a pure consequence of the precursive faith in one another of those immediately concerned. A government, an army, a commercial system, a ship, a college, an athletic team, all exist on this condition, without which not only is nothing achieved, but nothing is even attempted. A whole train of passengers (individually brave enough) will be looted by a few highwaymen, simply because the latter can count on one another, while each passenger fears that if he makes a movement of resistance, he will be shot before any one else backs him up. If we believed that the whole car-full would rise at once with us, we should each severally rise, and train-robbing would never even be attempted. There are, then, cases where a fact cannot come at all unless a preliminary faith exists in its coming. *And where faith in a fact can help create the fact*, that would be an insane logic which should say that faith running ahead of scientific evidence is the "lowest kind of immorality" into which a thinking being can fall. Yet such is the logic by which our scientific absolutists pretend to regulate our lives!

X

In truths dependent on our personal action, then, faith based on desire is certainly a lawful and possibly an indispensable thing.

But now, it will be said, these are all childish human cases, and have nothing to do with great cosmical matters, like the question of religious faith. Let us then pass on to that. Religions differ so much in their accidents that in discussing the religious question we must make it very generic and broad. What then do we now mean by the religious hypothesis? Science says things are; morality says some things are better than other things; and religion says essentially two things.

First, she says that the best things are the more eternal things, the overlapping things, the things in the universe that throw the last stone, so to speak, and say the final word. "Perfection is eternal" – this phrase of Charles Secrétan seems a good way of putting this first affirmation of religion, an affirmation which obviously cannot yet be verified scientifically at all. The second affirmation of religion is that we are better off even now if we believe her first affirmation to be true.

Now, let us consider what the logical elements of this situation are *in case the religious hypothesis in both its branches be really true.* (Of course, we must admit that possibility at the outset. If we are to discuss the question at all, it must involve a living option. If for any of you religion be a hypothesis that cannot, by any living possibility be true, then you need go no farther. I speak

to the "saving remnant" alone.) So proceeding, we see, first, that religion offers itself as a *momentous* option. We are supposed to gain, even now, by our belief, and to lose by our non-belief, a certain vital good. Secondly, religion is a *forced* option, so far as that good goes. We cannot escape the issue by remaining sceptical and waiting for more light, because, although we do avoid error in that way *if religion be untrue*, we lose the good, *if it be true*, just as certainly as if we positively chose to disbelieve. It is as if a man should hesitate indefinitely to ask a certain woman to marry him because he was not perfectly sure that she would prove an angel after he brought her home. Would he not cut himself off from that particular angel-possibility as decisively as if he went and married some one else? Scepticism, then, is not avoidance of option; it is option of a certain particular kind of risk. *Better risk loss of truth than chance of error* – that is your faith-vetoer's exact position. He is actively playing his stake as much as the believer is; he is backing the field against the religious hypothesis, just as the believer is backing the religious hypothesis against the field. To preach scepticism to us as a duty until "sufficient evidence" for religion be found, is tantamount therefore to telling us, when in presence of the religious hypothesis, that to yield to our fear of its being error is wiser and better than to yield to our hope that it may be true. It is not intellect against all passions, then; it is only intellect with one passion laying down its law. And by what, forsooth, is the supreme wisdom of this passion warranted? Dupery for dupery, what proof is there that dupery through hope is so much worse than dupery through fear? I, for one, can see no proof; and I simply refuse obedience to the scientist's command to imitate his kind of option, in a case where my own stake is important enough to give me the right to choose my own form of risk. If religion be true and the evidence for it be still insufficient, I do not wish, by putting your extinguisher upon my nature (which feels to me as if it had after all some business in this matter), to forfeit my sole chance in life of getting upon the winning side – that chance depending, of course, on my willingness to run the risk of acting as if my passional need of taking the world religiously might be prophetic and right.

All this is on the supposition that it really may be prophetic and right, and that, even to us who are discussing the matter, religion is a live hypothesis which may be true. Now, to most of us religion comes in a still farther way that makes a veto on our active faith even more illogical. The more perfect and more eternal aspect of the universe is represented in our religions as having personal form. The universe is no longer a mere *It* to us, but a *Thou*, if we are religious; and any relation that may be possible from person to person might be possible here. For instance, although in one sense we are passive portions of the universe, in another we show a curious autonomy, as if we were small active centers on our own account. We feel, too, as if the appeal of religion to us were made to our own active good-will, as if evidence

might be forever withheld from us unless we met the hypothesis half-way. To take a trivial illustration: just as a man who in a company of gentlemen made no advances, asked a warrant for every concession, and believed no one's word without proof, would cut himself off by such churlishness from all the social rewards that a more trusting spirit would earn – so here, one who should shut himself up in snarling logicality and try to make the gods extort his recognition willy-nilly, or not get it at all, might cut himself off forever from his only opportunity of making the gods' acquaintance. This feeling, forced on us we know not whence, that by obstinately believing that there are gods (although not to do so would be so easy both for our logic and our life) we are doing the universe the deepest service we can, seems part of the living essence of the religious hypothesis. If the hypothesis *were* true in all its parts, including this one, then pure intellectualism, with its veto on our making willing advances, would be an absurdity; and some participation of our sympathetic nature would be logically required. I, therefore, for one, cannot see my way to accepting the agnostic rules for truth-seeking, or wilfully agree to keep my willing nature out of the game. I cannot do so for this plain reason, that *a rule of thinking which would absolutely prevent me from acknowledging certain kinds of truth if those kinds of truth were really there, would be an irrational rule.* That for me is the long and short of the formal logic of the situation, no matter what the kinds of truth might materially be.

I confess I do not see how this logic can be escaped. But sad experience makes me fear that some of you may still shrink from radically saying with me, *in abstracto*, that we have the right to believe at our own risk any hypothesis that is live enough to tempt our will. I suspect, however, that if this is so, it is because you have got away from the abstract logical point of view altogether, and are thinking (perhaps without realizing it) of some particular religious hypothesis which for you is dead. The freedom to "believe what we will" you apply to the case of some patent superstition; and the faith you think of is the faith defined by the schoolboy when he said, "Faith is when you believe something that you know ain't true." I can only repeat that this is misapprehension. *In concreto*, the freedom to believe can only cover living options which the intellect of the individual cannot by itself resolve; and living options never seem absurdities to him who has them to consider. When I look at the religious question as it really puts itself to concrete men, and when I think of all the possibilities which both practically and theoretically it involves, then this command that we shall put a stopper on our heart, instincts, and courage, and *wait* – acting of course meanwhile more or less as if religion were *not* true[3] – till doomsday, or till such time as our intellect and senses working

[3] Since belief is measured by action, he who forbids us to believe religion to be true, necessarily also forbids us to act as we should if we did believe it to be true. The whole defense of religious faith hinges upon action. If the action required or inspired by the religious

together may have raked in evidence enough – this command, I say, seems to me the queerest idol ever manufactured in the philosophic cave. Were we scholastic absolutists, there might be more excuse. If we had an infallible intellect with its objective certitudes, we might feel ourselves disloyal to such a perfect organ of knowledge in not trusting to it exclusively, in not waiting for its releasing word. But if we are empiricists, if we believe that no bell in us tolls to let us know for certain when truth is in our grasp, then it seems a piece of idle fantasticality to preach so solemnly our duty of waiting for the bell. Indeed we *may* wait if we will – I hope you do not think that I am denying that – but if we do so, we do so at our peril as much as if we believed. In either case we *act,* taking our life in our hands. No one of us ought to issue vetoes to the other, nor should we bandy words of abuse. We ought, on the contrary, delicately and profoundly to respect one another's mental freedom – then only shall we bring about the intellectual republic; then only shall we have that spirit of inner tolerance without which all our outer tolerance is soulless, and which is empiricism's glory; then only shall we live and let live, in speculative as well as in practical things.

I began by a reference to Fitzjames Stephen; let me end by a quotation from him. "What do you think of yourself? What do you think of the world? ... These are questions with which all must deal as it seems good to them. They are riddles of the Sphinx, and in some way or other we must deal with them.... In all important transactions of life we have to take a leap in the dark.... If we decide to leave the riddles unanswered, that is a choice; if we waver in our answer, that, too, is a choice; but whatever choice we make, we make it at our peril. If a man chooses to turn his back altogether on God and the future, no one can prevent him; no one can show beyond reasonable doubt that he is mistaken. If a man thinks otherwise, and acts as he thinks, I do not see how any one can prove that *he* is mistaken. Each must act as he thinks best, and if he is wrong so much the worse for him. We stand on a mountain pass in the midst of whirling snow and blinding mist, through which we get glimpses now and then of paths which may be deceptive. If we stand still, we shall be frozen to death. If we take the wrong road we shall be dashed to pieces. We do not certainly know whether there is any right one. What must we do? 'Be strong and of a good courage.' Act for the best, hope for the best, and take what comes.... If death ends all, we cannot meet death better."[4]

hypothesis is in no way different from that dictated by the naturalistic hypothesis, then religious faith is a pure superfluity, better pruned away, and controversy about its legitimacy is a piece of idle trifling, unworthy of serious minds. I myself believe, of course, that the religious hypothesis gives to the world an expression which specifically determines our reactions, and makes them in a large part unlike what they might be on a purely naturalistic scheme of belief.

PHILOSOPHICAL CONCEPTIONS AND PRACTICAL RESULTS

William James, "Philosophical Conceptions and Practical Results." *The University* (of California) *Chronicle* 1 (September 1898): 287–310.

An occasion like the present would seem to call for an absolutely untechnical discourse. I ought to speak of something connected with life rather than with logic. I ought to give a message with a practical outcome and an emotional musical accompaniment, so to speak, fitted to interest men as men, and yet also not altogether to disappoint philosophers – since philosophers, let them be as queer as they will, still are men in the secret recesses of their hearts, even here at Berkeley. I ought, I say, to produce something simple enough to catch and inspire the rest of you, and yet with just enough of ingenuity and oddity about it to keep the members of the Philosophical Union from yawning and letting their attention wander away.

I confess that I have something of this kind in my mind, a perfectly ideal discourse for the present occasion. Were I to set it down on paper, I verily believe it would be regarded by everyone as the final word of philosophy. It would bring theory down to a single point, at which every human being's practical life would begin. It would solve all the antinomies and contradictions, it would let loose all the right impulses and emotions; and everyone, on hearing it, would say, "Why, that *is* the truth! – *that* is what I have been believing, that is what I have really been living on all this time, but I never could find the words for it before. All that eludes, all that flickers and twinkles, all that invites and vanishes even whilst inviting, is here made a solidity and a possession. Here is the end of unsatisfactoriness, here the beginning of unimpeded clearness, joy, and power." Yes, my friends, I have such a discourse within me! But, do not judge me harshly, I cannot produce it on the present occasion. I humbly apologize; I have come across the continent to this wondrous Pacific Coast – to this Eden, not of the mythical antiquity, but of the solid future of mankind – I ought to give you something worthy of your hospitality, and not altogether unworthy of your great destiny, to help cement our rugged East and your wondrous West together in a spiritual bond – and yet, and yet, and yet, I simply cannot. I have tried to articulate it, but it will not come. Philosophers are after all like poets. They are path-finders. What everyone can feel, what everyone can know in the bone

and marrow of him, they sometimes can find words for and express. The words and thoughts of the philosophers are not exactly the words and thoughts of the poets – worse luck. But both alike have the same function. They are, if I may use a simile, so many spots, or blazes – blazes made by the axe of the human intellect on the trees of the otherwise trackless forest of human experience. They give you somewhere to go from. They give you a direction and a place to reach. They do not give you the integral forest with all its sunlit glories and its moonlit witcheries and wonders. Ferny dells, and mossy waterfalls, and secret magic nooks escape you, owned only by the wild things to whom the region is a home. Happy they without the need of blazes! But to us the blazes give a sort of ownership. We can now use the forest, wend across it with companions, and enjoy its quality. It is no longer a place merely to get lost in and never return. The poet's words and the philosopher's phrases thus are helps of the most genuine sort, giving to all of us hereafter the freedom of the trails they made. Though they create nothing, yet for this marking and fixing function of theirs we bless their names and keep them on our lips, even whilst the thin and spotty and half-casual character of their operations is evident to our eyes.

No one like the path-finder himself feels the immensity of the forest, or knows the accidentality of his own trails. Columbus, dreaming of the ancient East, is stopped by poor pristine simple America, and gets no farther on that day; and the poets and philosophers themselves know as no one else knows that what their formulas express leaves unexpressed almost everything that they organically divine and feel. So I feel that there is a center in truth's forest where I have never been: to track it out and get there is the secret spring of all my poor life's philosophic efforts; at moments I almost strike into the final valley, there is a gleam of the end, a sense of certainty, but always there comes still another ridge, so my blazes merely circle towards the true direction; and although now, if ever, would be the fit occasion, yet I cannot take you to the wondrous hidden spot to-day. To-morrow must be, or to-morrow, or to-morrow, and pretty surely death will overtake me ere the promise is fulfilled.

Of such postponed achievements do the lives of all philosophers consist. Truth's fullness is elusive; ever not quite, not quite! So we fall back on the preliminary blazes – a few formulas, a few technical conceptions, a few verbal pointers – which at least define the initial direction of the trail. And that, to my sorrow, is all that I can do here at Berkeley to-day. Inconclusive I must be, and merely suggestive, though I will try to be as little technical as I can.

I will seek to define with you merely what seems to be the most likely direction in which to start upon the trail of truth. Years ago this direction was given to me by an American philosopher whose home is in the East, and whose published works, few as they are and scattered in periodicals, are no fit expression of his powers. I refer to Mr. Charles S. Peirce, with whose very existence as a philosopher I dare say many of you are unacquainted. He is one

of the most original of contemporary thinkers; and the principle of practicalism – or pragmatism, as he called it, when I first heard him enunciate it at Cambridge in the early '70's – is the clue or compass by following which I find myself more and more confirmed in believing we may keep our feet upon the proper trail.

Peirce's principle, as we may call it, may be expressed in a variety of ways, all of them very simple. In the *Popular Science Monthly* for January, 1878, he introduces it as follows: The soul and meaning of thought, he says, can never be made to direct itself towards anything but the production of belief, belief being the demicadence which closes a musical phrase in the symphony of our intellectual life. Thought in movement has thus for its only possible motive the attainment of thought at rest. But when our thought about an object has found its rest in belief, then our action on the subject can firmly and safely begin. Beliefs, in short, are really rules for action; and the whole function of thinking is but one step in the production of habits of action. If there were any part of a thought that made no difference in the thought's practical consequences, then that part would be no proper element of the thought's significance. Thus the same thought may be clad in different words; but if the different words suggest no different conduct, they are mere outer accretions, and have no part in the thought's meaning. If, however, they determine conduct differently, they are essential elements of the significance. "Please open the door," and, "*Veuillez ouvrir la porte*," in French, mean just the same thing; but "D—n you, open the door," although in English, *means* something very different. Thus to develop a thought's meaning we need only determine what conduct it is fitted to produce; that conduct is for us its sole significance. And the tangible fact at the root of all our thought-distinctions, however subtle, is that there is no one of them so fine as to consist in anything but a possible difference of practice. To attain perfect clearness in our thoughts of an object, then, we need only consider what effects of a conceivably practical kind the object may involve – what sensations we are to expect from it, and what reactions we must prepare. Our conception of these effects, then, is for us the whole of our conception of the object, so far as that conception has positive significance at all.

This is the principle of Peirce, the principle of pragmatism. I think myself that it should be expressed more broadly than Mr. Peirce expresses it. The ultimate test for us of what a truth means is indeed the conduct it dictates or inspires. But it inspires that conduct because it first foretells some particular turn to our experience which shall call for just that conduct from us. And I should prefer for our purposes this evening to express Peirce's principle by saying that the effective meaning of any philosophic proposition can always be brought down to some particular consequence, in our future practical experience, whether active or passive; the point lying rather in the fact that the experience must be particular, than in the fact that it must be active.

To take in the importance of this principle, one must get accustomed to applying it to concrete cases. Such use as I am able to make of it convinces me that to be mindful of it in philosophical disputations tends wonderfully to smooth out misunderstandings and to bring in peace. If it did nothing else, then, it would yield a sovereignly valuable rule of method for discussion. So I shall devote the rest of this precious hour with you to its elucidation, because I sincerely think that if you once grasp it, it will shut your steps out from many an old false opening, and head you in the true direction for the trail.

One of its first consequences is this. Suppose there are two different philosophical definitions, or propositions, or maxims, or what not, which seem to contradict each other, and about which men dispute. If, by supposing the truth of the one, you can foresee no conceivable practical consequence to anybody at any time or place, which is different from what you would foresee if you supposed the truth of the other, why then the difference between the two propositions is no difference – it is only a specious and verbal difference, unworthy of further contention. Both formulas mean radically the same thing, although they may say it in such different words. It is astonishing to see how many philosophical disputes collapse into insignificance the moment you subject them to this simple test. There can be no difference which doesn't make a difference – no difference in abstract truth which does not express itself in a difference of concrete fact, and of conduct consequent upon the fact, imposed on somebody, somehow, somewhere, and somewhen. It is true that a certain shrinkage of values often seems to occur in our general formulas when we measure their meaning in this prosaic and practical way. They diminish. But the vastness that is merely based on vagueness is a false appearance of importance, and not a vastness worth retaining. The *x*'s, *y*'s, and *z*'s always do shrivel, as I have heard a learned friend say, whenever at the end of your algebraic computation they change into so many plain *a*'s, *b*'s, and *c*'s; – but the whole function of algebra is, after all, to get them into that more definite shape; and the whole function of philosophy ought to be to find out what definite difference it will make to you and me, at definite instants of our life, if this world-formula or that world-formula be the one which is true.

If we start off with an impossible case, we shall perhaps all the more clearly see the use and scope of our principle. Let us, therefore, put ourselves, in imagination, in a position from which no forecasts of consequence, no dictates of conduct, can possibly be made, so that the principle of pragmatism finds no field of application. Let us, I mean, assume that the present moment is the absolutely last moment of the world, with bare nonentity beyond it, and no hereafter for either experience or conduct.

Now I say that in that case there would be no sense whatever in some of our most urgent and envenomed philosophical and religious debates. The

question, "Is matter the producer of all things, or is a God there too?" would, for example, offer a perfectly idle and insignificant alternative if the world were finished and no more of it to come. Many of us, most of us, I think, now feel as if a terrible coldness and deadness would come over the world were we forced to believe that no informing spirit or purpose had to do with it, but it merely accidentally had come. The actually experienced details of fact might be the same on either hypothesis, some sad, some joyous; some rational, some odd and grotesque; but without a God behind them, we think they would have something ghastly, they would tell no genuine story, there would be no speculation in those eyes that they do glare with. With the God, on the other hand, they would grow solid, warm, and altogether full of real significance.

But I say that such an alternation of feelings, reasonable enough in a consciousness that is prospective, as ours now is, and whose world is partly yet to come, would be absolutely senseless and irrational in a purely retrospective consciousness summing up a world already past. For such a consciousness, no emotional interest could attach to the alternative. The problem would be purely intellectual; and if unaided matter could, with any scientific plausibility, be shown to cipher out the actual facts, then not the faintest shadow ought to cloud the mind, of regret for the God that by the same ciphering would prove needless and disappear from our belief.

For just consider the case sincerely, and say what would be the *worth* of such a God if he *were* there, with his work accomplished and his world run down. He would be worth no more than just that world was worth. To that amount of result, with its mixed merits and defects, his creative power could attain, but go no farther. And since there is to be no future; since the whole value and meaning of the world has been already paid in and actualized in the feelings that went with it in the passing, and now go with it in the ending; since it draws no supplemental significance (such as our real world draws) from its function of preparing something yet to come; why then, by it we take God's measure, as it were. He is the Being who could once for all do *that*; and for that much we are thankful to him, but for nothing more. But now, on the contrary hypothesis, namely, that the bits of matter following their "laws" could make that world and do no less, should we not be just as thankful to them? Wherein should we suffer loss, then, if we dropped God as an hypothesis and made the matter alone responsible? Where would the special deadness, "crassness," and ghastliness come in? And how, experience being what it is once for all, would God's presence in it make it any more "living," any richer in our sight?

Candidly, it is impossible to give any answer to this question. The actually experienced world is supposed to be the same in its details on either hypothesis, "the same, for our praise or blame," as Browning says. It stands there indefeasibly; a gift which can't be taken back. Calling matter the cause

of it retracts no single one of the items that have made it up, nor does calling God the cause augment them. They are the God or the atoms, respectively, of just that and no other world. The God, if there, has been doing just what atoms could do – appearing in the character of atoms, so to speak – and earning such gratitude as is due to atoms, and no more. If his presence lends no different turn or issue to the performance, it surely can lend it no increase of dignity. Nor would indignity come to it were he absent, and did the atoms remain the only actors on the stage. When a play is once over, and the curtain down, you really make it no better by claiming an illustrious genius for its author, just as you make it no worse by calling him a common hack.

Thus if no future detail of experience or conduct is to be deduced from our hypothesis, the debate between materialism and theism becomes quite idle and insignificant. Matter and God in that event mean exactly the same thing – the power, namely, neither more nor less, that can make just this mixed, imperfect, yet completed world – and the wise man is he who in such a case would turn his back on such a supererogatory discussion. Accordingly most men instinctively – and a large class of men, the so-called positivists or scientists, deliberately – do turn their backs on philosophical disputes from which nothing in the line of definite future consequences can be seen to follow. The verbal and empty character of our studies is surely a reproach with which you of the Philosophical Union are but too sadly familiar. An escaped Berkeley student said to me at Harvard the other day – he had never been in the philosophical department here – "Words, words, are all that you philosophers care for." We philosophers think it all unjust; and yet, if the principle of pragmatism be true, it is a perfectly sound reproach unless the metaphysical alternatives under investigation can be shown to have alternative practical outcomes, however delicate and distant these may be. The common man and the scientist can discover no such outcomes. And if the metaphysician can discern none either, the common man and scientist certainly are in the right of it, as against him. His science is then but pompous trifling; and the endowment of a professorship for such a being would be something really absurd.

Accordingly, in every genuine metaphysical debate some practical issue, however remote, is really involved. To realize this, revert with me to the question of materialism or theism; and place yourselves this time in the real world we live in, the world that has a future, that is yet uncompleted whilst we speak. In this unfinished world the alternative of "materialism or theism?" is intensely practical; and it is worth while for us to spend some minutes of our hour in seeing how truly this is the case.

How, indeed, does the programme differ for us, according as we consider that the facts of experience up to date are purposeless configurations of atoms moving according to eternal elementary laws, or that on the other hand they are due to the providence of God? As far as the past facts go, indeed there

is no difference. These facts are in, are bagged, are captured; and the good that's in them is gained, be the atoms or be the God their cause. There are accordingly many materialists about us to-day who, ignoring altogether the future and practical aspects of the question, seek to eliminate the odium attaching to the word materialism, and even to eliminate the word itself, by showing that, if matter could give birth to all these gains, why then matter, functionally considered, is just as divine an entity as God, in fact coalesces with God, is what you mean by God. Cease, these persons advise us, to use either of these terms, with their outgrown opposition. Use terms free of the clerical connotations on the one hand; of the suggestion of grossness, coarseness, ignobility, on the other. Talk of the primal mystery, of the unknowable energy, of the one and only power, instead of saying either God or matter. This is the course to which Mr. Spencer urges us at the end of the first volume of his Psychology. In some well-written pages he there shows us that a "matter" so infinitely subtile, and performing motions as inconceivably quick and fine as modern science postulates in her explanations, has no trace of grossness left. He shows that the conception of spirit, as we mortals hitherto have framed it, is itself too gross to cover the exquisite complexity of Nature's facts. Both terms, he says, are but symbols, pointing to that one unknowable reality in which their oppositions cease.

Throughout these remarks of Mr. Spencer, eloquent, and even noble in a certain sense, as they are, he seems to think that the dislike of the ordinary man to materialism comes from a purely aesthetic disdain of matter, as some thing gross in itself, and vile and despicable. Undoubtedly such aesthetic disdain of matter has played a part in philosophic history. But it forms no part whatever of an intelligent modern man's dislikes. Give him a matter bound forever by its laws to lead our world nearer and nearer to perfection, and any rational man will worship that matter as readily as Mr. Spencer worships his own so-called unknowable power. It not only has made for righteousness up to date, but it will make for righteousness forever; and that is all we need. Doing practically all that a God can do, it is equivalent to God, its function is a God's function, and in a world in which a God would be superfluous; from such a world a God could never lawfully be missed.

But *is* the matter by which Mr. Spencer's process of cosmic evolution is carried on any such principle of never-ending perfection as this? Indeed it is not, for the future end of every cosmically evolved thing or system of things is tragedy; and Mr. Spencer, in confining himself to the aesthetic and ignoring the practical side of the controversy, has really contributed nothing serious to its relief. But apply now our principle of practical results, and see what a vital significance the question of materialism or theism immediately acquires.

Theism and materialism, so indifferent when taken retrospectively, point when we take them prospectively to wholly different practical consequences, to opposite outlooks of experience. For, according to the theory of mechanical

evolution, the laws of redistribution of matter and motion, though they are certainly to thank for all the good hours which our organisms have ever yielded us and for all the ideals which our minds now frame, are yet fatally certain to undo their work again, and to redissolve everything that they have once evolved. You all know the picture of the last foreseeable state of the dead universe, as evolutionary science gives it forth. I cannot state it better than in Mr. Balfour's words: "The energies of our system will decay, the glory of the sun will be dimmed, and the earth, tideless and inert, will no longer tolerate the race which has for a moment disturbed its solitude. Man will go down into the pit, and all his thoughts will perish. The uneasy consciousness which in this obscure corner has for a brief space broken the contented silence of the universe, will be at rest. Matter will know itself no longer. 'Imperishable monuments' and 'immortal deeds', death itself, and love stronger than death, will be as if they had not been. Nor will anything that is, be better or worse for all that the labor, genius, devotion, and suffering of man have striven through countless ages to effect."[1]

That is the sting of it, that in the vast driftings of the cosmic weather, though many a jewelled shore appears, and many an enchanted cloud-bank floats away, long lingering ere it be dissolved – even as our world now lingers, for our joy – yet when these transient products are gone, nothing, absolutely *nothing* remains, to represent those particular qualities, those elements of preciousness which they may have enshrined. Dead and gone are they, gone utterly from the very sphere and room of being. Without an echo; without a memory; without an influence on aught that may come after, to make it care for similar ideals. This utter final wreck and tragedy is of the essence of scientific materialism as at present understood. The lower and not the higher forces are the eternal forces, or the last surviving forces within the only cycle of evolution which we can definitely see. Mr. Spencer believes this as much as anyone; so why should he argue with us as if we were making silly aesthetic objections to the "grossness" of "matter and motion" – the principles of his philosophy – when what really dismays us in it is the disconsolateness of its ulterior practical results?

No, the true objection to materialism is not positive but negative. It would be farcical at this day to make complaint of it for what it is, for "grossness." Grossness is what grossness *does* – we now know *that*. We make complaint of it, on the contrary, for what it is *not* – not a permanent warrant for our more ideal interests, not a fulfiller of our remotest hopes.

The notion of God, on the other hand, however inferior it may be in clearness to those mathematical notions so current in mechanical philosophy, has at least this practical superiority over them, that it guarantees an ideal

[1] *The Foundations of Belief*, p. 30.

order that shall be permanently preserved. A world with a God in it to say the last word, may indeed burn up or freeze, but we then think of Him as still mindful of the old ideals and sure to bring them elsewhere to fruition; so that, where He is, tragedy is only provisional and partial, and shipwreck and dissolution not the absolutely final things. This need of an eternal moral order is one of the deepest needs of our breast. And those poets, like Dante and Wordsworth, who live on the conviction of such an order, owe to that fact the extraordinary tonic and consoling power of their verse. Here then, in these different emotional and practical appeals, in these adjustments of our concrete attitudes of hope and expectation, and all the delicate consequences which their differences entail, lie the real meanings of materialism and theism – not in hair-splitting abstractions about matter's inner essence, or about the metaphysical attributes of God. Materialism means simply the denial that the moral order is eternal, and the cutting off of ultimate hopes; theism means the affirmation of an eternal moral order and the letting loose of hope. Surely here is an issue genuine enough, for any one who feels it; and, as long as men are men, it will yield matter for serious philosophic debate. Concerning this question, at any rate, the positivists and pooh-pooh-ers of metaphysics are in the wrong.

But possibly some of you may still rally to their defense. Even whilst admitting that theism and materialism make different prophecies of the world's future, you may your selves pooh-pooh the difference as something so infinitely remote as to mean nothing for a sane mind. The essence of a sane mind, you may say, is to take shorter views, and to feel no concern about such chimaeras as the latter end of the world. Well, I can only say that if you say this, you do injustice to human nature. Religious melancholy is not disposed of by a simple flourish of the word insanity. The absolute things, the last things, the overlapping things, are the truly philosophic concern; all superior minds feel seriously about them, and the mind with the shortest views is simply the mind of the more shallow man.

However, I am willing to pass over these very distant outlooks on the ultimate, if any of you so insist. The theistic controversy can still serve to illustrate the principle of pragmatism for us well enough, without driving us so far afield. If there be a God, it is not likely that he is confined solely to making differences in the world's latter end; he probably makes differences all along its course. Now the principle of practicalism says that the very meaning of the conception of God lies in those differences which must be made in our experience if the conception be true. God's famous inventory of perfections, as elaborated by dogmatic theology, either means nothing, says our principle, or it implies certain definite things that we can feel and do at particular moments of our lives, things which we could not feel and should not do were no God present and were the business of the universe carried on by material atoms instead. So far as our conceptions of the Deity involve no

such experiences, so far they are meaningless and verbal – scholastic entities and abstractions, as the positivists say, and fit objects for their scorn. But so far as they do involve such definite experiences, God means something for us, and may be real.

Now if we look at the definitions of God made by dogmatic theology, we see immediately that some stand and some fall when treated by this test. God, for example, as any orthodox text-book will tell us, is a being existing not only *per se*, or by himself, as created beings exist, but *a se*, or from himself; and out of this "aseity" flow most of his perfections. He is, for example, necessary; absolute; infinite in all respects; and single. He is simple, not compounded of essence and existence, substance and accident, actuality and potentiality, or subject and attributes, as are other things. He belongs to no genus; he is inwardly and outwardly unalterable; he knows and wills all things, and first of all his own infinite self, in one indivisible eternal act. And he is absolutely self-sufficing, and infinitely happy. – Now in which one of us practical Americans here assembled does this conglomeration of attributes awaken any sense of reality? And if in no one, then why not? Surely because such attributes awaken no responsive active feelings and call for no particular conduct of our own. How does God's "aseity" come home to *you?* What specific thing can I do to adapt myself to his "simplicity"? Or how determine our behavior henceforward if his "felicity" is anyhow absolutely complete? In the '50's and '60's Captain Mayne Reid was the great writer of boys' books of out-of-door adventure. He was forever extolling the hunters and field-observers of living animals' habits, and keeping up a fire of invective against the "closet-naturalists," as he called them, the collectors and classifiers, and handlers of skeletons and skins. When I was a boy I used to think that a closet-naturalist must be the vilest type of wretch under the sun. But surely the systematic theologians are the closet-naturalists of the Deity, even in Captain Mayne Reid's sense. Their orthodox deduction of God's attributes is nothing but a shuffling and matching of pedantic dictionary-adjectives, aloof from morals, aloof from human needs, something that might be worked out from the mere word "God" by a logical machine of wood and brass as well as by a man of flesh and blood. The attributes which I have quoted have absolutely nothing to do with religion, for religion is a living practical affair. Other parts, indeed, of God's traditional description do have practical connection with life, and have owed all their historic importance to that fact. His omniscience, for example, and his justice. With the one he sees us in the dark, with the other he rewards and punishes what he sees. So do his ubiquity and eternity and unalterability appeal to our confidence, and his goodness banish our fears. Even attributes of less meaning to this present audience have in past times so appealed. One of the chief attributes of God, according to the orthodox theology, is his infinite love of himself, proved by asking the question, "By what but an infinite object can an infinite affection be appeased?" An

immediate consequence of this primary self-love of God is the orthodox dogma that the manifestation of his own glory is God's primal purpose in creation; and that dogma has certainly made very efficient practical connection with life. It is true that we ourselves are tending to outgrow this old monarchical conception of a Deity with his "court" and pomp – "his state is kingly, thousands at his bidding speed," etc. – but there is no denying the enormous influence it has had over ecclesiastical history, nor, by repercussion, over the history of European states. And yet even these more real and significant attributes have the trail of the serpent over them as the books on theology have actually worked them out. One feels that, in the theologians' hands, they are only a set of dictionary-adjectives, mechanically deduced; logic has stepped into the place of vision, professionalism into that of life. Instead of bread we get a stone; instead of a fish, a serpent. Did such a conglomeration of abstract general terms give really the gist of our knowledge of the Deity, divinity-schools might indeed continue to flourish, but religion, vital religion, would have taken its flight from this world. What keeps religion going is something else than abstract definitions and systems of logically concatenated adjectives, and something different from faculties of theology and their professors. All these things are after-effects, secondary accretions upon a mass of concrete religious experiences, connecting themselves with feeling and conduct that renew themselves *in saecula saeculorum* in the lives of humble private men. If you ask what these experiences are, they are conversations with the unseen, voices and visions, responses to prayer, changes of heart, deliverances from fear, inflowings of help, assurances of support, whenever certain persons set their own internal attitude in certain appropriate ways. The power comes and goes and is lost, and can be found only in a certain definite direction, just as if it were a concrete material thing. These direct experiences of a wider spiritual life, with which our superficial consciousness is continuous, and with which it keeps up an intense commerce, form the primary mass of direct religious experience on which all hearsay religion rests, and which furnishes that notion of an ever-present God, out of which systematic theology thereupon proceeds to make capital in its own unreal pedantic way. What the word "God" means is just those passive and active experiences of your life. Now, my friends, it is quite immaterial to my purpose whether yourselves enjoy and venerate these experiences, or whether you stand aloof and, viewing them in others, suspect them of being illusory and vain. Like all other human experiences, they too certainly share in the general liability to illusion and mistake. They need not be infallible. But they are certainly the originals of the God-idea, and theology is the translation; and you remember that I am now using the God-idea merely as an example, not to discuss as to its truth or error, but only to show how well the principle of pragmatism works. That the God of systematic theology should exist or not exist is a matter of small practical moment. At most it means that you may

continue uttering certain abstract words and that you must stop using others. But if the God of these particular experiences be false, it is an awful thing for you, if you are one of those whose lives are stayed on such experiences. The theistic controversy, trivial enough if we take it merely academically and theologically, is of tremendous significance if we test it by its results for actual life.

I can best continue to recommend the principle of practicalism to you by keeping in the neighborhood of this theological idea. I reminded you a few minutes ago that the old monarchical notion of the Deity as a sort of Louis the Fourteenth of the Heavens is losing nowadays much of its ancient prestige. Religious philosophy, like all philosophy, is growing more and more idealistic. And in the philosophy of the Absolute, so called, that post-Kantian form of idealism which is carrying so many of our higher minds before it, we have the triumph of what in old times was summarily disposed of as the pantheistic heresy – I mean the conception of God, not as the extraneous creator, but as the indwelling spirit and substance of the world. I know not where one can find a more candid, more clear, or, on the whole, more persuasive statement of this theology of Absolute Idealism than in the addresses made before this very Union three years ago by your own great Californian philosopher (whose colleague at Harvard I am proud to be), Josiah Royce. His contributions to the resulting volume, *The Conception of God*, form a very masterpiece of popularization. Now you will remember, many of you, that in the discussion that followed Professor Royce's first address, the debate turned largely on the ideas of unity and plurality, and on the question whether, if God be One in All and All in All, "One with the unity of a single instant," as Royce calls it, "forming in His wholeness one luminously transparent moment," any room is left for real morality or freedom. Professor Howison, in particular, was earnest in urging that morality and freedom are relations between a manifold of selves, and that under the régime of Royce's monistic Absolute Thought "no true manifold of selves is or can be provided for." I will not go into any of the details of that particular discussion, but just ask you to consider for a moment whether, in general, any discussion about monism or pluralism, any argument over the unity of the universe, would not necessarily be brought into a shape where it tends to straighten itself out, by bringing our principle of practical results to bear.

The question whether the world is at bottom One or Many is a typical metaphysical question. Long has it raged! In its crudest form it is an exquisite example of the *loggerheads* of metaphysics. "I say it is one great fact," Parmenides and Spinoza exclaim. "I say it is many little facts," reply the atomists and associationists. "I say it is both one and many, many in one," say the Hegelians; and in the ordinary popular discussions we rarely get beyond this barren reiteration by the disputants of their pet adjectives of number. But is it not first of all clear that when we take such an adjective as

"One" absolutely and abstractly, its meaning is so vague and empty that it makes no difference whether we affirm or deny it? Certainly this universe is not the mere number One; and yet you can number it "one," if you like, in talking about it as contrasted with other possible worlds numbered "two" and "three" for the occasion. What exact thing do you *practically* mean by "One," when you call the universe One, is the first question you must ask. In what ways does the oneness come home to your own personal life? By what difference does it express itself in your experience? How can you act differently towards a universe which is one? Inquired into in this way, the unity might grow clear and be affirmed in some ways and denied in others, and so cleared up, even though a certain vague and worshipful portentousness might disappear from the notion of it in the process.

For instance, one practical result that follows when we have one thing to handle, is that we can pass from one part of it to another without letting go of the thing. In this sense oneness must be partly denied and partly affirmed of our universe. Physically we can pass continuously in various manners from one part of it to another part. But logically and psychically the passage seems less easy, for there is no obvious transition from one mind to another, or from minds to physical things. You have to step off and get on again; so that in these ways the world is not one, as measured by that practical test.

Another practical meaning of oneness is susceptibility of collection. A collection is one, though the things that compose it be many. Now, can we practically "collect" the universe? Physically, of course we cannot. And mentally we cannot, if we take it concretely in its details. But if we take it summarily and abstractly, then we collect it mentally whenever we refer to it, even as I do now when I fling the term "universe" at it, and so seem to leave a mental ring around it. It is plain, however, that such abstract noetic unity (as one might call it) is practically an extremely insignificant thing.

Again, oneness may mean generic sameness, so that you can treat all parts of the collection by one rule and get the same results. It is evident that in this sense the oneness of our world is incomplete, for in spite of much generic sameness in its elements and items, they still remain of many irreducible kinds. You can't pass by mere logic all over the field of it.

Its elements have, however, an affinity or commensurability with each other, are not wholly irrelevant, but can be compared, and fit together after certain fashions. This again might practically mean that they were one *in origin*, and that, tracing them backwards, we should find them arising in a single primal causal fact. Such unity of origin would have definite practical consequences, would have them for our scientific life at least.

I can give only these hasty superficial indications of what I mean when I say that it tends to clear up the quarrel between monism and pluralism to subject the notion of unity to such practical tests. On the other hand, it does but perpetuate strife and misunderstanding to continue talking of it in an

absolute and mystical way. I have little doubt myself that this old quarrel might be completely smoothed out to the satisfaction of all claimants, if only the maxim of Peirce were methodically followed here. The current monism on the whole still keeps talking in too abstract a way. It says the world must be either pure disconnectedness, no universe at all, or absolute unity. It insists that there is no stopping-place half way. Any connection whatever, says this monism, is only possible if there be still more connection, until at last we are driven to admit the absolutely total connection required. But this absolutely total connection either means nothing, is the mere word "one" spelt long; or else it means the sum of all the partial connections that can possibly be conceived. I believe that when we thus attack the question, and set ourselves to search for these possible connections, and conceive each in a definite practical way, the dispute is already in a fair way to be settled beyond the chance of misunderstanding, by a compromise in which the Many and the One both get their lawful rights.

But I am in danger of becoming technical; so I must stop right here, and let you go.

I am happy to say that it is the English-speaking philosophers who first introduced the custom of interpreting the meaning of conceptions by asking what difference they make for life. Mr. Peirce has only expressed in the form of an explicit maxim what their sense for reality led them all instinctively to do. The great English way of investigating a conception is to ask yourself right off, "What is it *known as?* In what facts does it result? What is its *cash-value*, in terms of particular experience? and what special difference would come into the world according as it were true or false?" Thus does Locke treat the conception of personal identity. What you mean by it is just your chain of memories, says be. That is the only concretely verifiable part of its significance. All further ideas about it, such as the oneness or manyness of the spiritual substance on which it is based, are therefore void of intelligible meaning; and propositions touching such ideas may be indifferently affirmed or denied. So Berkeley with his "matter" The cash-value of matter is our physical sensations. That is what it is known as, all that we concretely verify of its conception. That therefore is the whole meaning of the word "matter" – any other pretended meaning is mere wind of words. Hume does the same thing with causation. It is known as habitual antecedence, and tendency on our part to look for something definite to come. Apart from this practical meaning it has no significance whatever, and books about it may be committed to the flames, says Hume. Stewart and Brown, James Mill, John Mill, and Bain, have followed more or less consistently the same method; and Shadworth Hodgson has used it almost as explicitly as Mr. Peirce. These writers have many of them no doubt been too sweeping in their negations; Hume, in particular, and James Mill, and Bain. But when all is said and done, it was they, not Kant, who introduced "the critical method" into philosophy,

the one method fitted to make philosophy a study worthy of serious men. For what seriousness can possibly remain in debating philosophic propositions that will never make an appreciable difference to us in action? And what matters it, when all propositions are practically meaningless, which of them be called true or false?

The shortcomings and the negations and baldnesses of the English philosophers in question come, not from their eye to merely practical results, but solely from their failure to track the practical results completely enough to see how far they extend. Hume can be corrected and built out, and his beliefs enriched, by using Humian principles exclusively, and without making any use of the circuitous and ponderous artificialities of Kant. It is indeed a some what pathetic matter, as it seems to me, that this is not the course which the actual history of philosophy has followed. Hume had no English successors of adequate ability to complete him and correct his negations; so it happened, as a matter of fact, that the building out of critical philosophy has mainly been left to thinkers who were under the influence of Kant. Even in England and this country it is with Kantian catch-words and categories that the fuller view of life is pursued, and in our universities it is the courses in transcendentalism that kindle the enthusiasm of the more ardent students, whilst the courses in English philosophy are committed to a secondary place. I cannot think that this is exactly as it should be. And I say this not out of jingoism, for jingoism has no place in philosophy; or out of excitement over the great Anglo-American alliance against the world, of which we nowadays hear so much – though heaven knows that to that alliance I wish a God-speed. I say it because I sincerely believe that the English spirit in philosophy is intellectually, as well as practically and morally, on the saner, sounder, and truer path. Kant's mind is the rarest and most intricate of all possible antique bric-a-brac museums, and connoisseurs and dilettanti will always wish to visit it and see the wondrous and racy contents. The temper of the dear old man about his work is perfectly delectable. And yet he is really – although I shrink with some terror from saying such a thing before some of you here present – at bottom a mere curio, a "specimen." I mean by this a perfectly definite thing: I believe that Kant bequeathes to us not one single conception which is both indispensable to philosophy and which philosophy either did not possess before him, or was not destined inevitably to acquire after him through the growth of men's reflection upon the hypothesis by which science interprets nature. The true line of philosophic progress lies, in short, it seems to me, not so much *through* Kant as *round* him to the point where now we stand. Philosophy can perfectly well outflank him, and build herself up into adequate fullness by prolonging more directly the older English lines.

May I hope, as I now conclude, and release your attention from the strain to which you have so kindly put it on my behalf, that on this wonderful

Pacific Coast, of which our race is taking possession, the principle of practicalism, in which I have tried so hard to interest you, and with it the whole English tradition in philosophy, will come to its rights, and in your hands help the rest of us in our struggle towards the light.

PRAGMATISM

William James, "Pragmatism." *Dictionary of Philosophy and Psychology*, ed. James Mark Baldwin (New York: Macmillan, 1902), vol. 2, pp. 321.

The doctrine that the whole 'meaning' of a conception expresses itself in practical consequences, consequences either in the shape of conduct to be recommended, or in that of experiences to be expected, if the conception be true; which consequences would be different were it untrue, and must be different from the consequences by which the meaning of other conceptions in is turn expressed. If a second conception should not appear to have other consequences, then it must really be only the first conception under a different name. In methodology it is certain that to trace and compare their respective consequences is an admirable way of establishing the different meanings of different conceptions.

WHAT PRAGMATISM MEANS

William James, "What Pragmatism Means." *Pragmatism: A New Name for Some Old Ways of Thinking* (New York: Longmans, Green and Co., 1907), chap. 2, pp. 43–81.

Some years ago, being with a camping party in the mountains, I returned from a solitary ramble to find everyone engaged in a ferocious metaphysical dispute. The *corpus* of the dispute was a squirrel – a live squirrel supposed to be clinging to one side of a tree-trunk; while over against the tree's opposite side a human being was imagined to stand. This human witness tries to get sight of the squirrel by moving rapidly round the tree, but no matter how fast he goes, the squirrel moves as fast in the opposite direction, and always keeps the tree between himself and the man, so that never a glimpse of him is caught. The resultant metaphysical problem now is this: *Does the man go round the squirrel or not?* He goes round the tree, sure enough, and the squirrel is on the tree; but does he go round the squirrel? In the unlimited leisure of the wilderness, discussion had been worn threadbare. Everyone had taken sides, and was obstinate; and the numbers on both sides were even. Each side, when I appeared, therefore appealed to me to make it a majority. Mindful of the scholastic adage that whenever you meet a contradiction you must make a distinction, I immediately sought and found one, as follows: "Which party is right," I said, "depends on what you *practically mean* by 'going round' the squirrel. If you mean passing from the north of him to the east, then to the south, then to the west, and then to the north of him again, obviously the man does go round him, for he occupies these successive positions. But if on the contrary you mean being first in front of him, then on the right of him, then behind him, then on his left, and finally in front again, it is quite as obvious that the man fails to go round him, for by the compensating movements the squirrel makes, he keeps his belly turned towards the man all the time, and his back turned away. Make the distinction, and there is no occasion for any farther dispute. You are both right and both wrong according as you conceive the verb 'to go round' in one practical fashion or the other."

Altho one or two of the hotter disputants called my speech a shuffling evasion, saying they wanted no quibbling or scholastic hair-splitting, but meant just plain honest English 'round', the majority seemed to think that the distinction had assuaged the dispute.

I tell this trivial anecdote because it is a peculiarly simple example of what I wish now to speak of as *the pragmatic method*. The pragmatic method is primarily a method of settling metaphysical disputes that otherwise might be interminable. Is the world one or many? – fated or free? – material or spiritual? – here are notions either of which may or may not hold good of the world; and disputes over such notions are unending. The pragmatic method in such cases is to try to interpret each notion by tracing its respective practical consequences. What difference would it practically make to anyone if this notion rather than that notion were true? If no practical difference whatever can be traced, then the alternatives mean practically the same thing, and all dispute is idle. Whenever a dispute is serious, we ought to be able to show some practical difference that must follow from one side or the other's being right.

A glance at the history of the idea will show you still better what pragmatism means. The term is derived from the same Greek word πράγμα, meaning action, from which our words 'practice' and 'practical' come. It was first introduced into philosophy by Mr. Charles Peirce in 1878. In an article entitled "How to Make Our Ideas Clear," in the *Popular Science Monthly* for January of that year[1] Mr. Peirce, after pointing out that our beliefs are really rules for action, said that, to develop a thought's meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance. And the tangible fact at the root of all our thought-distinctions, however subtle, is that there is no one of them so fine as to consist in anything but a possible difference of practice. To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve – what sensations we are to expect from it, and what reactions we must prepare. Our conception of these effects, whether immediate or remote, is then for us the whole of our conception of the object, so far as that conception has positive significance at all.

This is the principle of Peirce, the principle of pragmatism. It lay entirely unnoticed by anyone for twenty years, until I, in an address before Professor Howison's philosophical union at the University of California, brought it forward again and made a special application of it to religion. By that date (1898) the times seemed ripe for its reception. The word 'pragmatism' spread, and at present it fairly spots the pages of the philosophic journals. On all hands we find the 'pragmatic movement' spoken of, sometimes with respect, sometimes with contumely, seldom with clear understanding. It is evident that the term applies itself conveniently to a number of tendencies that hitherto have lacked a collective name, and that it has 'come to stay'.

To take in the importance of Peirce's principle, one must get accustomed to applying it to concrete cases. I found a few years ago that Ostwald, the illus-

[1] Translated in the *Revue Philosophique* for January, 1879 (vol. vii).

trious Leipzig chemist, had been making perfectly distinct use of the principle of pragmatism in his lectures on the philosophy of science, tho he had not called it by that name.

"All realities influence our practice," he wrote me, "and that influence is their meaning for us. I am accustomed to put questions to my classes in this way: In what respects would the world be different if this alternative or that were true? If I can find nothing that would become different, then the alternative has no sense."

That is, the rival views mean practically the same thing, and meaning, other than practical, there is for us none. Ostwald in a published lecture gives this example of what he means. Chemists have long wrangled over the inner constitution of certain bodies called 'tautomerous'. Their properties seemed equally consistent with the notion that an instable hydrogen atom oscillates inside of them, or that they are instable mixtures of two bodies. Controversy raged; but never was decided. "It would never have begun," says Ostwald, "if the combatants had asked themselves what particular experimental fact could have been made different by one or the other view being correct. For it would then have appeared that no difference of fact could possibly ensue; and the quarrel was as unreal as if, theorizing in primitive times about the raising of dough by yeast, one party should have invoked a 'brownie', while another insisted on an 'elf' as the true cause of the phenomenon."[2]

It is astonishing to see how many philosophical disputes collapse into insignificance the moment you subject them to this simple test of tracing a concrete consequence. There can *be* no difference anywhere that doesn't *make* a difference elsewhere – no difference in abstract truth that doesn't express itself in a difference in concrete fact and in conduct consequent upon that fact, imposed on somebody, somehow, somewhere and somewhen. The whole function of philosophy ought to be to find out what definite difference it will make to you and me, at definite instants of our life, if this world-formula or that world-formula be the true one.

There is absolutely nothing new in the pragmatic method. Socrates was an adept at it. Aristotle used it methodically. Locke, Berkeley and Hume made momentous contributions to truth by its means. Shadworth Hodgson keeps insisting that realities are only what they are 'known-as'. But these forerunners of pragmatism used it in fragments: they were preluders only. Not until in our time has it generalized itself, become conscious of a universal mission,

[2] "Theorie und Praxis," *Zeitsch. des Oesterreichischen Ingenieur u. Architecten-Vereines*, 1905, Nr. 4 u. 6. I find a still more radical pragmatism than Ostwald's in an address by Professor W. S. Franklin: "I think that the sickliest notion of physics, even if a student gets it, is that it is 'the science of masses, molecules and the ether.' And I think that the healthiest notion, even if a student does not wholly get it, is that physics is the science of the ways of taking hold of bodies and pushing them!" (*Science*, January 2, 1903.)

pretended to a conquering destiny. I believe in that destiny, and I hope I may end by inspiring you with my belief.

Pragmatism represents a perfectly familiar attitude in philosophy, the empiricist attitude, but it represents it, as it seems to me, both in a more radical and in a less objectionable form than it has ever yet assumed. A pragmatist turns his back resolutely and once for all upon a lot of inveterate habits dear to professional philosophers. He turns away from abstraction and insufficiency, from verbal solutions, from bad *a priori* reasons, from fixed principles, closed systems, and pretended absolutes and origins. He turns towards concreteness and adequacy, towards facts, towards action, and towards power. That means the empiricist temper regnant, and the rationalist temper sincerely given up. It means the open air and possibilities of nature, as against dogma, artificiality and the pretence of finality in truth.

At the same time it does not stand for any special results. It is a method only. But the general triumph of that method would mean an enormous change in what I called in my last lecture the 'temperament' of philosophy. Teachers of the ultra-rationalistic type would be frozen out, much as the courtier type is frozen out in republics, as the ultramontane type of priest is frozen out in protestant lands. Science and metaphysics would come much nearer together, would in fact work absolutely hand in hand.

Metaphysics has usually followed a very primitive kind of quest. You know how men have always hankered after unlawful magic, and you know what a great part, in magic, *words* have always played. If you have his name, or the formula of incantation that binds him, you can control the spirit, genie, afrite, or whatever the power may be. Solomon knew the names of all the spirits, and having their names, he held them subject to his will. So the universe has always appeared to the natural mind as a kind of enigma, of which the key must be sought in the shape of some illuminating or power-bringing word or name. That word names the universe's *principle*, and to possess it is, after a fashion, to possess the universe itself. 'God', 'Matter', 'Reason', 'the Absolute', 'Energy', are so many solving names. You can rest when you have them. You are at the end of your metaphysical quest.

But if you follow the pragmatic method, you cannot look on any such word as closing your quest. You must bring out of each word its practical cash-value, set it at work within the stream of your experience. It appears less as a solution, then, than as a program for more work, and more particularly as an indication of the ways in which existing realities may be *changed*.

Theories thus become instruments, not answers to enigmas, in which we can rest. We don't lie back upon them, we move forward, and, on occasion, make nature over again by their aid. Pragmatism unstiffens all our theories, limbers them up and sets each one at work. Being nothing essentially new, it harmonizes with many ancient philosophic tendencies. It agrees with nominalism for instance, in always appealing to particulars; with utilitari-

anism in emphasizing practical aspects; with positivism in its disdain for verbal solutions, useless questions, and metaphysical abstractions.

All these, you see, are *anti-intellectualist* tendencies. Against rationalism as a pretension and a method, pragmatism is fully armed and militant. But, at the outset, at least, it stands for no particular results. It has no dogmas, and no doctrines save its method. As the young Italian pragmatist Papini has well said, it lies in the midst of our theories, like a corridor in a hotel. Innumerable chambers open out of it. In one you may find a man writing an atheistic volume; in the next someone on his knees praying for faith and strength; in a third a chemist investigating a body's properties. In a fourth a system of idealistic metaphysics is being excogitated; in a fifth the impossibility of metaphysics is being shown. But they all own the corridor, and all must pass through it if they want a practicable way of getting into or out of their respective rooms.

No particular results then, so far, but only an attitude of orientation, is what the pragmatic method means. The attitude of *looking away from first things, principles, 'categories', supposed necessities; and of looking towards last things, fruits, consequences, facts*.

So much for the pragmatic method! You may say that I have been praising it rather than explaining it to you, but I shall presently explain it abundantly enough by showing how it works on some familiar problems. Meanwhile the word pragmatism has come to be used in a still wider sense, as meaning also a certain *theory of truth*. I mean to give a whole lecture to the statement of that theory, after first paving the way, so I can be very brief now. But brevity is hard to follow, so I ask for your redoubled attention for a quarter of an hour. If much remains obscure, I hope to make it clearer in the later lectures.

One of the most successfully cultivated branches of philosophy in our time is what is called inductive logic, the study of the conditions under which our sciences have evolved. Writers on this subject have begun to show a singular unanimity as to what the laws of nature and elements of fact mean, when formulated by mathematicians, physicists and chemists. When the first mathematical, logical and natural uniformities, the first *laws*, were discovered, men were so carried away by the clearness, beauty and simplification that resulted, that they believed themselves to have deciphered authentically the eternal thoughts of the Almighty. His mind also thundered and reverberated in syllogisms. He also thought in conic sections, squares and roots and ratios, and geometrized like Euclid. He made Kepler's laws for the planets to follow; he made velocity increase proportionally to the time in falling bodies; he made the law of the sines for light to obey when refracted; he established the classes, orders, families and genera of plants and animals, and fixed the distances between them. He thought the archetypes of all things, and devised their variations; and when we rediscover any one of these his wondrous institutions, we seize his mind in its very literal intention.

But as the sciences have developed farther, the notion has gained ground that most, perhaps all, of our laws are only approximations. The laws themselves, moreover, have grown so numerous that there is no counting them; and so many rival formulations are proposed in all the branches of science that investigators have become accustomed to the notion that no theory is absolutely a transcript of reality, but that any one of them may from some point of view be useful. Their great use is to summarize old facts and to lead to new ones. They are only a man-made language, a conceptual shorthand, as someone calls them, in which we write our reports of nature; and languages, as is well known, tolerate much choice of expression and many dialects.

Thus human arbitrariness has driven divine necessity from scientific logic. If I mention the names of Sigwart, Mach, Ostwald, Pearson, Milhaud, Poincaré, Duhem, Ruyssen, those of you who are students will easily identify the tendency I speak of, and will think of additional names.

Riding now on the front of this wave of scientific logic Messrs. Schiller and Dewey appear with their pragmatistic account of what truth everywhere signifies. Everywhere, these teachers say, 'truth' in our ideas and beliefs means the same thing that it means in science. It means, they say, nothing but this, *that ideas (which themselves are but parts of our experience) become true just in so far as they help us to get into satisfactory relation with other parts of our experience*, to summarize them and get about among them by conceptual short-cuts instead of following the interminable succession of particular phenomena. Any idea upon which we can ride, so to speak; any idea that will carry us prosperously from any one part of our experience to any other part, linking things satisfactorily, working securely, simplifying, saving labor; is true for just so much, true in so far forth, true *instrumentally*. This is the 'instrumental' view of truth taught so successfully at Chicago, the view that truth in our ideas means their power to 'work', promulgated so brilliantly at Oxford.

Messrs. Dewey, Schiller and their allies, in reaching this general conception of all truth, have only followed the example of geologists, biologists and philologists. In the establishment of these other sciences, the successful stroke was always to take some simple process actually observable in operation – as denudation by weather, say, or variation from parental type, or change of dialect by incorporation of new words and pronunciations – and then to generalize it, making it apply to all times, and produce great results by summating its effects through the ages.

The observable process which Schiller and Dewey particularly singled out for generalization is the familiar one by which any individual settles into *new opinions*. The process here is always the same. The individual has a stock of old opinions already, but he meets a new experience that puts them to a strain. Somebody contradicts them; or in a reflective moment he discovers that they contradict each other; or he hears of facts with which they are incompatible;

or desires arise in him which they cease to satisfy. The result is an inward trouble to which his mind till then had been a stranger, and from which he seeks to escape by modifying his previous mass of opinions. He saves as much of it as he can, for in this matter of belief we are all extreme conservatives. So he tries to change first this opinion, and then that (for they resist change very variously), until at last some new idea comes up which he can graft upon the ancient stock with a minimum of disturbance of the latter, some idea that mediates between the stock and the new experience and runs them into one another most felicitously and expediently.

This new idea is then adopted as the true one. It preserves the older stock of truths with a minimum of modification, stretching them just enough to make them admit the novelty, but conceiving that in ways as familiar as the case leaves possible. An *outrée* explanation, violating all our preconceptions, would never pass for a true account of a novelty. We should scratch round industriously till we found something less excentric. The most violent revolutions in an individual's beliefs leave most of his old order standing. Time and space, cause and effect, nature and history, and one's own biography remain untouched. New truth is always a go-between, a smoother-over of transitions. It marries old opinion to new fact so as ever to show a minimum of jolt, a maximum of continuity. We hold a theory true just in proportion to its success in solving this 'problem of maxima and minima'. But success in solving this problem is eminently a matter of approximation. We say this theory solves it on the whole more satisfactorily than that theory; but that means more satisfactorily to ourselves, and individuals will emphasize their points of satisfaction differently. To a certain degree, therefore, everything here is plastic.

The point I now urge you to observe particularly is the part played by the older truths. Failure to take account of it is the source of much of the unjust criticism leveled against pragmatism. Their influence is absolutely controlling. Loyalty to them is the first principle – in most cases it is the only principle; for by far the most usual way of handling phenomena so novel that they would make for a serious rearrangement of our preconceptions is to ignore them altogether, or to abuse those who bear witness for them.

You doubtless wish examples of this process of truth's growth, and the only trouble is their superabundance. The simplest case of new truth is of course the mere numerical addition of new kinds of facts, or of new single facts of old kinds, to our experience – an addition that involves no alteration in the old beliefs. Day follows day, and its contents are simply added. The new contents themselves are not true, they simply *come* and *are*. Truth is *what we say about* them, and when we say that they have come, truth is satisfied by the plain additive formula.

But often the day's contents oblige a rearrangement. If I should now utter piercing shrieks and act like a maniac on this platform, it would make many

of you revise your ideas as to the probable worth of my philosophy. 'Radium' came the other day as part of the day's content, and seemed for a moment to contradict our ideas of the whole order of nature, that order having come to be identified with what is called the conservation of energy. The mere sight of radium paying heat away indefinitely out of its own pocket seemed to violate that conservation. What to think? If the radiations from it were nothing but an escape of unsuspected 'potential' energy, pre-existent inside of the atoms, the principle of conservation would be saved. The discovery of 'helium' as the radiation's outcome, opened a way to this belief So Ramsay's view is generally held to be true, because, altho it extends our old ideas of energy, it causes a minimum of alteration in their nature.

I need not multiply instances. A new opinion counts as 'true' just in proportion as it gratifies the individual's desire to assimilate the novel in his experience to his beliefs in stock. It must both lean on old truth and grasp new fact; and its success (as I said a moment ago) in doing this, is a matter for the individual's appreciation. When old truth grows, then, by new truth's addition, it is for subjective reasons. We are in the process and obey the reasons. That new idea is truest which performs most felicitously its function of satisfying our double urgency. It makes itself true, gets itself classed as true, by the way it works; grafting itself then upon the ancient body of truth, which thus grows much as a tree grows by the activity of a new layer of cambium.

Now Dewey and Schiller proceed to generalize this observation and to apply it to the most ancient parts of truth. They also once were plastic. They also were called true for human reasons. They also mediated between still earlier truths and what in those days were novel observations. Purely objective truth, truth in whose establishment the function of giving human satisfaction in marrying previous parts of experience with newer parts played no rôle whatever, is nowhere to be found. The reasons why we call things true is the reason why they *are* true, for 'to be true' *means* only to perform this marriage-function.

The trail of the human serpent is thus over everything. Truth independent; truth that we *find* merely; truth no longer malleable to human need; truth incorrigible, in a word; such truth exists indeed superabundantly – or is supposed to exist by rationalistically minded thinkers; but then it means only the dead heart of the living tree, and its being there means only that truth also has its paleontology and its 'prescription', and may grow stiff with years of veteran service and petrified in men's regard by sheer antiquity. But how plastic even the oldest truths nevertheless really are has been vividly shown in our day by the transformation of logical and mathematical ideas, a transformation which seems even to be invading physics. The ancient formulas are reinterpreted as special expressions of much wider principles, principles that our ancestors never got a glimpse of in their present shape and formulation.

Mr. Schiller still gives to all this view of truth the name of 'Humanism', but, for this doctrine too, the name of pragmatism seems fairly to be in the ascendant, so I will treat it under the name of pragmatism in these lectures.

Such then would be the scope of pragmatism – first, a method; and second, a genetic theory of what is meant by truth. And these two things must be our future topics.

What I have said of the theory of truth will, I am sure, have appeared obscure and unsatisfactory to most of you by reason of its brevity. I shall make amends for that hereafter. In a lecture on 'common sense' I shall try to show what I mean by truths grown petrified by antiquity. In another lecture I shall expatiate on the idea that our thoughts become true in proportion as they successfully exert their go-between function. In a third I shall show how hard it is to discriminate subjective from objective factors in Truth's development. You may not follow me wholly in these lectures; and if you do, you may not wholly agree with me. But you will, I know, regard me at least as serious, and treat my effort with respectful consideration.

You will probably be surprised to learn, then, that Messrs. Schiller's and Dewey's theories have suffered a hailstorm of contempt and ridicule. All rationalism has risen against them. In influential quarters Mr. Schiller, in particular, has been treated like an impudent schoolboy who deserves a spanking. I should not mention this, but for the fact that it throws so much sidelight upon that rationalistic temper to which I have opposed the temper of pragmatism. Pragmatism is uncomfortable away from facts. Rationalism is comfortable only in the presence of abstractions. This pragmatist talk about truths in the plural, about their utility and satisfactoriness, about the success with which they 'work', etc., suggests to the typical intellectualist mind a sort of coarse lame second-rate makeshift article of truth, Such truths are not real truth. Such tests are merely subjective. As against this, objective truth must be something non-utilitarian, haughty, refined, remote, august, exalted. It must be an absolute correspondence of our thoughts with an equally absolute reality. It must be what we *ought* to think, unconditionally. The conditioned ways in which we *do* think are so much irrelevance and matter for psychology. Down with psychology, up with logic, in all this question!

See the exquisite contrast of the types of mind! The pragmatist clings to facts and concreteness, observes truth at its work in particular cases, and generalizes. Truth, for him, becomes a class-name for all sorts of definite working-values in experience. For the rationalist it remains a pure abstraction, to the bare name of which we must defer. When the pragmatist undertakes to show in detail just *why* we must defer, the rationalist is unable to recognize the concretes from which his own abstraction is taken. He accuses us of *denying* truth; whereas we have only sought to trace exactly why people follow it and always ought to follow it. Your typical ultra-abstractionist fairly shudders at concreteness: other things equal, he positively prefers the pale and spectral.

If the two universes were offered, he would always choose the skinny outline rather than the rich thicket of reality. It is so much purer, clearer, nobler.

I hope that as these lectures go on, the concreteness and closeness to facts of the pragmatism which they advocate may be what approves itself to you as its most satisfactory peculiarity. It only follows here the example of the sister-sciences, interpreting the unobserved by the observed. It brings old and new harmoniously together. It converts the absolutely empty notion of a static relation of 'correspondence' (what that may mean we must ask later) between our minds and reality, into that of a rich and active commerce (that anyone may follow in detail and understand) between particular thoughts of ours, and the great universe of other experiences in which they play their parts and have their uses.

But enough of this at present? The justification of what I say must be postponed. I wish now to add a word in further explanation of the claim I made at out last meeting, that pragmatism may be a happy harmonizer of empiricist ways of thinking, with the more religious demands of human beings.

Men who are strongly of the fact-loving temperament, you may remember me to have said, are liable to be kept at a distance by the small sympathy with facts which that philosophy from the present-day fashion of idealism offers them. It is far too intellectualistic. Old fashioned theism was bad enough, with its notion of God as an exalted monarch, made up of a lot of unintelligible or preposterous 'attributes'; but, so long as it held strongly by the argument from design, it kept some touch with concrete realities. Since, however, darwinism has once for all displaced design from the minds of the 'scientific', theism has lost that foothold; and some kind of an immanent or pantheistic deity working *in* things rather than above them is, if any, the kind recommended to our contemporary imagination. Aspirants to a philosophic religion turn, as a rule, more hopefully nowadays towards idealistic pantheism than towards the older dualistic theism, in spite of the fact that the latter still counts able defenders.

But, as I said in my first lecture, the brand of pantheism offered is hard for them to assimilate if they are lovers of facts, or empirically minded. It is the absolutistic brand, spurning the dust and reared upon pure logic. It keeps no connexion whatever with concreteness. Affirming the Absolute Mind, which is its substitute for God, to be the rational presupposition of all particulars of fact, whatever they may be, it remains supremely indifferent to what the particular facts in our world actually are. Be they what they may, the Absolute will father them. Like the sick lion in Esop's fable, all footprints lead into his den, but *nulla vestigia retrorsum.* You cannot redescend into the world of particulars by the Absolute's aid, or deduce any necessary consequences of detail important for your life from your idea of his nature. He gives you indeed the assurance that all is well with *Him,* and for his eternal way of thinking;

but thereupon he leaves you to be finitely saved by your own temporal devices.

Far be it from me to deny the majesty of this conception, or its capacity to yield religious comfort to a most respectable class of minds. But from the human point of view, no one can pretend that it doesn't suffer from the faults of remoteness and abstractness. It is eminently a product of what I have ventured to call the rationalistic temper. It disdains empiricism's needs. It substitutes a pallid outline for the real world's richness. It is dapper; it is noble in the bad sense, in the sense in which to be noble is to be inapt for humble service. In this real world of sweat and dirt, it seems to me that when a view of things is 'noble', that ought to count as a presumption against its truth, and as a philosophic disqualification. The prince of darkness may be a gentleman, as we are told he is, but whatever the God of earth and heaven is, he can surely be no gentleman. His menial services are needed in the dust of our human trials, even more than his dignity is needed in the empyrean.

Now pragmatism, devoted tho she be to facts, has no such materialistic bias as ordinary empiricism labors under. Moreover, she has no objection whatever to the realizing of abstractions, so long as you get about among particulars with their aid and they actually carry you somewhere. Interested in no conclusions but those which our minds and our experiences work out together, she has no *a priori* prejudices against theology. *If theological ideas prove to have a value for concrete life, they will be true, for pragmatism, in the sense of being good for so much. For how much more they are true, will depend entirely on their relations to the other truths that also have to be acknowledged.*

What I said just now about the Absolute of transcendental idealism is a case in point. First, I called it majestic and said it yielded religious comfort to a class of minds, and then I accused it of remoteness and sterility. But so far as it affords such comfort, it surely is not sterile; it has that amount of value; it performs a concrete function. As a good pragmatist, I myself ought to call the Absolute true 'in so far forth', then; and I unhesitatingly now do so.

But what does true *in so far forth* mean in this case? To answer, we need only apply the pragmatic method. What do believers in the Absolute mean by saying that their belief affords them comfort? They mean that since in the Absolute finite evil is 'overruled' already, we may, therefore, whenever we wish, treat the temporal as if it were potentially the eternal, be sure that we can trust its outcome, and, without sin, dismiss our fear and drop the worry of our finite responsibility. In short, they mean that we have a right ever and anon to take a moral holiday, to let the world wag in its own way, feeling that its issues are in better hands than ours and are none of our business.

The universe is a system of which the individual members may relax their anxieties occasionally, in which the don't-care mood is also right for men, and moral holidays in order – that, if I mistake not, is part, at least, of what the

Absolute is 'known-as', that is the great difference in our particular experiences which his being true makes for us, that is part of his cash-value when he is pragmatically interpreted. Farther than that the ordinary lay-reader in philosophy who thinks favorably of absolute idealism does not venture to sharpen his conceptions. He can use the Absolute for so much, and so much is very precious. He is pained at hearing you speak incredulously of the Absolute, therefore, and disregards your criticisms because they deal with aspects of the conception that he fails to follow.

If the Absolute means this, and means no more than this, who can possibly deny the truth of it? To deny it would be to insist that men should never relax, and that holidays are never in order.

I am well aware how odd it must seem to some of you to hear me say that an idea is 'true' so long as to believe it is profitable to our lives. That it is *good*, for as much as it profits, you will gladly admit. If what we do by its aid is good, you will allow the idea itself to be good in so far forth, for we are the better for possessing it. But is it not a strange misuse of the word 'truth', you will say, to call ideas also 'true' for this reason?

To answer this difficulty fully is impossible at this stage of my account. You touch here upon the very central point of Messrs. Schiller's, Dewey's and my own doctrine of truth, which I cannot discuss with detail until my sixth lecture. Let me now say only this, that truth is *one species of good*, and not, as is usually supposed, a category distinct from good, and co-ordinate with it. *The true is the name of whatever proves itself to be good in the way of belief and good, too, for definite, assignable reasons.* Surely you must admit this, that if there were *no* good for life in true ideas, or if the knowledge of them were positively disadvantageous and false ideas the only useful ones, then the current notion that truth is divine and precious, and its pursuit a duty, could never have grown up or become a dogma. In a world like that, our duty would be to *shun* truth, rather. But in this world, just as certain foods are not only agreeable to our taste, but good for our teeth, our stomach and our tissues; so certain ideas are not only agreeable to think about, or agreeable as supporting other ideas that we are fond of, but they are also helpful in life's practical struggles. If there be any life that it is really better we should lead, and if there be any idea which, if believed in, would help us to lead that life, then it would be really *better for us* to believe in that idea, *unless, indeed, belief in it incidentally clashed with other greater vital benefits.*

'What would be better for us to believe'! This sounds very like a definition of truth. It comes very near to saying 'what we *ought* to believe'; and in *that* definition none of you would find any oddity. Ought we ever not to believe what it is *better for us* to believe? And can we then keep the notion of what is better for us, and what is true for us, permanently apart?

Pragmatism says no, and I fully agree with her. Probably you also agree, so far as the abstract statement goes, but with a suspicion that if we practi-

cally did believe everything that made for good in our own personal lives, we should be found indulging all kinds of fancies about this world's affairs, and all kinds of sentimental superstitions about a world hereafter. Your suspicion here is undoubtedly well founded, and it is evident that something happens when you pass from the abstract to the concrete, that complicates the situation.

I said just now that what is better for us to believe is true *unless the belief incidentally clashes with some other vital benefit.* Now in real life what vital benefits is any particular belief of ours most liable to clash with? What indeed except the vital benefits yielded by *other beliefs* when these prove incompatible with the first ones? In other words, the greatest enemy of any one of our truths may be the rest of our truths. Truths have once for all this desperate instinct of self-preservation and of desire to extinguish whatever contradicts them. My belief in the Absolute, based on the good it does me, must run the gauntlet of all my other beliefs. Grant that it may be true in giving me a moral holiday. Nevertheless, as I conceive it – and let me speak now confidentially, as it were, and merely in my own private person – it clashes with other truths of mine whose benefits I hate to give up on its account. It happens to be associated with a kind of logic of which I am the enemy, I find that it entangles me in metaphysical paradoxes that are inacceptable, etc., etc. But as I have enough trouble in life already without adding the trouble of carrying these intellectual inconsistencies, I personally just give up the Absolute. I just *take* my moral holidays; or else as a professional philosopher, I try to justify them by some other principle.

If I could restrict my notion of the Absolute to its bare holiday-giving value, it wouldn't clash with my other truths. But we can not easily thus restrict our hypotheses. They carry supernumerary features, and these it is that clash so. My disbelief in the Absolute means then disbelief in those other supernumerary features, for I fully believe in the legitimacy of taking moral holidays.

You see by this what I meant when I called pragmatism a mediator and reconciler and said, borrowing the word from Papini, that she 'unstiffens' our theories. She has in fact no prejudices whatever, no obstructive dogmas, no rigid canons of what shall count as proof. She is completely genial. She will entertain any hypothesis, she will consider any evidence. It follows that in the religious field she is at a great advantage both over positivistic empiricism, with its anti-theological bias, and over religious rationalism, with its exclusive interest in the remote, the noble, the simple, and the abstract in the way of conception.

In short, she widens the field of search for God. Rationalism sticks to logic and the empyrean. Empiricism sticks to the external senses. Pragmatism is willing to take anything, to follow either logic or the senses, and to count the humblest and most personal experiences. She will count mystical experi-

ences if they have practical consequences. She will take a God who lives in the very dirt of private fact – if that should seem a likely place to find him.

Her only test of probable truth is what works best in the way of leading us, what fits every part of life best and combines with the collectivity of experience's demands, nothing being omitted. If theological ideas should do this, if the notion of God, in particular, should prove to do it, how could pragmatism possibly deny God's existence? She could see no meaning in treating as 'not true' a notion that was pragmatically so successful. What other kind of truth could there be, for her, than all this agreement with concrete reality?

In my last lecture I shall return again to the relations of pragmatism with religion. But you see already how democratic she is. Her manners are as various and flexible, her resources as rich and endless, and her conclusions as friendly as those of mother nature.

PRAGMATISM'S CONCEPTION OF TRUTH

William James, "Pragmatism's Conception of Truth." *Pragmatism: A New Name for Some Old Ways of Thinking* (New York: Longmans, Green and Co., 1907), chap. 6, pp. 197–236.

When Clerk Maxwell was a child it is written that he had a mania for having everything explained to him, and that when people put him off with vague verbal accounts of any phenomenon he would interrupt them impatiently by saying, "Yes; but I want you to tell me the *particular go* of it!" Had his question been about truth, only a pragmatist could have told him the particular go of it. I believe that our contemporary pragmatists, especially Messrs. Schiller and Dewey, have given the only tenable account of this subject. It is a very ticklish subject, sending subtle rootlets into all kinds of crannies, and hard to treat in the sketchy way that alone befits a public lecture. But the Schiller-Dewey view of truth has been so ferociously attacked by rationalistic philosophers, and so abominably misunderstood, that here, if anywhere, is the point where a clear and simple statement should be made.

I fully expect to see the pragmatist view of truth run through the classic stages of a theory's career. First, you know, a new theory is attacked as absurd; then it is admitted to be true, but obvious and insignificant; finally it is seen to be so important that its adversaries claim that they themselves discovered it. Our doctrine of truth is at present in the first of these three stages, with symptoms of the second stage having begun in certain quarters. I wish that this lecture might help it beyond the first stage in the eyes of many of you.

Truth, as any dictionary will tell you, is a property of certain of our ideas. It means their 'agreement', as falsity means their disagreement, with 'reality'. Pragmatists and intellectualists both accept this definition as a matter of course. They begin to quarrel only after the question is raised as to what may precisely be meant by the term 'agreement', and what by the term 'reality', when reality is taken as something for our ideas to agree with.

In answering these questions the pragmatists are more analytic and painstaking, the intellectualists more offhand and irreflective. The popular notion is that a true idea must copy its reality. Like other popular views, this one follows the analogy of the most usual experience. Our true ideas of sensible things do indeed copy them. Shut your eyes and think of yonder clock on the wall, and you get just such a true picture or copy of its dial. But your

idea of its 'works' (unless you are a clock-maker) is much less of a copy, yet it passes muster, for it in no way clashes with the reality. Even tho it should shrink to the mere word 'works', that word still serves you truly; and when you speak of the 'time-keeping function' of the clock, or of its spring's 'elasticity', it is hard to see exactly what your ideas can copy.

You perceive that there is a problem here. Where our ideas cannot copy definitely their object, what does agreement with that object mean? Some idealists seem to say that they are true whenever they are what God means that we ought to think about that object. Others hold the copy-view all through, and speak as if our ideas possessed truth just in proportion as they approach to being copies of the Absolute's eternal way of thinking.

These views, you see, invite pragmatistic discussion. But the great assumption of the intellectualists is that truth means essentially an inert static relation. When you've got your true idea of anything, there's an end of the matter. You're in possession; you *know*; you have fulfilled your thinking destiny. You are where you ought to be mentally; you have obeyed your categorical imperative; and nothing more need follow on that climax of your rational destiny. Epistemologically you are in stable equilibrium.

Pragmatism, on the other hand, asks its usual question. "Grant an idea or belief to be true," it says, "what concrete difference will its being true make in anyone's actual life? How will the truth be realized? What experiences will be different from those which would obtain if the belief were false? What, in short, is the truth's cash-value in experiential terms?"

The moment pragmatism asks this question, it sees the answer: *True ideas are those that we can assimilate, validate, corroborate and verify. False ideas are those that we cannot*. That is the practical difference it makes to us to have true ideas; that, therefore, is the meaning of truth, for it is all that truth is known-as.

This thesis is what I have to defend. The truth of an idea is not a stagnant property inherent in it. Truth *happens* to an idea. It *becomes* true, is *made* true by events. Its verity *is* in fact an event, a process: the process namely of its verifying itself, its veri-*fication*. Its validity is the process of its valid-*ation*.

But what do the words verification and validation themselves pragmatically mean? They again signify certain practical consequences of the verified and validated idea. It is hard to find any one phrase that characterizes these consequences better than the ordinary agreement formula – just such consequences being what we have in mind whenever we say that our ideas 'agree' with reality. They lead us, namely, through the acts and other ideas which they instigate, into or up to, or towards, other parts of experience with which we feel all the while such feeling being among our potentialities – that the original ideas remain in agreement. The connexions and transitions come to us from point to point as being progressive, harmonious, satisfactory. This function of agreeable leading is what we mean by an idea's verification. Such an

account is vague and it sounds at first quite trivial, but it has results which it will take the rest of my hour to explain.

Let me begin by reminding you of the fact that the possession of true thoughts means everywhere the possession of invaluable instruments of action; and that our duty to gain truth, so far from being a blank command from out of the blue, or a 'stunt' self-imposed by our intellect, can account for itself by excellent practical reasons.

The importance to human life of having true beliefs about matters of fact is a thing too notorious. We live in a world of realities that can be infinitely useful or infinitely harmful. Ideas that tell us which of them to expect count as the true ideas in all this primary sphere of verification, and the pursuit of such ideas is a primary human duty. The possession of truth, so far from being here an end in itself, is only a preliminary means towards other vital satisfactions. If I am lost in the woods and starved, and find what looks like a cow-path, it is of the utmost importance that I should think of a human habitation at the end of it, for if I do so and follow it, I save myself. The true thought is useful here because the house which is its object is useful. The practical value of true ideas is thus primarily derived from the practical importance of their objects to us. Their objects are, indeed, not important at all times. I may on another occasion have no use for the house; and then my idea of it, however verifiable, will be practically irrelevant, and had better remain latent. Yet since almost any object may some day become temporarily important, the advantage of having a general stock of *extra* truths, of ideas that shall be true of merely possible situations, is obvious. We store such extra truths away in our memories, and with the overflow we fill our books of reference. Whenever such an extra truth becomes practically relevant to one of our emergencies, it passes from cold-storage to do work in the world, and our belief in it grows active. You can say of it then either that 'it is useful because it is true' or that 'it is true because it is useful'. Both these phrases mean exactly the same thing, namely that here is an idea that gets fulfilled and can be verified. True is the name for whatever idea starts the verification-process, useful is the name for its completed function in experience. True ideas would never have been singled out as such, would never have acquired a class-name, least of all a name suggesting value, unless they had been useful from the outset in this way.

From this simple cue pragmatism gets her general notion of truth as something essentially bound up with the way in which one moment in our experience may lead us towards other moments which it will be worth while to have been led to. Primarily, and on the common-sense level, the truth of a state of mind means this function of *a leading that is worth while*. When a moment in our experience, of any kind whatever, inspires us with a thought that is true, that means that sooner or later we dip by that thought's guidance into the particulars of experience again and make advantageous connexion

with them. This is a vague enough statement, but I beg you to retain it, for it is essential.

Our experience meanwhile is all shot through with regularities. One bit of it can warn us to get ready for another bit, can 'intend' or 'be significant of' that remoter object. The object's advent is the significance's verification. Truth, in these cases, meaning nothing but eventual verification, is manifestly incompatible with waywardness on our part. Woe to him whose beliefs play fast and loose with the order which realities follow in his experience: they will lead him nowhere or else make false connexions.

By 'realities' or 'objects' here, we mean either things of common sense, sensibly present, or else common-sense relations, such as dates, places, distances, kinds, activities. Following our mental image of a house along the cow-path, we actually come to see the house; we get the image's full verification. *Such simply and fully verified leadings are certainly the originals and prototypes of the truth-process.* Experience offers indeed other forms of truth-process, but they are all conceivable as being primary verifications arrested, multiplied or substituted one for another.

Take, for instance, yonder object on the wall. You and I consider it to be a 'clock', altho no one of us has seen the hidden works that make it one. We let our notion pass for true without attempting to verify. If truths mean verification-process essentially, ought we then to call such unverified truths as this abortive? No, for they form the overwhelmingly large number of the truths we live by. Indirect as well as direct verifications pass muster. Where circumstantial evidence is sufficient, we can go without eye-witnessing. Just as we here assume Japan to exist without ever having been there, because it *works* to do so, everything we know conspiring with the belief, and nothing interfering, so we assume that thing to be a clock. We *use* it as a clock, regulating the length of our lecture by it. The verification of the assumption here means its leading to no frustration or contradiction. Verifi*ability* of wheels and weights and pendulum is as good as verification. For one truth-process completed there are a million in our lives that function in this state of nascency. They turn us *towards* direct verification; lead us into the *surroundings* of the objects they envisage; and then, if everything runs on harmoniously, we are so sure that verification is possible that we omit it, and are usually justified by all that happens.

Truth lives, in fact, for the most part on a credit system. Our thoughts and beliefs 'pass', so long as nothing challenges them, just as bank-notes pass so long as nobody refuses them. But this all points to direct face-to-face verifications somewhere, without which the fabric of truth collapses like a financial system with no cash-basis whatever. You accept my verification of one thing, I yours of another. We trade on each other's truth. But beliefs verified concretely by *somebody* are the posts of the whole superstructure.

Another great reason – beside economy of time – for waiving complete

verification in the usual business of life is that all things exist in kinds and not singly. Our world is found once for all to have that peculiarity. So that when we have once directly verified our ideas about one specimen of a kind, we consider ourselves free to apply them to other specimens without verification. A mind that habitually discerns the kind of thing before it, and acts by the law of the kind immediately, without pausing to verify, will be a 'true' mind in ninety-nine out of a hundred emergencies, proved so by its conduct fitting everything it meets, and getting no refutation.

Indirectly or only potentially verifying processes may thus be true as well as full verification-processes. They work as true processes would work, give us the same advantages, and claim our recognition for the same reasons. All this on the common-sense level of matters of fact, which we are alone considering.

But matters of fact are not our only stock in trade. *Relations among purely mental ideas* form another sphere where true and false beliefs obtain, and here the beliefs are absolute, or unconditional. When they are true they bear the name either of definitions or of principles. It is either a principle or a definition that 1 and 1 make 2, that 2 and 1 make 3, and so on; that white differs less from gray than it does from black; that when the cause begins to act the effect also commences. Such propositions hold of all possible 'ones', of all conceivable 'whites' and 'grays' and 'causes'. The objects here are mental objects. Their relations are perceptually obvious at a glance, and no sense-verification is necessary. Moreover, once true, always true, of those same mental objects. Truth here has an 'eternal' character. If you can find a concrete thing anywhere that is 'one' or 'white' or 'gray', or an 'effect', then your principles will everlastingly apply to it. It is but a case of ascertaining the kind, and then applying the law of its kind to the particular object. You are sure to get truth if you can but name the kind rightly, for your mental relations hold good of everything of that kind without exception. If you then, nevertheless, failed to get truth concretely, you would say that you had classed your real objects wrongly.

In this realm of mental relations, truth again is an affair of leading. We relate one abstract idea with another, framing in the end great systems of logical and mathematical truth, under the respective terms of which the sensible facts of experience eventually arrange themselves, so that our eternal truths hold good of realities also. This marriage of fact and theory is endlessly fertile. What we say is here already true in advance of special verification, *if we have subsumed our objects rightly*. Our ready-made ideal framework for all sorts of possible objects follows from the very structure of our thinking. We can no more play fast and loose with these abstract relations than we can do so with our sense-experiences. They coerce us; we must treat them consistently, whether or not we like the results. The rules of addition apply to our debts as rigorously as to our assets. The hundredth decimal of π, the ratio of the

circumference to its diameter, is predetermined ideally now, tho no one may have computed it. If we should ever need the figure in our dealings with an actual circle we should need to have it given rightly, calculated by the usual rules; for it is the same kind of truth that those rules elsewhere calculate.

Between the coercions of the sensible order and those of the ideal order, our mind is thus wedged tightly. Our ideas must agree with realities, be such realities concrete or abstract, be they facts or be they principles, under penalty of endless inconsistency and frustration.

So far, intellectualists can raise no protest. They can only say that we have barely touched the skin of the matter.

Realities mean, then, either concrete facts, or abstract kinds of things and relations perceived intuitively between them. They furthermore and thirdly mean, as things that new ideas of ours must no less take account of, the whole body of other truths already in our possession. But what now does 'agreement' with such threefold realities mean? – to use again the definition that is current.

Here it is that pragmatism and intellectualism begin to part company. Primarily, no doubt, to agree means to copy, but we saw that the mere word 'clock' would do instead of a mental picture of its works, and that of many realities our ideas can only be symbols and not copies. 'Past time', 'power', 'spontaneity'– how can our mind copy such realities?

To 'agree' in the widest sense with a reality, *can only mean to be guided either straight up to it or into its surroundings, or to be put into such working touch with it as to handle either it or something connected with it better than if we disagreed*. Better either intellectually or practically! And often agreement will only mean the negative fact that nothing contradictory from the quarter of that reality comes to interfere with the way in which our ideas guide us elsewhere. To copy a reality is, indeed, one very important way of agreeing with it, but it is far from being essential. The essential thing is the process of being guided. Any idea that helps us to *deal*, whether practically or intellectually, with either the reality or its belongings, that doesn't entangle our progress in frustrations, that *fits*, in fact, and adapts our life to the reality's whole setting, will agree sufficiently to meet the requirement. It will hold true of that reality.

Thus, *names* are just as 'true' or 'false' as definite mental pictures are. They set up similar verification-processes, and lead to fully equivalent practical results.

All human thinking gets discursified; we exchange ideas; we lend and borrow verifications, get them from one another by means of social intercourse. All truth thus gets verbally built out, stored up, and made available for everyone. Hence, we must *talk* consistently just as we must *think* consistently: for both in talk and thought we deal with kinds. Names are arbitrary, but once understood they must be kept to. We mustn't now call Abel 'Cain'

or Cain 'Abel'. If we do, we ungear ourselves from the whole book of Genesis, and from all its connexions with the universe of speech and fact down to the present time. We throw ourselves out of whatever truth that entire system of speech and fact may embody.

The overwhelming majority of our true ideas admit of no direct or face-to-face verification – those of past history, for example, as of Cain and Abel. The stream of time can be remounted only verbally, or verified indirectly by the present prolongations or effects of what the past harbored. Yet if they agree with these verbalities and effects, we can know that our ideas of the past are true. *As true as past time itself was*, so true was Julius Caesar, so true were antediluvian monsters, all in their proper dates and settings. That past time itself was, is guaranteed by its coherence with everything that's present. True as the present *is*, the past *was* also.

Agreement thus turns out to be essentially an affair of leading – leading that is useful because it is into quarters that contain objects that are important. True ideas lead us into useful verbal and conceptual quarters as well as directly up to useful sensible termini. They lead to consistency, stability and flowing human intercourse. They lead away from excentricity and isolation, from foiled and barren thinking. The untrammeled flowing of the leading-process, its general freedom from clash and contradiction, passes for its indirect verification; but all roads lead to Rome, and in the end and eventually, all true processes must lead to the face of directly verifying sensible experiences *somewhere*, which somebody's ideas have copied.

Such is the large loose way in which the pragmatist interprets the word agreement. He treats it altogether practically. He lets it cover any process of conduction from a present idea to a future terminus, provided only it run prosperously. It is only thus that 'scientific' ideas, flying as they do beyond common sense, can be said to agree with their realities. It is, as I have already said, *as if* reality were made of ether, atoms or electrons, but we mustn't think so literally. The term 'energy' doesn't even pretend to stand for anything 'objective'. It is only a way of measuring the surface of phenomena so as to string their changes on a simple formula.

Yet in the choice of these man-made formulas we cannot be capricious with impunity any more than we can be capricious on the common-sense practical level. We must find a theory that will *work*; and that means something extremely difficult; for our theory must mediate between all previous truths and certain new experiences. It must derange common sense and previous belief as little as possible, and it must lead to some sensible terminus or other that can be verified exactly. To 'work' means both these things; and the squeeze is so tight that there is little loose play for any hypothesis. Our theories are wedged and controlled as nothing else is. Yet sometimes alternative theoretic formulas are equally compatible with all the truths we know, and then we choose between them for subjective reasons. We choose the kind

of theory to which we are already partial; we follow 'elegance' or 'economy'. Clerk Maxwell somewhere says it would be "poor scientific taste" to choose the more complicated of two equally well-evidenced conceptions; and you will all agree with him. Truth in science is what gives us the maximum possible sum of satisfactions, taste included, but consistency both with previous truth and with novel fact is always the most imperious claimant.

I have led you through a very sandy desert. But now, if I may be allowed so vulgar an expression, we begin to taste the milk in the cocoanut. Our rationalist critics here discharge their batteries upon us, and to reply to them will take us out from all this dryness into full sight of a momentous philosophical alternative.

Our account of truth is an account of truths in the plural, of processes of leading, realized in *rebus*, and having only this quality in common, that they *pay*. They pay by guiding us into or towards some part of a system that dips at numerous points into sense-percepts, which we may copy mentally or not, but with which at any rate we are now in the kind of commerce vaguely designated as verification. Truth for us is simply a collective name for verification-processes, just as health, wealth, strength, etc., are names for other processes connected with life, and also pursued because it pays to pursue them. Truth is *made*, just as health, wealth and strength are made, in the course of experience.

Here rationalism is instantaneously up in arms against us. I can imagine a rationalist to talk as follows:

"Truth is not made," he will say; "it absolutely obtains, being a unique relation that does not wait upon any process, but shoots straight over the head of experience, and hits its reality every time. Our belief that yon thing on the wall is a clock is true already, altho no one in the whole history of the world should verify it. The bare quality of standing in that transcendent relation is what makes any thought true that possesses it, whether or not there be verification. You pragmatists put the cart before the horse in making truth's being reside in verification-processes. These are merely signs of its being, merely our lame ways of ascertaining after the fact, which of our ideas already has possessed the wondrous quality. The quality itself is timeless, like all essences and natures. Thoughts partake of it directly, as they partake of falsity or of irrelevancy. It can't be analyzed away into pragmatic consequences."

The whole plausibility of this rationalist tirade is due to the fact to which we have already paid so much attention. In our world, namely abounding as it does in things of similar kinds and similarly associated, one verification serves for others of its kind, and one great use of knowing things is to be led not so much to them as to their associates, especially to human talk about them. The quality of truth, obtaining *ante rem*, pragmatically means, then, the fact that in such a world innumerable ideas work better by their indirect or possible than by their direct and actual verification. Truth *ante rem* means

only verifiability, then; or else it is a case of the stock rationalist trick of treating the *name* of a concrete phenomenal reality as an independent prior entity, and placing it behind the reality as its explanation. Professor Mach quotes somewhere an epigram of Lessing's:

> Sagt Hänschen Schlau zu Vetter Fritz,
> "Wie kommt es, Vetter Fritzen,
> Dass grad' die Reichsten in der Welt,
> Das meiste Geld besitzen?"

Hänschen Schlau here treats the principle 'wealth' as something distinct from the facts denoted by the man's being rich. It antedates them; the facts become only a sort of secondary coincidence with the rich man's essential nature.

In the case of 'wealth' we all see the fallacy. We know that wealth is but a name for concrete processes that certain men's lives play a part in, and not a natural excellence found in Messrs. Rockefeller and Carnegie, but not in the rest of us.

Like wealth, health also lives *in rebus*. It is a name for processes, as digestion, circulation, sleep, etc., that go on happily, tho in this instance we are more inclined to think of it as a principle and to say the man digests and sleeps so well *because* he is so healthy.

With 'strength' we are, I think, more rationalistic still, and decidedly inclined to treat it as an excellence pre-existing in the man and explanatory of the herculean performances of his muscles.

With 'truth' most people go over the border entirely, and treat the rationalistic account as self-evident. But really all these words in *th* are exactly similar. Truth exists *ante rem* just as much and as little as the other things do.

The scholastics, following Aristotle, made much of the distinction between habit and act. Health *in actu* means, among other things, good sleeping and digesting. But a healthy man need not always be sleeping, or always digesting, any more than a wealthy man need be always handling money or a strong man always lifting weights. All such qualities sink to the status of 'habits' between their times of exercise; and similarly truth becomes a habit of certain of our ideas and beliefs in their intervals of rest from their verifying activities. But those activities are the root of the whole matter, and the condition of there being any habit to exist in the intervals.

'The true', to put it very briefly, is only the expedient in the way of our thinking, just as 'the right' is only the expedient in the way of our behaving. Expedient in almost any fashion; and expedient in the long run and on the whole of course; for what meets expediently all the experience in sight won't necessarily meet all farther experiences equally satisfactorily. Experience, as we know, has ways of *boiling over*, and making us correct our present formulas.

The 'absolutely' true, meaning what no farther experience will ever alter, is that ideal vanishing-point towards which we imagine that all our temporary truths will some day converge. It runs on all fours with the perfectly wise man, and with the absolutely complete experience; and, if these ideals are ever realized, they will all be realized together. Meanwhile we have to live to-day by what truth we can get to-day, and be ready to-morrow to call it falsehood. Ptolemaic astronomy, euclidean space, aristotelian logic, scholastic metaphysics, were expedient for centuries, but human experience has boiled over those limits, and we now call these things only relatively true, or true within those borders of experience. 'Absolutely' they are false; for we know that those limits were casual, and might have been transcended by past theorists just as they are by present thinkers.

When new experiences lead to retrospective judgments, using the past tense, what these judgments utter *was* true, even tho no past thinker had been led there. We live forwards, a Danish thinker has said, but we understand backwards. The present sheds a backward light on the world's previous processes. They may have been truth-processes for the actors in them. They are not so for one who knows the later revelations of the story.

This regulative notion of a potential better truth to be established later, possibly to be established some day absolutely, and having powers of retroactive legislation, turns its face, like all pragmatist notions, towards concreteness of fact, and towards the future. Like the half-truths, the absolute truth will have to be *made*, made is a relation incidental to the growth of a mass of verification-experience, to which the half-true ideas are all along contributing their quota.

I have already insisted on the fact that truth is made largely out of previous truths. Men's beliefs at any time are so much experience *funded*. But the beliefs are themselves parts of the sum total of the world's experience, and become matter, therefore, for the next day's funding operations. So far as reality means experienceable reality, both it and the truths men gain about it are everlastingly in process of mutation – mutation towards a definite goal, it may be – but still mutation.

Mathematicians can solve problems with two variables. On the Newtonian theory, for instance, acceleration varies with distance, but distance also varies with acceleration. In the realm of truth-processes facts come independently and determine our beliefs provisionally. But these beliefs make us act, and as fast as they do so, they bring into sight or into existence new facts which re-determine the beliefs accordingly. So the whole coil and ball of truth, as it rolls up, is the product of a double influence. Truths emerge from facts; but they dip forward into facts again and add to them; which facts again create or reveal new truth (the word is indifferent) and so on indefinitely. The 'facts' themselves meanwhile are not *true*. They simply *are*. Truth is the function of the beliefs that start and terminate among them.

The case is like a snowball's growth, due as it is to the distribution of the snow on the one hand, and to the successive pushes of the boys on the other, with these factors co-determining each other incessantly.

The most fateful point of difference between being a rationalist and being a pragmatist is now fully in sight. Experience is in mutation, and our psychological ascertainments of truth are in mutation – so much rationalism will allow; but never that either reality itself or truth itself is mutable. Reality stands complete and ready-made from all eternity, rationalism insists, and the agreement of our ideas with it is that unique unanalyzable virtue in them of which she has already told us. As that intrinsic excellence, their truth has nothing to do with our experiences. It adds nothing to the content of experience. It makes no difference to reality itself; it is supervenient, inert, static, a reflexion merely. It doesn't *exist*, it *holds* or *obtains*, it belongs to another dimension from that of either facts or fact-relations, belongs, in short, to the epistemological dimension – and with that big word rationalism closes the discussion.

Thus, just as pragmatism faces forward to the future, so does rationalism here again face backward to a past eternity. True to her inveterate habit, rationalism reverts to 'principles', and thinks that when an abstraction once is named, we own an oracular solution.

The tremendous pregnancy in the way of consequences for life of this radical difference of outlook will only become apparent in my later lectures. I wish meanwhile to close this lecture by showing that rationalism's sublimity does not save it from inanity.

When, namely, you ask rationalists, instead of accusing pragmatism of desecrating the notion of truth, to define it themselves by saying exactly what *they* understand by it, the only positive attempts I can think of are these two:

1. "Truth is just the system of propositions which have an unconditional claim to be recognized as valid.[1]

2. Truth is a name for all those judgments which we find ourselves under obligation to make by a kind of imperative duty.[2]

The first thing that strikes one in such definitions is their unutterable triviality. They are absolutely true, of course, but absolutely insignificant until you handle them pragmatically. What do you mean by 'claim' here, and what do you mean by 'duty'? As summary names for the concrete reasons why thinking in true ways is overwhelmingly expedient and good for mortal men, it is all right to talk of claims on reality's part to be agreed with, and of obligations on our part to agree. We feel both the claims and the obligations, and we feel them for just those reasons.

[1] A. E. Taylor, *Philosophical Review*, vol. xiv, p. 288.

[2] H. Rickert, *Der Gegenstand der Erkenntniss*, chapter on 'Die Urtheilsnothwendigkeit'.

But the rationalists who talk of claim and obligation *expressly say that they have nothing to do with our practical interests or personal reasons*. Our reasons for agreeing are psychological facts, they say, relative to each thinker, and to the accidents of his life. They are his evidence merely, they are no part of the life of truth itself. That life transacts itself in a purely logical or epistemological, as distinguished from a psychological, dimension, and its claims antedate and exceed all personal motivations whatsoever. Tho neither man nor God should ever ascertain truth, the word would still have to be defined as that which *ought* to be ascertained and recognized.

There never was a more exquisite example of an idea abstracted from the concretes of experience and then used to oppose and negate what it was abstracted from.

Philosophy and common life abound in similar instances. The 'sentimentalist fallacy' is to shed tears over abstract justice and generosity, beauty, etc., and never to know these qualities when you meet them in the street, because there the circumstances make them vulgar. Thus I read in the privately printed biography of an eminently rationalistic mind: "It was strange that with such admiration for beauty in the abstract, my brother had no enthusiasm for fine architecture, for beautiful painting, or for flowers." And in almost the last philosophic work I have read, I find such passages as the following: "Justice is ideal, solely ideal. Reason conceives that it ought to exist, but experience shows that it cannot.... Truth, which ought to be, cannot be.... Reason is deformed by experience. As soon as reason enters experience, it becomes contrary to reason."

The rationalist's fallacy here is exactly like the sentimentalist's. Both extract a quality from the muddy particulars of experience, and find it so pure when extracted that they contrast it with each and all its muddy instances as an opposite and higher nature. All the while it is *their* nature. It is the nature of truths to be validated, verified. It pays for our ideas to be validated. Our obligation to seek truth is part of our general obligation to do what pays. The payments true ideas bring are the sole why of our duty to follow them.

Identical whys exist in the case of wealth and health. Truth makes no other kind of claim and imposes no other kind of ought than health and wealth do. All these claims are conditional; the concrete benefits we gain are what we mean by calling the pursuit a duty. In the case of truth, untrue beliefs work as perniciously in the long run as true beliefs work beneficially. Talking abstractly, the quality 'true' may thus be said to grow absolutely precious, and the quality 'untrue' absolutely damnable: the one may be called good, the other bad, unconditionally. We ought to think the true, we ought to shun the false, imperatively.

But if we treat all this abstraction literally and oppose it to its mother soil in experience, see what a preposterous position we work ourselves into.

We cannot then take a step forward in our actual thinking. When shall I acknowledge this truth and when that? Shall the acknowledgment be loud? – or silent? If sometimes loud, sometimes silent, which *now*? When may a truth go into cold-storage in the encyclopedia? and when shall it come out for battle? Must I constantly be repeating the truth 'twice two are four' because of its eternal claim on recognition? or is it sometimes irrelevant? Must my thoughts dwell night and day on my personal sins and blemishes, because I truly have them? – or may I sink and ignore them in order to be a decent social unit, and not a mass of morbid melancholy and apology?

It is quite evident that our obligation to acknowledge truth, so far from being unconditional, is tremendously conditioned. Truth with a big T, and in the singular, claims abstractly to be recognized, of course; but concrete truths in the plural need be recognized only when their recognition is expedient. A truth must always be preferred to a falsehood when both relate to the situation; but when neither does, truth is as little of a duty as falsehood. If you ask me what o'clock it is and I tell you that I live at 95 Irving Street, my answer may indeed be true, but you don't see why it is my duty to give it. A false address would be as much to the purpose.

With this admission that there are conditions that limit the application of the abstract imperative, *the pragmatistic treatment of truth sweeps back upon us in its fulness*. Our duty to agree with reality is seen to be grounded in a perfect jungle of concrete expediencies.

When Berkeley had explained what people meant by matter, people thought that he denied matter's existence. When Messrs. Schiller and Dewey now explain what people mean by truth, they are accused of denying *its* existence. These pragmatists destroy all objective standards, critics say, and put foolishness and wisdom on one level. A favorite formula for describing Mr. Schiller's doctrines and mine is that we are persons who think that by saying whatever you find it pleasant to say and calling it truth you fulfil every pragmatistic requirement.

I leave it to you to judge whether this be not an impudent slander. Pent in, as the pragmatist more than anyone else sees himself to be, between the whole body of funded truths squeezed from the past and the coercions of the world of sense about him, who so well as he feels the immense pressure of objective control under which our minds perform their operations? If anyone imagines that this law is lax, let him keep its commandment one day, says Emerson. We have heard much of late of the uses of the imagination in science. It is high time to urge the use of a little imagination in philosophy. The unwillingness of some of our critics to read any but the silliest of possible meanings into our statements is as discreditable to their imaginations as anything I know in recent philosophic history. Schiller says the true is that which 'works'. Thereupon he is treated as one who limits verification to the lowest material utilities. Dewey says truth is what gives 'satisfaction'.

He is treated as one who believes in calling everything true which, if it were true, would be pleasant.

Our critics certainly need more imagination of realities. I have honestly tried to stretch my own imagination and to read the best possible meaning into the rationalist conception, but I have to confess that it still completely baffles me. The notion of a reality calling on us to 'agree' with it, and that for no reasons, but simply because its claim is 'unconditional' or 'transcendent', is one that I can make neither head nor tail of. I try to imagine myself as the sole reality in the world, and then to imagine what more I would 'claim' if I were allowed to. If you suggest the possibility of my claiming that a mind should come into being from out of the void inane and stand and *copy* me, I can indeed imagine what the copying might mean, but I can conjure up no motive. What good it would do me to be copied, or what good it would do that mind to copy me, if farther consequences are expressly and in principle ruled out as motives for the claim (as they are by our rationalist authorities) I cannot fathom. When the Irishman's admirers ran him along to the place of banquet in a sedan chair with no bottom, he said, "Faith, if it wasn't for the honor of the thing, I might as well have come on foot." So here: but for the honor of the thing, I might as well have remained uncopied. Copying is one genuine mode of knowing (which for some strange reason our contemporary transcendentalists seem to be tumbling over each other to repudiate); but when we get beyond copying, and fall back on unnamed forms of agreeing that are expressly denied to be either copyings or leadings or fittings, or any other processes pragmatically definable, the *what* of the 'agreement' claimed becomes as unintelligible as the why of it. Neither content nor motive can be imagined for it. It is an absolutely meaningless abstraction.[3]

Surely in this field of truth it is the pragmatists and not the rationalists who are the more genuine defenders of the universe's rationality.

[3] I am not forgetting that Professor Rickert long ago gave up the whole notion of truth being founded on agreement with reality. Reality, according to him, is whatever agrees with truth, and truth is founded solely on our primal duty. This fantastic flight, together with Mr. Joachim's candid confession of failure in his book *The Nature of Truth*, seems to me to mark the bankruptcy of rationalism when dealing with this subject. Rickert deals with part of the pragmatistic position under the head of what he calls 'Relativismus'. I cannot discuss his text here. Suffice it to say that his argumentation in that chapter is so feeble as to seem almost incredible in so generally able a writer.

HUMANISM AND TRUTH

William James, "Humanism and Truth." (New York: Longmans, Green and Co., 1909), chap. 3, pp. 51–101.

Receiving from the Editor of an advance proof of Mr. Bradley's article on 'Truth and Practice', I understand this as a hint to me to join in the controversy over 'Pragmatism' which seems to have seriously begun. As my name has been coupled with the movement, I deem it wise to take the hint, the more so as in some quarters greater credit has been given me than I deserve, and probably undeserved discredit in other quarters falls also to my lot.

First, as to the word 'pragmatism'. I myself have only used the term to indicate a method of carrying on abstract discussion. The serious meaning of a concept, says Mr. Peirce, lies in the concrete difference to some one which its being true will make. Strive to bring all debated conceptions to that 'pragmatic' test, and you will escape vain wrangling: if it can make no practical difference which of two statements be true, then they are really one statement in two verbal forms; if it can make no practical difference whether a given statement be true or false, then the statement has no real meaning. In neither case is there anything fit to quarrel about: we may save our breath, and pass to more important things.

All that the pragmatic method implies, then, is that truths should practical[1] consequences. In England the word has been used more broadly still, to cover the notion that the truth of any statement *consists* in the consequences, and particularly in their being good consequences. Here we get beyond affairs of method altogether; and since my pragmatism and this wider pragmatism are so different, and both an important enough to have different names, I think that Mr. Schiller's proposal to call the wider pragmatism by the name of 'humanism' is excellent and ought to be adopted. The narrower pragmatism may still be spoken of as the 'pragmatic method'.

I have read in the past six months many hostile reviews of Schiller's and Dewey's publications; but with the exception of Mr. Bradley's elaborate indictment, they are out of reach where I write, and I have largely forgotten them. I think that a free discussion of the subject on my part would in any case be more useful than a polemic attempt at rebutting these criticisms in

[1] ['Practical' in the sense of, of course, not in the sense that the consequences may not be as well as physical.]

detail. Mr. Bradley in particular can be taken care of by Mr. Schiller. He repeatedly confesses himself unable to comprehend Schiller's views, he evidently has not sought to do so sympathetically, and I deeply regret to say that his laborious article throws, for my mind, absolutely no useful light upon the subject. It seems to me on the whole ar and I feel free to disregard it altogether.

The subject is unquestionably difficult. Messrs. Dewey's and Schiller's thought is eminently an induction, a generalization working itself free from all sorts of entangling particulars. If true, it involves much restatement of traditional notions. This is a kind of intellectual product that never attains a classic form of expression when first promulgated. The critic ought therefore not to be too sharp and logic-chopping in his dealings with it, but should weigh it as a whole, and especially weigh it against its possible alternatives. One should also try to apply it first to one instance, and then to another to see how it will work. It seems to me that it is emphatically not a case for instant execution, by conviction of intrinsic absurdity or of self-contradiction, or by caricature of what it would look like if reduced to skeleton shape. Humanism is in fact much more like one of those secular changes that come upon public opinion overnight, as it were, borne upon tides 'too deep for sound or foam', that survive all the crudities and extravagances of their advocates, that you can pin to no one absolutely essential statement, nor kill by any one decisive stab.

Such have been the changes from aristocracy to democracy, from classic to romantic taste, from theistic to pantheistic feeling, from static to evolutionary ways of understanding life – changes of which we all have been spectators. Scholasticism still opposes to such changes the method of confutation by single decisive reasons, showing that the new view involves self-contradiction, or traverses some fundamental principle. This is like stopping a river by planting a stick in the middle of its bed. Round your obstacle flows the water and 'gets there all the same'. In reading some of our opponents, I am not a little reminded of those catholic writers who refute darwinism by telling us that higher species cannot come from lower because *minus plus*, or that the notion of transformation is absurd, for it implies that species tend to their own destruction, and that would violate the principle that every reality tends to persevere in its own shape. The point of view is too myopic, too tight and close to take in the inductive argument. Wide generalizations in science always meet with these summary refutations in their early days; but they outlive them, and the refutations then sound oddly antiquated and scholastic. I cannot help suspecting that the humanistic theory is going through this kind of would-be refutation at present.

The one condition of understanding humanism is to become inductive-minded oneself, to drop rigorous definitions, and follow lines of least resistance 'on the whole'. "In other words," an opponent might say, "resolve your

intellect into a kind of slush." "Even so," I make reply, – "if you will consent to use no politer word." For humanism, conceiving the more 'true' as the more 'satisfactory' (Dewey's term), has sincerely to renounce rectilinear arguments and ancient ideals of rigor and finality. It is in just this temper of renunciation, so different from that of pyrrhonistic scepticism, that the spirit of humanism essentially consists. Satisfactoriness has to be measured by a multitude of standards, of which some, for aught we know, may fail in any given case; and what is more satisfactory than any alternative in sight, may to the end be a sum of *pluses* and concerning which we can only trust that by ulterior corrections and improvements a maximum of the one and a minimum of the other may some day be approached. It means a real change of heart, a break with absolutistic hopes, when one takes up this inductive view of the conditions of belief.

As I understand the pragmatist way of seeing things, it owes its being to the break-down which the last fifty years have brought about in the older notions of scientific truth. "God geometrizes," it used to be said; and it was believed that Euclid's elements literally reproduced his geometrizing. There is an eternal and unchangeable 'reason'; and its voice was supposed to reverberate in and So also of the 'laws of nature', physical and chemical, so of natural history classifications – all were supposed to be exact and exclusive duplicates of pre-human archetypes buried in the structure of things, to which the spark of divinity hidden in our intellect enables us to penetrate. The anatomy of the world is logical, and its logic is that of a university professor, it was thought. Up to about 1850 almost every one believed that sciences expressed truths that were exact copies of a definite code of non-human realities. But the enormously rapid multiplication of theories in these latter days has well-nigh upset the notion of any one of them being a more literally objective kind of thing than another. There are so many geometries, so many logics, so many physical and chemical hypotheses, so many classifications, each one of them good for so much and yet not good for everything, that the notion that even the truest formula may be a human device and not a literal transcript has dawned upon us. We hear scientific laws now treated as so much 'conceptual shorthand', true so far as they are useful but no farther. Our mind has become tolerant of symbol instead of reproduction, of approximation instead of exactness, of plasticity instead of rigor. 'Energetics', measuring the bare face of sensible phenomena so as to describe in a single formula all their changes of 'level', is the last word of this scientific humanism, which indeed leaves queries enough outstanding as to the reason for so curious a congruence between the world and the mind, but which at any rate makes our whole notion of scientific truth more flexible and genial than it used to be.

It is to be doubted whether any theorizer to-day, either in mathematics, logic, physics or biology, conceives himself to be literally re-editing processes of nature or thoughts of God. The main forms of our thinking, the separation

of subjects from predicates, the negative, hypothetic and disjunctive judgments, are purely human habits. The ether, as Lord Salisbury said, is only a noun for the verb to undulate; and many of our theological ideas are admitted, even by those who call them 'true', to be humanistic in like degree.

I fancy that these changes in the current notions of truth are what originally gave the impulse to Messrs. Dewey's and Schiller's views. The suspicion is in the air nowadays that the superiority of one of our formulas to another may not consist so much in its literal 'objectivity', as in subjective qualities like its usefulness, its 'elegance' or its congruity with our residual beliefs. Yielding to these suspicions, and generalizing, we fall into something like the humanistic state of mind. Truth we conceive to mean everywhere, not duplication, but addition; not the constructing of inner copies of already complete realities, but rather the collaborating with realities so as to bring about a clearer result. Obviously this state of mind is at first full of vagueness and ambiguity. 'Collaborating' is a vague term; it must at any rate cover conceptions and logical arrangements. 'Clearer' is vaguer still. Truth must bring clear thoughts, as well as clear the way to action. 'Reality' is the vaguest term of all. The only way to test such a programme at all is to apply it to the various types of truth, in the hope of reaching an account that shall be more precise. Any hypothesis that forces such a review upon one has one great merit, even if in the end it prove invalid: it gets us better acquainted with the total subject. To give the theory plenty of 'rope' and see if it hangs itself eventually is better tactics than to choke it off at the outset by abstract accusations of self-contradiction. I think therefore that a decided effort at sympathetic mental play with humanism is the provisional attitude to be recommended to the reader.

When I find myself playing sympathetically with humanism, something like what follows is what I end by conceiving it to mean.

Experience is a process that continually gives us new material to digest. We handle this intellectually by the mass of beliefs of which we find ourselves already possessed, assimilating, rejecting, or rearranging in different degrees. Some of the apperceiving ideas are recent acquisitions of our own, but most of them are common-sense traditions of the race. There is probably not a common-sense tradition, of all those which we now live by, that was not in the first instance a genuine discovery, an inductive generalization like those more recent ones of the atom, of inertia, of energy, of reflex action, or of fitness to survive. The notions of one Time and of one Space as single continuous receptacles; the distinction between thoughts and things, matter and mind; between permanent subjects and changing attributes; the conception of classes with subclasses within them; the separation of fortuitous from regularly caused connections; surely all these were once definite conquests made at historic dates by our ancestors in their attempts to get the chaos of their crude individual experiences into a more shareable and manageable shape. They proved of such sovereign use as that they are now

a part of the very structure of our mind. We cannot play fast and loose with them. No experience can upset them. On the contrary, they apperceive every experience and assign it to its place.

To what effect? That we may the better foresee the course of our experiences, communicate with one another, and steer our lives by rule. Also that we may have a cleaner, clearer, more inclusive mental view.

The greatest common-sense achievement, after the discovery of one Time and one Space, is probably the concept of permanently existing things. When a rattle first drops out of the hand of a baby, he does not look to see where it has gone. Non-perception he accepts as annihilation until he finds a better belief. That our perceptions mean rattles that are there whether we hold them in our hands or not, becomes an interpretation so luminous of what happens to us that, once employed, it never gets forgotten. It applies with equal felicity to things and persons, to the objective and to the ejective realm. However a Berkeley, a Mill, or a Cornelius may criticise it, it *works*; and in practical life we never think of 'going back' upon it, or reading our incoming experiences in any other terms. We may, indeed, speculatively imagine a state of 'pure' experience before the hypothesis of permanent objects behind its flux had been framed; and we can play with the idea that some primeval genius might have struck into a different hypothesis. But we cannot positively imagine today what the different hypothesis could have been, for the category of transperceptual reality is now one of the foundations of our life. Our thoughts must still employ it if they are to possess reasonableness and truth.

This notion of a in the shape of a most chaotic pure experience which sets us questions, of a *second* in the way of fundamental categories, long ago wrought into the structure of our consciousness and practically irreversible, which define the general frame within which answers must fall, and of *a* which gives the detail of the answers in the shapes most congruous with all our present needs, is, as I take it, the essence of the humanistic conception. It represents experience in its pristine purity to be now so enveloped in predicates historically worked out that we can think of it as little more than an of *a* which the mind, in Mr. Bradley's phrase, 'encounters', and to whose stimulating presence we respond by ways of thinking which we call 'true' in proportion as they facilitate our mental or physical activities and bring us outer power and inner peace. But whether the Other, the universal has itself any definite inner structure, or whether, if it have any, the structure resembles any of our predicates this is a question which humanism leaves untouched. For us, at any rate, it insists, reality is an accumulation of our own intellectual inventions, and the struggle for 'truth' in our progressive dealings with it is always a struggle to work in new nouns and adjectives while altering as little as possible the old.

It is hard to see why either Mr. Bradley's own logic or his metaphysics should oblige him to quarrel with this conception. He might consistently

adopt it if he would, and simply throw his peculiar absolute round it, following in this the good example of Professor Royce. Bergson in France, and his disciples, Wilbois the physicist and Leroy, are thoroughgoing humanists in the sense defined. Professor Milhaud also appears to be one; and the great Poincaré misses it by only the breadth of a hair. In Germany the name of Simmel offers itself as that of a humanist of the most radical sort. Mach and his school, and Hertz and Ostwald must be classed as humanists. The view is in the atmosphere and must be patiently discussed.

The best way to discuss it would be to see what the alternative might be. What is it indeed? Its critics make no explicit statement, Professor Royce being the only one so far who has formulated anything definite. The first service of humanism to philosophy accordingly seems to be that it will probably oblige those who dislike it to search their own hearts and heads. It will force analysis to the front and make it the order of the day. At present the lazy tradition that truth is seems all there is to contradict it with. Mr. Bradley's only suggestion is that true thought 'must correspond to a determinate being which it cannot be said to make', and obviously that sheds no new light. What is the meaning of the word to 'correspond'? Where is the 'being'? What sort of things are, 'determinations', and what is meant in this particular case by 'not to make'?

Humanism proceeds immediately to refine upon the looseness of these epithets. We correspond in *some* way with anything with which we enter into any relations at all. If it be a thing, we may produce an exact copy of it, or we may simply feel it as an existent in a certain place. If it be a demand, we may obey it without knowing anything more about it than its push. If it be a proposition, we may agree by not contradicting it, by letting it pass. If it be a relation between things, we may act on the first thing so as to bring ourselves out where the second will be. If it be something inaccessible, we may substitute a hypothetical object for it, which, having the same consequences, will cipher out for us real results. In a general way we may simply to it; and and the whole situation harmoniously prolongs and enriches itself, the thought will pass for true.

As for the whereabouts of the beings thus corresponded to, although they may be outside of the present thought as well as in it, humanism sees no ground for saying they are outside of finite experience itself. Pragmatically, their reality means that we submit to them, take account of them, whether we like to or not, but this we must perpetually do with experiences other than our own. The whole system of what the present experience must correspond to 'adequately' may be continuous with the present experience itself. Reality, so taken as experience other than the present, might be either the legacy of past experience or the content of experience to come. Its determinations for are in any case the adjectives which our acts of judging fit to it, and those are essentially humanistic things.

To say that our thought does not 'make' this reality means pragmatically that if our own particular thought were annihilated the reality would still be there in some shape, though possibly it might be a shape that would lack something that our thought supplies. That reality is 'independent' means that there is something in every experience that escapes our arbitrary control. If it be a sensible experience it coerces our attention; if a sequence, we cannot invert it; if we compare two terms we can come to only one result. There is a push, an urgency, within our very experience, against which we are on the whole powerless, and which drives us in a direction that is the destiny of our belief. That this drift of experience itself is in the last resort due to something independent of all possible experience may or may not be true. There may or may not be an extra-experiential 'ding an sich' that keeps the ball rolling, or an 'absolute' that lies eternally behind all the successive determinations which human thought has made. But within our experience at any rate, humanism says, some determinations show themselves as being independent of others; some questions, if we ever ask them, can only be answered in one way; some beings, if we ever suppose them, must be supposed to have existed previously to the supposing; some relations, if they exist ever, must exist as long as their terms exist.

Truth thus means, according to humanism, the relation of less fixed parts of experience (predicates) to other relatively more fixed parts (subjects); and we are not required to seek it in a relation of experience as such to anything beyond itself. We can stay at home, for our behavior as experients is hemmed in on every side. The forces both of advance and of resistance are exerted by our own objects, and the notion of truth as something opposed to waywardness or license inevitably grows up solipsistically inside of every human life.

So obvious is all this that a common charge against the humanistic authors 'makes me tired'. "How can a deweyite discriminate sincerity from bluff?" was a question asked at a philosophic meeting where I reported on Dewey's can the mere[2] pragmatist feel any duty to think truly?" is the objection urged by Professor Royce. Mr. Bradley in turn says that if a humanist understands his own doctrine, he "must hold ... any idea, however mad, to be the truth, if any one will have it so." And Professor Taylor describes pragmatism as believing anything one pleases and calling it truth.

Such a shallow sense of the conditions under which men's thinking actually goes on seems to me most surprising. These critics appear to suppose that, if left to itself, the rudderless raft of our experience must be ready to drift anywhere or nowhere. Even tho there were compasses on board, they seem to say, there would be no pole for them to point to. There must be absolute

[2] I know of no 'mere' pragmatist, if here means, as it seems, the denial of all concreteness to the pragmatist's thought.

sailing-directions, they insist, decreed from outside, and an independent chart of the voyage added to the 'mere' voyage itself, if we are ever to make a port. But is it not obvious that even tho there be such absolute sailing-directions in the shape of pre-human standards of truth that we to follow, the only guarantee that we shall in fact follow them must lie in our human equipment. The 'ought' would be a there were a felt grain inside of our experience that conspired. As a matter of fact the devoutest believers in absolute standards must admit that men fail to obey them. Waywardness is here, in spite of the eternal prohibitions, and the existence of any amount of reality no warrant against unlimited error *in* being incurred. The only guarantee we have against licentious thinking is the circumpressure of experience itself, which gets us sick of concrete errors, whether there be a trans-empirical reality or not. How does the partisan of absolute reality know what this orders him to think? He cannot get direct sight of the absolute; and he has no means of guessing what it wants of him except by following the humanistic clues. The only truth that he himself will ever practically be that to which his finite experiences lead him of themselves. The state of mind which shudders at the idea of a lot of experiences left to themselves, and that augurs protection from the sheer name of an absolute, as if, however inoperative, that might still stand for a sort of ghostly security, is like the mood of those good people who, whenever they hear of a social tendency that is damnable, begin to redden and to puff, and say 'Parliament or Congress ought to make a law against it', as if an impotent decree would give relief.

All the *sanctions* of a law of truth lie in the very texture of experience. Absolute or no absolute, the concrete truth *for us* will always be that way of thinking in which our various experiences most profitably combine.

And yet, the opponent obstinately urges, your humanist will always have a greater liberty to play fast and loose with truth than will your believer in an independent realm of reality that makes the standard rigid. If by this latter believer he means a man who pretends to know the standard and who fulminates it, the humanist will doubtless prove more flexible; but no more flexible than the absolutist himself if the latter follows (as fortunately our present-day absolutists do follow) empirical methods of inquiry in concrete affairs. To consider hypotheses is surely always better than to dogmatize.

Nevertheless this probable flexibility of temper in him has been used to convict the humanist of sin. Believing as he does, that truth lies and is at every moment our own line of most propitious reaction, he stands forever debarred, as I have heard a learned colleague say, from trying to convert opponents, for does not their view, being most propitious momentary reaction, already fill the bill? Only the believer in the brand of truth can on this theory seek to make converts without self-stultification. But can there be self-stultification in urging any account whatever of truth? Can the definition ever contradict the deed? "Truth is what I feel like saying" – suppose that to be the definition.

"Well, I feel like saying that, and I want you to feel like saying it, and shall continue to say it until I get you to agree." Where is there any contradiction? Whatever truth may be said to be, that is the kind of truth which the saying can be held to carry. The which a saying may comport is an extra-logical matter. It may indeed be hotter in some individual absolutist than in a humanist, but it need not be so in another. And the humanist, for his part, is perfectly consistent in compassing sea and land to make one proselyte, if his nature be enthusiastic enough.

"But how be enthusiastic over any view of things which you know to have been partly made by yourself, and which is liable to alter during the next minute? How is any heroic devotion to the ideal of truth possible under such paltry conditions?"

This is just another of those objections by which the anti-humanists show their own comparatively slack hold on the realities of the situation. If they would only follow the pragmatic method and ask: "What is truth? What does its existence stand for in the way of concrete goods?" – they would see that the name of it is the of almost everything that is valuable in our lives. The true is the opposite of whatever is instable, of whatever is practically disappointing, of whatever is useless, of whatever is lying and unreliable, of whatever is unverifiable and unsupported, of whatever is inconsistent and contradictory, of whatever is artificial and eccentric, of whatever is unreal in the sense of being of no practical account. Here are pragmatic reasons with a vengeance why we should turn to truth – truth saves us from a world of that complexion. What wonder that its very name awakens loyal feeling! In particular what wonder that all little provisional fool's paradises of belief should appear contemptible in comparison with its bare pursuit! When absolutists reject humanism because they feel it to be untrue, that means that the whole habit of their mental needs is wedded already to a different view of reality, in comparison with which the humanistic world seems but the whim of a few irresponsible youths. Their own subjective apperceiving mass is what speaks here in the name of the eternal natures and bids them reject our humanism – as they apprehend it. Just so with us humanists, when we condemn all noble, clean-cut, fixed, eternal, rational, temple-like systems of philosophy. These contradict the nature, as our dealings with nature and our habits of thinking have so far brought us to conceive it. They seem oddly personal and artificial, even when not bureaucratic and professional in an absurd degree. We turn from them to the great unpent and unstayed wilderness of truth as we feel it to be constituted, with as good a conscience as rationalists are moved by when they turn from our wilderness into their neater and cleaner intellectual abodes.[3]

[3] [I cannot forbear quoting as an illustration of the contrast between humanist and rationalist tempers of mind, in a sphere remote from philosophy, these remarks on the

This is surely enough to show that the humanist does not ignore the character of objectivity and independence in truth. Let me turn next to what his opponents mean when they say that to be true, our thoughts must 'correspond'.

The vulgar notion of correspondence here is that the thoughts must *copy* the reality – cognitio fit p[illegible] cogniti et cognoscentis; and philosophy, without having ever fairly sat down to the question, seems to have instinctively accepted this idea: propositions are held true if they copy the eternal thought; terms are held true if they copy extra-mental realities. Implicitly, I think that the copy-theory has animated most of the criticisms that have been made on humanism.

A priori, however, it is not self-evident that the sole business of our mind with realities should be to copy them. Let my reader suppose himself to constitute for a time all the reality there is in the universe, and then to receive the announcement that another being is to be created who shall know him truly. How will he represent the knowing in advance? What will he hope it to be? I doubt extremely whether it could ever occur to him to fancy it as a mere copying. Of what use to him would an imperfect second edition of himself in the new comer's interior be? It would seem pure waste of a propitious opportunity. The demand would more probably be for something absolutely new. The reader would conceive the knowing humanistically, "the new comer," he would say, "mus[illegible] If copying be requisite to that end, let there be copying; otherwise not." The essence in any case would not be the copying, but the enrichment of the previous world.

I read the other day, in a book of Professor Eucken's, a phrase, " which seems to be pertinent here. Why may not thought's mission be to increase and elevate, rather than simply to imitate and reduplicate, existence? No one who has read Lotze can fail to remember his striking comment on the ordinary view of the secondary qualities of matter, which brands them as 'illusory' because they copy nothing in the thing. The notion of a world complete in itself, to which thought comes as a passive mirror, adding nothing to fact,

Dreyfus 'affaire', written by one who assuredly had never heard of humanism or pragmatism. "Autant que la Révolution, l'Affaire est désormais une de nos 'origines'. Si elle n'a pas fait ouvrir le gouffre, ... c'est elle du moins qui a rendu patent et visible le long travail souterrain qui, silencieusement, avait preparé la séparation entre nos deux camps d'aujourd'hui, pour écarter enfin, d'un coup soudai[illegible] France révolutionnaire et romantique si l'on veut, celle qui met très haut l'individu, qui ne veut pas qu'un juste périsse fûtce pour sauver la nation, et qui cherche la vérité dans toutes ses parties aussi bien que dans une vue d'ensemble.... Duclaux ne pouvait pas concevoir qu'on préferât quelque chose à la vérité. Mais il voyait autour de lui de fort honnêtes gens qui, mettant en balance la vie d'un homme et la raison d'Etat, lui avouaient de quel poids léger ils jugeaient une simple existence individuelle, pour innocente qu'elle fû[illegible] par Mme. Em. D., Laval, 1906, pp. 243, 247–248.]

Lotze says is irrational. Rather is thought itself a most momentous part of fact, and the whole mission of the pre-existing and insufficient world of matter may simply be to provoke thought to produce its far more precious supplement.

'Knowing', in short, may, for aught we can see beforehand to the contrary, be *only one way of getting into fruitful relations with reality*, whether copying be one of the relations or not.

It is easy to see from what special type of knowing the copy-theory arose. In our dealings with natural phenomena the great point is to be able to foretell. Foretelling, according to such a writer as Spencer, is the whole meaning of intelligence. When Spencer's 'law of intelligence' says that inner and outer relations must 'correspond', it means that the distribution of terms in our inner time-scheme and space-scheme must be an exact copy of the distribution in real time and space of the real terms. In strict theory the mental terms themselves need not answer to the real terms in the sense of severally copying them, symbolic mental terms being enough, if only the real dates and places be copied. But in our ordinary life the mental terms are images and the real ones are sensations, and the images so often copy the sensations, that we easily take copying of terms as well as of relations to be the natural significance of knowing. Meanwhile much, even of this common descriptive truth, is couched in verbal symbols. If our symbols *fit* the world, in the sense of determining our expectations rightly, they may even be the better for not copying its terms.

It seems obvious that the pragmatic account of all this routine of phenomenal knowledge is accurate. Truth here is a relation, not of our ideas to non-human realities, but of conceptual parts of our experience to sensational parts. Those thoughts are true which guide us to with sensible particulars as they occur, whether they copy these in advance or not.

From the frequency of copying in the knowledge of phenomenal fact, copying has been supposed to be the essence of truth in matters rational also. Geometry and logic, it has been supposed, must copy archetypal thoughts in the Creator. But in these abstract spheres there is no need of assuming archetypes. The mind is free to carve so many figures out of space, to make so many numerical collections, to frame so many classes and series, and it can analyze and compare so endlessly, that the very superabundance of the resulting ideas makes us doubt the 'objective' pre-existence of their models. It would be plainly wrong to suppose a God whose thought consecrated rectangular but not polar co-ordinates, or Jevons's notation but not Boole's. Yet if, on the other hand, we assume God to have thought in advance of every flight of human fancy in these directions, his mind becomes too much like a Hindoo idol with three heads, eight arms and six breasts, too much made up of superfoetation and redundancy for us to wish to copy it, and the whole notion of copying tends to evaporate from these sciences. Their

objects can be better interpreted as being created step by step by men, as fast as they successively conceive them.

If now it be asked how, if triangles, squares, square roots, genera, and the like, are but improvised human 'artefacts', their properties and relations can be so promptly known to be 'eternal', the humanistic answer is easy. If triangles and genera are of our own production we can keep them invariant. We can make them 'timeless' by expressly decreeing that on *the we* time shall exert no altering effect, that they are intentionally and it may be fictitiously abstracted from every corrupting real associate and condition. But relations between invariant objects will themselves be invariant. Such relations cannot be happenings, for by hypothesis nothing shall happen to the objects. I have tried to show in the last chapter of my *Principles of Psychology*[4] that they can only be relations of comparison. No one so far seems to have noticed my suggestion, and I am too ignorant of the development of mathematics to feel very confident of my own view. But if it were correct it would solve the difficulty perfectly. Relations of comparison are matters of direct inspection. As soon as mental objects are mentally compared, they are perceived to be either like or unlike. But once the same, always the same, once different, always different, under these timeless conditions. Which is as much as to say that truths concerning these man-made objects are necessary and eternal. We can change our conclusions only by changing our data first.

The whole fabric of the sciences can thus be treated as a man-made product. As Locke long ago pointed out, these sciences have no immediate connection with fact. Only *if* a fact can be humanized by being identified with any of these ideal objects, is what was true of the objects now true also of the facts. The truth itself meanwhile was originally a copy of nothing; it was only a relation directly perceived to obtain between two artificial mental things.[5]

We may now glance at some special types of knowing, so as to see better whether the humanistic account fits. On the mathematical and logical types we need not enlarge further, nor need we return at much length to the case of our descriptive knowledge of the course of nature. So far as this involves anticipation, tho that *may* mean copying, it need, as we saw, mean little more than 'getting ready' in advance. But with many distant and future objects, our practical relations are to the last degree potential and remote. In no sense can we now get ready for the arrest of the earth's revolution by the tidal brake, for instance; and with the past, tho we suppose ourselves to know it truly, we have no practical relations at all. It is obvious that, altho interests strictly practical have been the original starting-point of our search for true phenomenal descriptions, yet an intrinsic interest in the bare describing

[4] Vol. ii, pp. 641 ff.

[5] [Mental things which are realities of course within the mental world.]

function has grown up. We wish accounts that shall be true, whether they bring collateral profit or not. The primitive function has developed its demand for mere exercise. This theoretic curiosity seems to be the characteristically human and humanism recognizes its enormous scope. A true idea now means not only one that prepares us for an actual perception. It means also one that might prepare us for a merely possible perception, or one that, if spoken, would suggest possible perceptions to others, or suggest actual perceptions which the speaker cannot share. The of perceptions thus thought of as either actual or possible form a system which it is obviously advantageous to us to get into a stable and consistent shape; and here it is that the common-sense notion of permanent beings finds triumphant use. Beings acting outside of the thinker explain, not only his actual perceptions, past and future, but his possible perceptions and those of every one else. Accordingly they gratify our theoretic need in a supremely beautiful way. We pass from our immediate actual through them into the foreign and the potential, and back again into the future actual, accounting for innumerable particulars by a single cause. As in those circular panoramas, where a real foreground of dirt, grass, bushes, rocks and a broken-down cannon is enveloped by a canvas picture of sky and earth and of a raging battle, continuing the foreground so cunningly that the spectator can detect no joint; so these conceptual objects, added to our present perceptual reality, fuse with it into the whole universe of our belief. In spite of all berkeleyan criticism, we do not doubt that they are really there. Tho our discovery of any one of them may only date from now, we unhesitatingly say that it not only *is*, but *was* there, if, by so saying, the past appears connected more consistently with what we feel the present to be. This is historic truth. Moses wrote the Pentateuch, we think, because if he didn't, all our religious habits will have to be undone. Julius Caesar was real, or we can never listen to history again. Trilobites were once alive, or all our thought about the strata is at sea. Radium, discovered only yesterday, must always have existed, or its analogy with other natural elements, which are permanent, fails. In all this, it is but one portion of our beliefs reacting on another so as to yield the most satisfactory total state of mind. That state of mind, we say, sees truth, and the content of its deliverances we believe.

Of course, if you take the satisfactoriness concretely, as something felt by you now, and if, by truth, you mean truth taken abstractly and verified in the long run, you cannot make them equate, for it is notorious that the temporarily satisfactory is often false. Yet at each and every concrete moment, truth for each man is what that man 'troweth' at that moment with the maximum of satisfaction to himself; and similarly, abstract truth, truth verified by the long run, and abstract satisfactoriness, long-run satisfactoriness, coincide. If, in short, we compare concrete with concrete and abstract with abstract, the true and the satisfactory do mean the same thing.

I suspect that a certain muddling of matters hereabouts is what makes the general philosophic public so impervious to humanism's claims.

The fundamental fact about our experience is that it is a process of change. For the 'trower' at any moment, truth, like the visible area round a man walking in a fog, or like what George Eliot calls "the wall of dark seen by small fishes eyes that pierce a span in the wide Ocean," is an objective field which the next moment enlarges and of which it is the critic, and which then either suffers alteration or is continued unchanged. The critic sees both the first trower's truth and his own truth, compares them with each other, and verifies or confutes. *His* field of view is the reality independent of that earlier trower's thinking with which that thinking ought to correspond. But the critic is himself only a trower; and if the whole process of experience should terminate at that instant, there would be no otherwise known independent reality with which *his* thought might be compared.

The immediate in experience is always provisionally in this situation. The humanism, for instance, which I see and try so hard to defend, is the completest truth attained from my point of view up to date. But, owing to the fact that all experience is a process, no point of view can ever be last one. Every one is insufficient and off its balance, and responsible to later points of view than itself. You, occupying some of these later points in your own person, and believing in the reality of others, will not agree that my point of view sees truth positive, truth timeless, truth that counts, unless they verify and confirm what it sees.

You generalize this by saying that any opinion, however satisfactory, can count positively and absolutely as true only so far as it agrees with a standard beyond itself; and if you then forget that this standard perpetually grows up endogenously inside the web of the experiences, you may carelessly go on to say that what distributively holds of each experience, holds also collectively of all experience, and that experience as such and in its totality owes whatever truth it may be possessed-of to its correspondence with absolute realities outside of its own being. This evidently is the popular and traditional position. From the fact that finite experiences must draw support from one another, philosophers pass to the notion that experience must need an absolute support. The denial of such a notion by humanism lies probably at the root of most of the dislike which it incurs.

But is this not the globe, the elephant and the tortoise over again? Must not something end by supporting itself? Humanism is willing to let finite experience be self-supporting. Somewhere being must immediately breast nonentity. Why may not the advancing front of experience, carrying its immanent satisfactions and dissatisfactions, cut against the black inane as the luminous orb of the moon cuts the caerulean abyss? Why should anywhere the world be absolutely fixed and finished? And if reality genuinely grows, why may it not grow in these very determinations which here and now are made?

In point of fact it actually seems to grow by our mental determinations, be these never so 'true'. Take the 'great bear' or 'dipper' constellation in the heavens. We call it by that name, we count the stars and call them seven, we say they were seven before they were counted, and we say that whether any one had ever noted the fact or not, the dim resemblance to a long-tailed (or long-necked?) animal was always truly there. But what do we mean by this projection into past eternity of recent human ways of thinking? Did an 'absolute' thinker actually do the counting, tell off the stars upon his standing number-tally, and make the bear-comparison, silly as the latter is? Were they explicitly seven, explicitly bear-like, before the human witness came? Surely nothing in the truth of the attributions drives us to think this. They were only implicitly or virtually what we call. them, and we human witnesses first explicated them and made them 'real'. A fact virtually pre-exists when every condition of its realization save one is already there. In this case the condition lacking is the act of the counting and comparing mind. But the stars (once the mind considers them) themselves dictate the result. The counting in no wise modifies their previous nature, and, they being what and where they are, the count cannot fall out differently. It could then be made the number seven be, questioned.

We have here a quasi-paradox. Undeniably something comes by the counting that was not there before. And yet that something In one sense you create it, and in another sense you it. You have to treat your count as being true beforehand, the moment you come to treat the matter at all.

Our stellar attributes must always be called true, then; yet none the less are they genuine additions made by our intellect to the world of fact. Not additions of consciousness only, but additions of 'content'. They copy nothing that pre-existed, yet they agree with what preexisted, fit it, amplify it, relate and connect it with a 'wain', a number-tally, or what not, and build it out. It seems to me that humanism is the only theory that builds this case out in the good direction, and this case stands for innumerable other kinds of case. In all such cases, odd as it may sound, our judgment may actually be said to retroact and to enrich the past.

Our judgments at rate change the character of *future* reality by the acts to which they lead. Where these acts are acts expressive of trust – trust, *e.g.*, that a man is honest, that our health is good enough, or that we can make a successful effort – which acts may be a needed antecedent of the trusted things becoming true, Professor Taylor says[6] that our trust is at any rate before the action; and I seem to remember that he disposes of anything like a faith in the general excellence of the universe (making the faithful person's part in it at

[6] In an article criticizing Pragmatism (as he conceives it) in the *McGill* published at Montreal, for May, 1904.

any rate more excellent) as a 'lie in the soul'. But the pathos of this expression should not blind us to the complication of the facts. I doubt whether Professor Taylor would himself be in favor of practically handling trusters of these kinds as liars. Future and present really mix in such emergencies, and one can always escape lies in them by using hypothetic forms. But Mr. Taylor's attitude suggests such absurd possibilities of practice that it seems to me to illustrate beautifully how self-stultifying the conception of a truth that shall merely register a standing fixture may become. Theoretic truth, truth of passive copying, sought in the sole interests of copying as such, not because copying i but because copying ought to be, seems, if you look at it coldly, to be an almost preposterous ideal. Why should the universe, existing in itself, also exist in copies? How it be copied in the solidity of its objective fulness? And even if it could, what would the motive be? "Even the hairs of your head are numbered." Doubtless they are, virtually; but why, as an absolute proposition, the number to become copied and known? Surely knowing is only one way of interacting with reality and adding to its effect.

The opponent here will ask: "Has not the knowing of truth any substantive value on its own account, apart from the collateral advantages it may bring? And if you allow theoretic satisfactions to exist at all, do they not crowd the collateral satisfactions out of house and home, and must not pragmatism go into bankruptcy, if she admits them at all?" The destructive force of such talk disappears as soon as we use words concretely instead of abstractly, and ask, in our quality of good pragmatists, just what the famous theoretic needs are known as and in what the intellectual satisfactions consist.

Are they not all mere matters of – and emphatically of consistency between an absolute reality and the mind's copies of it, but of actually felt consistency among judgments, objects, and habits of reacting, in the mind's own experienceable world? And are not both our need of such consistency and our pleasure in it conceivable as outcomes of the natural fact that we are beings that do develop mental – habit itself proving adaptively beneficial in an environment where the same objects, or the same kinds of objects, recur and follow 'law'? If this were so, what would have come first would have been the collateral profits of habit as such, and the theoretic life would have grown up in aid of these. In point of fact, this seems to have been the probable case. At life's origin, any present perception may have been 'true' – if such a word could then be applicable. Later, when reactions became organized, the reactions became 'true' whenever expectation was fulfilled by them. Otherwise they were 'false' or 'mistaken' reactions. But the same class of objects needs the same kind of reaction, so the impulse to react consistently must gradually have been established, and a disappointment felt whenever the results frustrated expectation. Here is a perfectly plausible germ for all our higher consistencies. Nowadays, if an object claims from us a reaction of the kind habitually accorded only to the opposite class of objects, our mental

machinery refuses to run smoothly. The situation is intellectually unsatisfactory.

Theoretic truth thus falls the mind, being the accord of some of its processes and objects with other processes and objects – 'accord' consisting here in well-definable relations. So long as the satisfaction of feeling such an accord is denied us, whatever collateral profits may seem to inure from what we believe in are but as dust in the balance – provided always that we are highly organized intellectually, which the majority of us are not. The amount of accord which satisfies most men and women is merely the absence of violent clash between their usual thoughts and statements and the limited sphere of sense-perceptions in which their lives are cast. The theoretic truth that most of us think we 'ought' to attain to is thus the possession of a set of predicates that do not explicitly contradict their subjects. We preserve it as often as not by leaving other predicates and subjects out.

In some men theory is a passion, just as music is in others. The form of inner consistency is pursued far beyond the line at which collateral profits stop. Such men systematize and classify and schematize and make synoptical tables and invent ideal objects for the pure love of unifying. Too often the results, glowing with 'truth' for the inventors, seem pathetically personal and artificial to bystanders. Which is as much as to say that the purely theoretic criterion of truth can leave us in the lurch as easily as any other criterion, and that the absolutists, for all their pretensions, are 'in the same boat' concretely with those whom they attack.

I am well aware that this paper has been rambling in the extreme. But the whole subject is inductive, and sharp logic is hardly yet in order. My great trammel has been the non-existence of any definitely stated alternative on my opponents' part. It may conduce to clearness if I recapitulate, in closing, what I conceive the main points of humanism to be. They are these:

1. An experience, perceptual or conceptual, must conform to reality in order to be true.

2. By 'reality' humanism means nothing more than the other conceptual or perceptual experiences with which a given present experience may find itself in point of fact mixed up.[7]

3. By 'conforming', humanism means taking account-of in such a way as to gain any intellectually and practically satisfactory result.

4. To 'take account-of' and to be 'satisfactory' are terms that admit of no definition, so many are the ways in which these requirements can practically be worked out.

[7] This is meant merely to exclude reality of an 'unknowable' sort, of which no account in either perceptual or conceptual terms can be given. It includes of course any amount of empirical reality independent of the knower. Pragmatism is thus 'epistemologically' realistic in its account.

5. Vaguely and in general, we take account of a reality by it in as unmodified a form as possible. But, to be then satisfactory, it must not contradict other realities outside of it which claim also to be preserved. That we must preserve all the experience we can and minimize contradiction in what we preserve, is about all that can be said in advance.

6. The truth which the conforming experience embodies may be a positive addition to the previous reality, and later judgments may have to conform to *it*. Yet, virtually at least, it may have been true previously. Pragmatically, virtual and actual truth mean the same thing: the possibility of only one answer, *wher*

THE PRAGMATIST ACCOUNT OF TRUTH AND ITS MISUNDERSTANDERS

William James, "The Pragmatist Account of Truth and its Misunderstanders." *The Meaning of Truth* (New York: Longmans, Green, and Co., 1909), chap. 8, pp. 180–216.

The account of truth given in my volume entitled *Pragmatism*, continues to meet with such persistent misunderstanding that I am tempted to make a final brief reply. My ideas may well deserve refutation, but they can get none till they are conceived of in their proper shape. The fantastic character of the current misconceptions shows how unfamiliar is the concrete point of view which pragmatism assumes. Persons who are familiar with a conception move about so easily in it that they understand each other at a hint, and can converse without anxiously attending to their P's and Q's. I have to admit, in view of the results, that we have assumed too ready an intelligence, and consequently in many places used a language too slipshod. We should never have spoken elliptically. The critics have boggled at every word they could boggle at, and refused to take the spirit rather than the letter of our discourse. This seems to show a genuine unfamiliarity in the whole point of view. It also shows, I think, that the second stage of opposition, which has already begun to express itself in the stock phrase that 'what is new is not true, and what is true not new', in pragmatism, is insincere. If we said nothing in any degree new, why was our meaning so desperately hard to catch? The blame, cannot be laid wholly upon our obscurity of speech, for in other subjects we have attained to making ourselves understood. But recriminations are tasteless; and, as far as I personally am concerned, I am sure that some of the misconception I complain of is due to my doctrine of truth being surrounded in that volume of popular lectures by a lot of other opinions not necessarily implicated with it, so that a reader may very naturally have grown confused. For this I am to blame – likewise for omitting certain explicit cautions, which the pages that follow will now in part supply.

First misunderstanding: Pragmatism is only a re-editing of positivism.
This seems the commonest mistake. Scepticism, positivism, and agnosticism agree with ordinary dogmatic rationalism in presupposing that everybody

knows what the word 'truth' means, without further explanation. But the former doctrines then either suggest or declare that real truth, absolute truth, is inaccessible to us, and that we must fain put up with relative or phenomenal truth as its next best substitute. By scepticism this is treated as an unsatisfactory state of affairs, while positivism and agnosticism are cheerful about it, call real truth sour grapes, and consider phenomenal truth quite sufficient for all our 'practical' purposes.

In point of fact, nothing could be farther from all this than what pragmatism has to say of truth. Its thesis is an altogether previous one. It leaves off where these other theories begin, having contented itself with the word truth's *definition*. "No matter whether any mind extant in the universe possess truth or not," it asks, "what does the notion of truth signify *ideally*?" "What kind of things would true judgments be *in case* they existed?" The answer which pragmatism offers is intended to cover the most complete truth that can be conceived of, 'absolute' truth if you like, as well as truth of the most relative and imperfect description. This question of what truth would be like if it did exist, belongs obviously to a purely speculative field of inquiry. It is not a theory about any sort of reality, or about what kind of knowledge is actually possible; it abstracts from particular terms altogether, and defines the nature of a possible relation between two of them.

As Kant's question about synthetic judgments had escaped previous philosophers, so the pragmatist question is not only so subtile as to have escaped attention hitherto, but even so subtile, it would seem, that when openly broached now, dogmatists and sceptics alike fail to apprehend it, and deem the pragmatist to be treating of something wholly different. He insists, they say (I quote an actual critic), "that the greater problems are insoluble by human intelligence, that our need of knowing truly is artificial and illusory, and that our reason, incapable of reaching the foundations of reality, must turn itself exclusively towards *action*." There could not be a worse misapprehension.

Second misunderstanding: Pragmatism is primarily an appeal to action. The name 'pragmatism', with its suggestions of action, has been an unfortunate choice, I have to admit, and has played into the hands of this mistake. But no word could protect the doctrine from critics so blind to the nature of the inquiry that, when Dr. Schiller speaks of ideas 'working' well, the only thing they think of is their immediate workings in the physical environment, their enabling us to make money, or gain some similar 'practical' advantage. Ideas do work thus, of course, immediately or remotely; but they work indefinitely inside of the mental world also. Not crediting us with this rudimentary insight, our critics treat our view as offering itself exclusively to engineers, doctors, financiers, and men of action generally, who need some sort of a

rough and ready *weltanschauung*, but have no time or wit to study genuine philosophy. It is usually described as a characteristically American movement, a sort of bobtailed scheme of thought, excellently fitted for the man on the street, who naturally hates theory and wants cash returns immediately.

It is quite true that, when the refined theoretic question that pragmatism begins with is once answered, secondary corollaries of a practical sort follow. Investigation shows that, in the function called truth, previous realities are not the only independent variables. To a certain extent our ideas, being realities, are also independent variables, and, just as they follow other reality and fit it, so, in a measure, does other reality follow and fit them. When they add themselves to being, they partly redetermine the existent, so that reality as a whole appears incompletely definable unless ideas also are kept account of. This pragmatist doctrine, exhibiting our ideas as complemental factors of reality, throws open (since our ideas are instigators of our action) a wide window upon human action, as well as a wide license to originality in thought. But few things could be sillier than to ignore the prior epistemological edifice in which the window is built, or to talk as if pragmatism began and ended at the window. This, nevertheless, is what our critics do almost without exception. They ignore our primary step and its motive, and make the relation to action, which is our secondary achievement, primary.

Third misunderstanding: Pragmatists cut themselves off from the right to believe in ejective realities.

They do so, according to the critics, by making the truth of our beliefs consist in their verifiability, and their verifiability in the way in which they do work for us. Professor Stout, in his otherwise admirable and hopeful review of Schiller in *Mind* for October, 1907, considers that this ought to lead Schiller (could he sincerely realize the effects of his own doctrine) to the absurd consequence of being unable to believe genuinely in another man's headache, even were the headache there. He can only 'postulate' it for the sake of the working value of the postulate to himself. The postulate guides certain of his acts and leads to advantageous consequences; but the moment he understands fully that the postulate is true *only* (!) in this sense, it ceases (or should cease) to be true for him that the other man really *has* a headache. All that makes the postulate most precious then evaporates: his interest in his fellow-man "becomes a veiled form of self-interest, and his world grows cold, dull, and heartless."

Such an objection makes a curious muddle of the pragmatist's universe of discourse. Within that universe the pragmatist finds some one with a headache or other feeling, and some one else who postulates that feeling. Asking on what condition the postulate is 'true', the pragmatist replies that, for the postulator at any rate, it is true just in proportion as to believe in it works in him

the fuller sum of satisfactions. What is it that is satisfactory here? Surely to *believe* in the postulated object, namely, in the really existing feeling of the other man. But how (especially if the postulator were himself a thoroughgoing pragmatist) could it ever be satisfactory to him *not* to believe in that feeling, so long as, in Professor Stout's words, disbelief "made the world seem to him cold, dull, and heartless"? Disbelief would seem, on pragmatist principles, quite out of the question under such conditions, unless the heartlessness of the world were made probable already on other grounds. And since the belief in the headache, true for the subject assumed in the pragmatist's universe of discourse, is also true for the pragmatist who for his epitemologizing purposes has assumed that entire universe, why is it not true in that universe absolutely? The headache believed in is a reality there, and no extant mind disbelieves it, neither the critic's mind nor his subject's! Have our opponents any better brand of truth in this real universe of ours that they can show us?[1]

So much for the third misunderstanding, which is but one specification of the following still wider one.

Fourth misunderstanding: No pragmatist can be a realist in his epistemology. This is supposed to follow from his statement that the truth of our beliefs consists in general in their giving satisfaction. Of course satisfaction *per se* is a subjective condition; so the conclusion is drawn that truth falls wholly inside

[1] I see here a chance to forestall a criticism which some one may make on Lecture III of my *Pragmatism*, where, on pp. 96–100, I said that 'God' and 'Matter' might be regarded as synonymous terms, so long as no differing future consequences were deducible from the two conceptions. The passage was transcribed from my address at the California Philosophical Union, reprinted in the *Journal of Philosophy*, vol. 1, p. 673. I had no sooner given the address than I perceived a flaw in that part of it; but I have left the passage unaltered ever since, because the flaw did not spoil its illustrative value. The flaw was evident when, as a case analogous to that of a godless universe, I thought of what I called an 'automatic sweetheart', meaning a soulless body which should be absolutely indistinguishable from a spiritually animated maiden, laughing, talking, blushing, nursing us, and performing all feminine offices as tactfully and sweetly as if a soul were in her. Would any one regard her as a full equivalent? Certainly not, and why? Because, framed as we are, our egoism craves above all things inward sympathy and recognition, love and admiration. The outward treatment is valued mainly as an expression, as a manifestation of the accompanying consciousness believed in. Pragmatically, then, belief in the automatic sweetheart would not *work*, and in point of fact no one treats it as a serious hypothesis. The godless universe would be exactly similar. Even if matter could do every outward thing that God does, the idea of it would not work as satisfactorily, because the chief call for a God on modern men's part is for a being who will inwardly recognize them and judge them sympathetically. Matter disappoints this craving of our ego, so God remains for most men the truer hypothesis, and indeed remains so for definite pragmatic reasons.

of the subject, who then may manufacture it at his pleasure. True beliefs become thus wayward affections, severed from all responsibility to other parts of experience.

It is difficult to excuse such a parody of the pragmatist's opinion, ignoring as it does every element but one of his universe of discourse. The terms of which that universe consists positively forbid any non-realistic interpretation of the function of knowledge defined there. The pragmatizing epistemologist posits there a reality and a mind with ideas. What, now, he asks, can make those ideas true of that reality? Ordinary epistemology contents itself with the vague statement that the ideas must 'correspond' or 'agree'; the pragmatist insists on being more concrete, and asks what such 'agreement' may mean in detail. He finds first that the ideas must point to or lead towards *that* reality and no other, and then that the pointings and leadings must yield satisfaction as their result. So far the pragmatist is hardly less abstract than the ordinary slouchy epistemologist; but as he defines himself farther, he grows more concrete. The entire quarrel of the intellectualist with him is over his concreteness, intellectualism contending that the vaguer and more abstract account is here the more profound. The concrete pointing and leading are conceived by the pragmatist to be the work of other portions of the same universe to which the reality and the mind belong, intermediary verifying bits of experience with which the mind at one end, and the reality at the other, are joined. The 'satisfaction', in turn, is no abstract satisfaction *überhaupt*, felt by an unspecified being, but is assumed to consist of such satisfactions (in the plural) as concretely existing men actually do find in their beliefs. As we humans are constituted in point of fact, we find that to believe in other men's minds, in independent physical realities, in past events, in eternal logical relations, is satisfactory. We find hope satisfactory. We often find it satisfactory to cease to doubt. Above all we find *consistency* satisfactory, consistency between the present idea and the entire rest of our mental equipment, including the whole order of our sensations, and that of our intuitions of likeness and difference, and our whole stock of previously acquired truths.

The pragmatist, being himself a man, and imagining in general no contrary lines of truer belief than ours about the 'reality' which he has laid at the base of his epistemological discussion, is willing to treat our satisfactions as possibly really true guides to it, not as guides true solely for *us*. It would seem here to be the duty of his critics to show with some explicitness why, being our subjective feelings, these satisfactions can *not* yield 'objective' truth. The beliefs which they accompany 'posit' the assumed reality, 'correspond' and 'agree' with it, and 'fit' it in perfectly definite and assignable ways, through the sequent trains of thought and action which form their verification, so merely to insist on using these words abstractly instead of concretely is no way of driving the pragmatist from the field – his more concrete account virtually

includes his critic's. If our critics have any definite idea of a truth more objectively grounded than the kind we propose, why do they not show it more articulately? As they stand, they remind one of Hegel's man who wanted 'fruit', but rejected cherries, pears, and grapes, because they were not fruit in the abstract. We offer them the full quart-pot, and they cry for the empty quart-capacity.

But here I think I hear some critic retort as follows: "If satisfactions are all that is needed to make truth, how about the notorious fact that errors are so often satisfactory? And how about the equally notorious fact that certain true beliefs may cause the bitterest dissatisfaction? Isn't it clear that not the satisfaction which it gives, but the relation of the belief *to the reality* is all that makes it true? Suppose there were no such reality, and that the satisfactions yet remained: would they not then effectively work falsehood? Can they consequently be treated distinctively as the truth-builders? It is the *inherent relation to reality* of a belief that gives us that specific *truth*-satisfaction, compared with which all other satisfactions are the hollowest humbug. The satisfaction of *knowing truly* is thus the only one which the pragmatist ought to have considered. As a *psychological sentiment*, the anti-pragmatist gladly concedes it to him, but then only as a concomitant of truth, not as a constituent. What *constitutes* truth is not the sentiment, but the purely logical or objective function of rightly cognizing the reality, and the pragmatist's failure to reduce this function to lower values is patent."

Such anti-pragmatism as this seems to me a tissue of confusion. To begin with, when the pragmatist says 'indispensable', it confounds this with 'sufficient'. The pragmatist calls satisfactions indispensable for truth-building, but I have everywhere called them insufficient unless reality be also incidentally led to. If the reality assumed were cancelled from the pragmatist's universe of discourse, he would straightway give the name of falsehoods to the beliefs remaining, in spite of all their satisfactoriness. For him, as for his critic, there can be no truth if there is nothing to be true about. Ideas are so much flat psychological surface unless some mirrored matter gives them cognitive lustre. This is why as a pragmatist I have so carefully posited 'reality' *ab initio*, and why, throughout my whole discussion, I remain an epistemological realist.[2]

The anti-pragmatist is guilty of the further confusion of imagining that, in undertaking to give him an account of what truth formally means, we are assuming at the same time to provide a warrant for it, trying to define the occasions when he can be sure of materially possessing it. Our making it hinge

[2] I need hardly remind the reader that both sense-percepts and percepts of ideal relation (comparisons, etc.) should be classed among the realities. The bulk of our mental 'stock' consists of truths concerning these terms.

on a reality so 'independent' that when it comes, truth comes, and when it goes, truth goes with it, disappoints this naive expectation, so he deems our description unsatisfactory. I suspect that under this confusion lies the still deeper one of not discriminating sufficiently between the two notions, truth and reality. Realities are not *true*, they *are*; and beliefs are true *of* them. But I suspect that in the anti-pragmatist mind the two notions sometimes swap their attributes. The reality itself, I fear, is treated as if 'true', and conversely. Whoso tells us of the one, it is then supposed, must also be telling us of the other; and a true idea must in a manner *be*, or at least *yield* without extraneous aid, the reality it cognitively is possessed of.

To this absolute-idealistic demand pragmatism simply opposes its *non possumus*. If there is to be truth, it says, both realities and beliefs about them must conspire to make it; but whether there ever is such a thing, or how anyone can be sure that his own beliefs possess it, it never pretends to determine. That truth-satisfaction *par excellence* which may tinge a belief unsatisfactory in other ways, it easily explains as the feeling of consistency with the stock of previous truths, or supposed truths, of which one's whole past experience may have left one in possession.

But are not all pragmatists sure that their own belief is right? their enemies will ask at this point; and this leads me to the

Fifth misunderstanding: What pragmatists say is inconsistent with their saying so.

A correspondent puts this objection as follows: "When you say to your audience, 'pragmatism is the truth concerning truth', the first truth is different from the second. About the first you and they are not to be at odds; you are not giving them liberty to take or leave it according as it works satisfactorily or not for their private uses. Yet the second truth, which ought to describe and include the first, affirms this liberty. Thus the *intent* of your utterance seems to contradict the *content* of it."

General scepticism has always received this same classic refutation. "You have to dogmatize," the rationalists say to the sceptics, "whenever you express the sceptical position; so your lives keep contradicting your thesis." One would suppose that the impotence of so hoary an argument to abate in the slightest degree the amount of general scepticism in the world might have led some rationalists themselves to doubt whether these instantaneous logical refutations are such fatal ways, after all, of killing off live mental attitudes. General scepticism is the live mental attitude of refusing to conclude. It is a permanent torpor of the will, renewing itself in detail towards each successive thesis that offers, and you can no more kill it off by logic than you can kill off obstinacy or practical joking. This is why it is so irritating. Your consistent sceptic never puts his scepticism into a formal proposition – he

simply chooses it as a habit. He provokingly hangs back when he might so easily join us in saying yes, but he is not illogical or stupid – on the contrary, he often impresses us by his intellectual superiority. This is the *real* scepticism that rationalists have to meet, and their logic does not even touch it.

No more can logic kill the pragmatist's behavior: his act of utterance, so far from contradicting, accurately exemplifies the matter which he utters. What is the matter which he utters? In part, it is this, that truth, concretely considered, is an attribute of our beliefs, and that these are attitudes that follow satisfactions. The ideas around which the satisfactions cluster are primarily only hypotheses that challenge or summon a belief to come and take its stand upon them. The pragmatist's idea of truth is just such a challenge. He finds it ultra-satisfactory to accept it, and takes his own stand accordingly. But, being gregarious as they are, men seek to spread their beliefs, to awaken imitation, to infect others. Why should not *you* also find the same belief satisfactory? thinks the pragmatist, and forthwith endeavors to convert you. You and he will then believe similarly; you will hold up your subject-end of a truth, which will be a truth objective and irreversible if the reality holds up the object-end by being itself present simultaneously. What there is of self-contradiction in all this I confess I cannot discover. The pragmatist's conduct in his own case seems to me on the contrary admirably to illustrate his universal formula; and of all epistemologists, he is perhaps the only one who is irreproachably self-consistent.

Sixth misunderstanding: Pragmatism explains not what truth is, but only how it is arrived at.

In point of fact it tells us both, tells us what it is incidentally to telling us how it is arrived at – for what *is* arrived at except just what the truth is? If I tell you how to get to the railroad station, don't I implicitly introduce you to the *what*, to the being and nature of that edifice? It is quite true that the abstract *word* 'how' hasn't the same meaning as the abstract *word* 'what', but in this universe of concrete facts you cannot keep hows and whats asunder. The reasons why I find it satisfactory to believe that any idea is true, the *how* of my arriving at that belief, may be among the very reasons why the idea *is* true in reality. If not, I summon the anti-pragmatist to explain the impossibility articulately.

His trouble seems to me mainly to arise from his fixed inability to understand how a concrete statement can possibly mean as much, or be as valuable, as an abstract one. I said above that the main quarrel between us and our critics was that of concreteness *versus* abstractness. This is the place to develop that point farther.

In the present question, the links of experience sequent upon an idea, which mediate between it and a reality, form and for the pragmatist indeed

are, the *concrete* relation of truth that may obtain between the idea and that reality. They, he says, are all that we mean when we speak of the idea 'pointing' to the reality, 'fitting' it, 'corresponding' with it, or 'agreeing' with it – they or other similar mediating trains of verification. Such mediating events *make* the idea 'true'. The idea itself, if it exists at all, is also a concrete event: so pragmatism insists that truth in the singular is only a collective name for truths in the plural, these consisting always of series of definite events; and that what intellectualism calls *the* truth, the *inherent* truth, of any one such series is only the abstract name for its truthfulness in act, for the fact that the ideas there do lead to the supposed reality in a way that we consider satisfactory.

The pragmatist himself has no objection to abstractions. Elliptically, and 'for short', he relies on them as much as any one, finding upon innumerable occasions that their comparative emptiness makes of them useful substitutes for the overfulness of the facts he meets with. But he never ascribes to them a higher grade of reality. The full reality of a truth for him is always some process of verification, in which the abstract property of connecting ideas with objects truly is workingly embodied. Meanwhile it is endlessly serviceable to be able to talk of properties abstractly and apart from their working, to find them the same in innumerable cases, to take them 'out of time', and to treat of their relations to other similar abstractions. We thus form whole universes of platonic ideas *ante rem*, universes *in posse*, tho none of them exists effectively except *in rebus*. Countless relations obtain there which nobody experiences as obtaining – as, in the eternal universe of musical relations, for example, the notes of Aennchen von Tharau were a lovely melody long ere mortal ears ever heard them. Even so the music of the future sleeps now, to be awakened hereafter. Or, if we take the world of geometrical relations, the thousandth decimal of π sleeps there, tho no one may ever try to compute it. Or, if we take the universe of 'fitting', countless coats 'fit' backs, and countless boots 'fit' feet, on which they are not practically *fitted*; countless stones 'fit' gaps in walls into which no one seeks to fit them actually. In the same way countless opinions 'fit' realities, and countless truths are valid, tho no thinker ever thinks them.

For the anti-pragmatist these prior timeless relations are the presupposition of the concrete ones, and possess the profounder dignity and value. The actual workings of our ideas in verification-processes are as naught in comparison with the 'obtainings' of this discarnate truth within them.

For the pragmatist, on the contrary, all discarnate truth is static, impotent, and relatively spectral, full truth being the truth that energizes and does battle. Can any one suppose that the sleeping quality of truth would ever have been abstracted or have received a name, if truths had remained forever in that storage-vault of essential timeless 'agreements' and had never been embodied in any panting struggle of men's live ideas for verification? Surely no more

than the abstract property of 'fitting' would have received a name, if in our world there had been no backs or feet or gaps in walls to be actually fitted. *Existential* truth is incidental to the actual competition of opinions. *Essential* truth, the truth of the intellectualists, the truth with no one thinking it, is like the coat that fits tho no one has ever tried it on, like the music that no ear has listened to. It is less real, not more real, than the verified article; and to attribute a superior degree of glory to it seems little more than a piece of perverse abstraction-worship. As well might a pencil insist that the outline is the essential thing in all pictorial representation, and chide the paint-brush and the camera for omitting it, forgetting that *their* pictures not only contain the whole outline, but a hundred other things in addition. Pragmatist truth contains the whole of intellectualist truth and a hundred other things in addition. Intellectualist truth is then only pragmatist truth *in posse*. That on innumerable occasions men do substitute truth *in posse* or verifiability, for verification or truth in act, is a fact to which no one attributes more importance than the pragmatist: he emphasizes the practical utility of such a habit. But he does not on that account consider truth *in posse* – truth not alive enough ever to have been asserted or questioned or contradicted – to be the metaphysically prior thing, to which truths in act are tributary and subsidiary. When intellectualists do this, pragmatism charges them with inverting the real relation. Truth *in posse means* only truths in act; and he insists that these latter take precedence in the order of logic as well as in that of being.

Seventh misunderstanding: Pragmatism ignores the theoretic interest.
This would seem to be an absolutely wanton slander, were not a certain excuse to be found in the linguistic affinities of the word 'pragmatism', and in certain offhand habits of speech of ours which assumed too great a generosity on our reader's part. When we spoke of the meaning of ideas consisting in their 'practical' consequences, or of the 'practical' differences which our beliefs make to us; when we said that the truth of a belief consists in its 'working' value, etc.; our language evidently was too careless, for by 'practical' we were almost unanimously held to mean *opposed* to theoretical or genuinely cognitive, and the consequence was punctually drawn that a truth in our eyes could have no relation to any independent reality, or to any other truth, or to anything whatever but the acts which we might ground on it or the satisfactions they might bring. The mere existence of the idea, all by itself, if only its results were satisfactory, would give full truth to it, it was charged, in our absurd pragmatist epistemology. The solemn attribution of this rubbish to us was also encouraged by two other circumstances. First, ideas *are* practically useful in the narrow sense, false ideas sometimes, but most often ideas which we can verify by the sum total of all their leadings, and the reality of whose objects may thus be considered established beyond doubt.

That these ideas should be true in advance of and apart from their utility, that, in other words, their objects should be really there, is the very condition of their having that kind of utility – the objects they connect us with are so important that the ideas which serve as the objects' substitutes grow important also. This manner of their practical working was the first thing that made truths good in the eyes of primitive men; and buried among all the other good workings by which true beliefs are characterized, this kind of subsequential utility remains.

The second misleading circumstance was the emphasis laid by Schiller and Dewey on the fact that, unless a truth be relevant to the mind's momentary predicament, unless it be germane to the 'practical' situation – meaning by this the quite particular perplexity – it is no good to urge it. It doesn't meet our interests any better than a falsehood would under the same circumstances. But why our predicaments and perplexities might not be theoretical here as well as narrowly practical, I wish that our critics would explain. They simply assume that no pragmatist *can* admit a genuinely theoretic interest. Having used the phrase 'cash-value' of an idea, I am implored by one correspondent to alter it, "for every one thinks you mean only pecuniary profit and loss." Having said that the true is 'the expedient in our thinking', I am rebuked in this wise by another learned correspondent: "The word expedient has no other meaning than that of self-interest. The pursuit of this has ended by landing a number of officers of national banks in penitentiaries. A philosophy that leads to such results must be unsound."

But the word 'practical' is so habitually loosely used that more indulgence might have been expected. When one says that a sick man has now practically recovered, or that an enterprise has practically failed, one usually means just the opposite of practically in the literal sense. One means that, altho untrue in strict practice, what one says is true in theory, true virtually, *certain to be* true. Again, by the practical one often means the distinctively concrete, the individual, particular, and effective, as opposed to the abstract, general, and inert. To speak for myself, whenever I have emphasized the practical nature of truth, this is mainly what has been in my mind. 'Pragmata' are things in their plurality; and in that early California address, when I described pragmatism as holding that "the meaning of any proposition can always be brought down to some particular consequence in our future practical experience, whether passive or active," I expressly added these qualifying words: "the point lying rather in the fact that the experience must be particular than in the fact that it must be active" – by 'active' meaning here 'practical' in the narrow literal sense.[3] But particular consequences can perfectly well be

[3] The ambiguity of the word 'practical' comes out well in these words of a recent would-be reporter of our views: "Pragmatism is an Anglo-Saxon reaction against the intellectualism and rationalism of the Latin mind.... Man, each individual man is the measure

of a theoretic nature. Every remote fact which we infer from an idea is a particular theoretic consequence which our mind practically works towards. The loss of every old opinion of ours which we see that we shall have to give up if a new opinion be true, is a particular theoretic as well as a particular practical consequence. After man's interest in breathing freely, the greatest of all his interests (because it never fluctuates or remits, as most of his physical interests do), is his interest in *consistency*, in feeling that what he now thinks goes with what he thinks on other occasions. We tirelessly compare truth with truth for this sole purpose. Is the present candidate for belief perhaps contradicted by principle number one? Is it compatible with fact number two? and so forth. The particular operations here are the purely logical ones of analysis, deduction, comparison, etc.; and altho general terms may be used *ad libitum*, the satisfactory *practical working* of the candidate-idea consists in the consciousness yielded by each successive theoretic consequence in particular. It is therefore simply idiotic to repeat that pragmatism takes no account of purely theoretic interests. All it insists on is that verity in act means *verifications*, and that these are always particulars. Even in exclusively theoretic matters, it insists that vagueness and generality serve to verify nothing.

Eighth misunderstanding: Pragmatism is shut up to solipsism.
I have already said something about this misconception under the third and fourth heads, above, but a little more may be helpful. The objection is apt to clothe itself in words like these: "You make truth to consist in every value except the cognitive value proper; you always leave your knower at many removes (or, at the uttermost, at one remove) from his real object; the best you do is to let his ideas carry him towards it; it remains forever outside of him," etc.

I think that the leaven working here is the rooted intellectualist persuasion that, to know a reality, an idea must in some inscrutable fashion possess or be it.[4] For pragmatism this kind of coalescence is inessential. As a rule our cognitions are only processes of mind off their balance and in motion towards

of things. He is able to conceive none but relative truths, that is to say, illusions. What these illusions are worth is revealed to him, not by general theory, but by individual practice. Pragmatism, which consists in experiencing these illusions of the mind and obeying them by acting them out, is a *philosophy without words*, a philosophy of *gestures and of acts*, which abandons what is general and holds only to what is *particular*." (Bourdeau, in *Journal des Débats*, October 29, 1907.)

[4] Sensations may, indeed, possess their objects or coalesce with them, as common sense supposes that they do; and intuited differences between concepts may coalesce with the 'eternal' objective differences; but to simplify our discussion here we can afford to abstract from these very special cases of knowing.

real termini; and the reality of the termini, believed in by the states of mind in question, can be *guaranteed* only by some wider knower.[5] But if there is no reason extant in the universe why they should be doubted, the beliefs are true in the only sense in which anything can be true anyhow: they are practically and concretely true, namely. True in the mystical mongrel sense of an *identitätsphilosophie* they need not be; nor is there any intelligible reason why they ever need be true otherwise than verifiably and practically. It is reality's part to possess its own existence; it is thought's part to get into 'touch' with it by innumerable paths of verification.

I fear that the 'humanistic' developments of pragmatism may cause a certain difficulty here. We get at one truth only through the rest of truth; and the reality, everlastingly postulated as that which all our truth must keep in touch with, may never be given to us save in the form of truth other than that which we are now testing. But since Dr. Schiller has shown that all our truths, even the most elemental, are affected by race-inheritance with a human coefficient, reality *per se* thus may appear only as a sort of limit; it may be held to shrivel to the mere *place* for an object, and what is known may be held to be only matter of our psyche that we fill the place with.

It must be confessed that pragmatism, worked in this humanistic way, is *compatible* with solipsism. It joins friendly hands with the agnostic part of Kantism, with contemporary agnosticism, and with idealism generally. But worked thus, it is a metaphysical theory about the matter of reality, and flies far beyond pragmatism's own modest analysis of the nature of the knowing function, which analysis may just as harmoniously be combined with less humanistic accounts of reality. One of pragmatism's merits is that it is so purely epistemological. It must assume realities; but it prejudges nothing as to their constitution, and the most diverse metaphysics can use it as their foundation. It certainly has no special affinity with solipsism.

As I look back over what I have written, much of it gives me a queer impression, as if the obvious were set forth so condescendingly that readers might well laugh at my pomposity. It may be, however, that concreteness as

[5] The transcendental idealist thinks that, in some inexplicable way, the finite states of mind are identical with the transfinite all-knower which he finds himself obliged to postulate in order to supply a *fundamentum* for the relation of knowing, as he apprehends it. Pragmatists can leave the question of identity open; but they cannot do without the wider knower any more than they can do without the reality, if they want to *prove* a case of knowing. They themselves play the part of the absolute knower for the universe of discourse which serves them as material for epistemologizing. They warrant the reality there, and the subject's true knowledge, there, of it. But whether what they themselves say about that whole universe is objectively true, *i.e.*, whether the pragmatic theory of truth is true *really*, they cannot warrant – they can only believe it. To their hearers they can only *propose* it, as I propose it to my readers, as something to be verified *ambulando*, or by the way in which its consequences may confirm it.

radical as ours is not so obvious. The whole originality of pragmatism, the whole point in it, is its use of the concrete way of seeing. It begins with concreteness, and returns and ends with it. Dr. Schiller, with his two 'practical' aspects of truth, (1) relevancy to situation, and (2) subsequential utility, is only filling the cup of concreteness to the brim for us. Once seize that cup, and you cannot misunderstand pragmatism. It seems as if the power of imagining the world concretely *might* have been common enough to let our readers apprehend us better, as if they might have read between our lines, and, in spite of all our infelicities of expression, guessed a little more correctly what our thought was. But alas! this was not on fate's programme, so we can only think, with the german ditty:

> "Es wär' zu schön gewesen,
> Es hat nicht sollen sein."

THE MEANING OF THE WORD TRUTH

William James, "The Meaning of the Word Truth." (New York: Longmans, Green, and Co., 1909), chap. 9, pp. 217–220.

My account of truth is realistic, and follows the epistemological dualism of common sense. Suppose I say to you "The thing exists" – is that true or not? How can you tell? Not till my statement has developed its meaning farther is it determined as being true, false, or irrelevant to reality altogether. But if now you ask "what thing?" and I reply "a desk"; if you ask "where?" and I point to a place; if you ask "does it exist materially, or only in imagination?" and I say "materially"; if moreover I say "I mean that desk," and then grasp and shake a desk which you see just as I have described it, you are willing to call my statement true. But you and I are commutable here; we can exchange places; and, as you go bail for my desk, so I can go bail for yours.

This notion of a reality independent of either of us, taken from ordinary social experience, lies at the base of the pragmatist definition of truth. With some such reality any statement, in order to be counted true, must agree. Pragmatism defines 'agreeing' to mean certain ways of 'working', be they actual or potential. Thus, for my statement "the desk exists" to be true of a desk recognized as real by you, it must be able to lead me to shake your desk, to explain myself by words that suggest that desk to your mind, to make a drawing that is like the desk you see, etc. Only in such ways as this is there sense in saying it agrees with *that* reality, only thus does it gain for me the satisfaction of hearing you corroborate me. Reference then to something determinate, and some sort of adaptation to it worthy of the name of agreement, are thus constituent elements in the definition of any statement of mine as 'true'.

You cannot get at either the reference or the adaptation without using the notion of the workings. *That* the thing is, *what* it is, and *which* it is (of all the possible things with that what) are points determinable only by the pragmatic method. The 'which' means a possibility of pointing, or of otherwise singling out the special object; the 'what' means choice on our part of an essential aspect to conceive it by (and this is always relative to what Dewey calls our own 'situation'); and the 'that' means our assumption of the attitude of belief, the reality recognizing attitude. Surely for understanding what the word 'true' means as applied to a statement, the mention of such workings is indispensable. Surely if we leave them out the subject and the object of the

cognitive relation float – in the same universe, 'tis true – but vaguely and ignorantly and without mutual contact or mediation.

Our critics nevertheless call the workings inessential. No functional possibilities 'make' our beliefs true, they say; they are true inherently, true positively, born 'true' as the Count of Chambord was born 'Henri-Cinq'. Pragmatism insists, on the contrary, that statements and beliefs are thus inertly and statically true only by courtesy: they practically pass for true; but you *cannot define what you mean* by calling them true without referring to their functional possibilities. These give its whole *logical content* to that relation to reality on a belief's part to which the name 'truth' is applied, a relation which otherwise remains one of mere coexistence or bare withness.

The foregoing statements reproduce the essential content of the lecture on Truth in my book *Pragmatism*. Schiller's doctrine of 'humanism', Dewey's *Studies in Logical Theory*, and my own 'radical empiricism', all involve this general notion of truth as 'working', either actual or conceivable. But they envelope it as only one detail in the midst of much wider theories that aim eventually at determining the notion of what 'reality' at large is in its ultimate nature and constitution.

Section Two

Memorials and Remembrances of James

WILLIAM JAMES

Horace M. Kallen. "William James." *The Nation* 91.10 (8 September 1910): 210–211.

In William James, America loses her one philosopher whose work is studied in France and China, in Finland and Australia, wherever men are seriously concerned about human nature and human destiny. What chiefly characterizes his thought is that rarest of all qualities, intellectual justice. He was utterly free from extremes, whether of aspiration or of argument. People have been used to call this quality a defect in logical power, and to accuse him of inconsistency, but, in truth, the inconsistency is not that of the thinker, but that of the world which he interpreted; the defect was not in his reasoning, but in the universe which he reasoned about. He could be subtle and dialectical enough when the occasion required it, as any reader of his latest book, "The Meaning of Truth," can testify. But he had a great dislike of dialectic and logic-chopping. He was a philosopher, not a professor of philosophy. What he cared for deeply and what was strongest in his own nature was the capacity for that direct, immediate intuition into the character of reality, which is the foundation for all dialectic and the criterion of all logical operations. This intuition, this justness of vision was so perfect in him that he could place himself, at a bound, at the very heart of even an opponent's thought, and see it with such a degree of sympathy as to hurt his own cause. He was always trying to save as much of the other man's values as he could. He set himself at the centre and drew all extremes in toward him. One of the many ways in which he indicated the nature of Pragmatism was to call it a mediator.

And a mediator Pragmatism is. It springs directly from that power of sympathetic comprehension and adequacy of intuition which were the whole nature of William James. Among philosophers who have found a place in the history of philosophy, there are hardly any, if we except Spinoza, whose philosophy and life were so absolutely at one. And that is perhaps the secret of the limpid, persuasive English, its arresting freshness, its thought-provoking power, which we have learned to know as the style of William James. In his case, the style was certainly the man, and the man the insight.

This insight is an insight into the basis and value of life. It apprehends experience as a flux and thought as a mediation. It is a mediation between the spirit and its environment, and for James himself had become, as Pragmatism, a mediation between fate and faith, between the march of things

and the impulsion of ideas, between the will of nature and the will of man, between science and religion. There are two forces which impel men to philosophy. One is the inner impulse, the hopes and ideals of which the essence of human nature is woven. If operating without reference to the other, it creates a world in which all the values of our existence are conserved, but which does not describe the world in which mankind must and does seek its livelihood at the hazard of its life. This is the world envisaged in most religions and idealisms. They conserve values, but belie nature; they are optimistic and always have a problem of evil to face. The other force which impels men to philosophy is the shock from without, the massing upon life of the forces of nature which demand to be defined and understood if life is to maintain itself among them. This comprehension and definition is science. It envisages the environment without making it amenable to the ideal. It gets at nature by losing sight of human nature. In the case of idealism aspiration goes off into a limbo of its own without considering its conditions; in the case of naturalism, the flux sweeps on its irrevocable way unmindful of life or its interests. Each of these visions is inwardly coherent, logically consistent; neither is correct. The world is neither purely mechanical nor purely spiritual. It contains clashings of purposes and events, it contains purposes and events that harmonize. Ideals and ideas, William James insists again and again, must not be irrelevant to the conditions of their fulfilment, they are not aliens in a strange world, they have more than a squatter's claim in it. They, too, have a share in making it over and the existence of desire may be one of the conditions of the existence of its satisfaction; the will to believe may be one of the conditions for the coming of its object. Ideas and ideals also are factors in the universal struggle for survival. They, too, have a role to play in the flux, and they become valid and true only as they play that role fitly. But because they play a role, they must not be mistaken, as they are by idealisms and religions, for the sole protagonists in the cosmic drama. That "precipitousness," that certain menace and danger which we find in existence, springs from no ideal or spirit. There is a residual environment where God himself must battle for the good as he knows the good, an environment which is the condition of the good's existence and in which it must be sought. Ideas must be relevant if they are to work; relevancy, appropriateness, fitness, is the condition of all excellence. Reason itself is no more than the sentiment of this relevancy, this adequacy of articulation in the onrush of reality.

From this central vision springs every particular achievement of William James. The "functional viewpoint" in psychology, through which Professor Dewey and others have done so much, and which is to-day the most widespread among psychologists, originates in this vision, for it is from James's treatment of the concept that the "functional viewpoint" derives. And his treatment of the concept itself derives from the radical empiricism which envisages the intimate and interchangeable connections between ideas and

things. This envisagement is still more evident in James's philosophy of religion. If divinity is to be known in its true nature at all, it must be known directly, in an immediate experience, which is only more mystical than the immediate experience of chairs and tables and men and the commoner aspects of nature, in the fact that it is rarer, not in the fact that it is different. The idea of God must be effective in an environment which has God for an object. To know him is to meet him under appropriate conditions face to face; to know him is as much an act of perception as to know any other fellow-being. For God is no more than a fellow-being, a very precious one, a conserver of our values who is engaged with us on our side in the struggle for life against the enmities that surround it, but still a fellow-being only, also enlisted in the great war for the good. And that supremest good, life itself, which discourse represents as the belief in immortality, that also must be sought and justified under appropriate conditions. Those conditions occur wherever the life after death seems to manifest itself, and they must be taken for what they are worth, tested to the limit for the validity, the fitness of the belief in immortality to survive. There is no more than this in William James's attitude toward psychical research. Sensation-mongers have made capital of the wide and just sympathy which ever led James to pursue the truth wherever it seemed to show its face. They have wronged him without reason, and sometimes with malice. Nowhere in his printed utterances on the subject of psychical research can be found anything more than just this readiness to test and examine, to consider and to weigh alternatives, just his righteous indignation at casting aside without a hearing whatever data are offered for the validation of a claim, the satisfaction of an interest, or the realization of an ideal. What moved him in all this was the love of man working through the spirit and with the methods of science. He insisted on giving human aspiration a fair trial.

Giving men and things a fair trial was the whole of William James's life. His sense of justice it was that made him an empiricist and libertarian in metaphysics and a meliorist in ethics. For him change was real, and nothing was so bad that it might not be improved. His own life was an expression of this conviction. For many years under the malignant influence of a grave and baffling disease, he carried out his appointed tasks with unflinching constancy and invincible will. He had, moreover, an extraordinary and infectious joyousness, a sort of youthful buoyancy, which seemed woven into the warp and woof of his philosophic vision as well as into the routine of his daily life. He touched nothing but to illuminate it; a subject in his hands soon began to sparkle and shine, to cast rays in infinite directions on infinite things. He always imparted to his pupils and hearers the feeling of the "something beyond," the "and" which trails after. He gave himself freely to all things; there was not a single humane cause in which he had not a part.

WILLIAM JAMES

Giovanni Papini. "William James." *La Voce* 2 (8 September 1910): 391.

È morto William James.
Non posso piangere ma neppur dimenticare.

Mi fu maestro da lontano parecchi anni e negli ultimi tempi quasi amico – mio *fellow*, come egli diceva. Per quanto m'industri e mi studi, non so ritagliare la sua figura di pensatore dalla storia del mio pensiero e non son capace, almeno in questo momento, di giudicarlo come staccato da me, come pura material di narrazione e di giudizio.

Per un certo verso questo mio vanitoso egocentrismo è giustificato. La personalità del James era gran parte della sua fortuna. Il suo *stile* (non in senso soltanto letterario), il suo particular modo di esporre le cose, di ripresentarle a nuovo, di vivificarle, di farle comprendere in un altro senso, entrava per dimolto nella sua fortuna e nella sua influenza. I filosofi codini l'accusavano di scriver troppo bene, d'essere un letterato, un prezioso, un giacobino, ma non si accorgevano che quello scriver bene, quell'insinuarsi coll'immagine e la terminologia nuova nella mente e nella fantasia dei lettori e degli ascoltatori, faceva parte della sua filosofia, era una conseguenza della sua particolar maniera d'intendere le teorie, cioè non come rigide catapulte invincibili, pronte a scagliare le pesanti verità sulla testa dei ribelli, ma come amiche discrete e affettuose, che parlano all'orecchio nei lunghi crepuscoli d' inverno, e ci consolano il cuore e scoppiettan di spirito come i ceppi tra gli alari, e ci danno una mano, quando sia il caso, a sopportar le fatiche e le angustie della vita – mutevoli, plastiche, duttili, servizievoli e amorose come donne vere.

Fin da quando, nel 1900, io leggevo i primi fascicoli dei *Principi di Psicologia*, su per i rami di un albero, assieme a L. E. Morselli, il James m'è sempre piaciuto per quella sua cordialità intellettuale, per quella profonda facoltà di simpatia che senti in lui anche quando parla di cose esatte e ipotetiche. Si sente nei suoi libri l'uomo che non pensa sempre profondamente ma pensa volentieri, di buon umore, e col sorriso in bocca di chi s'aspetta di far piacere anche agli altri, di aiutarli, di incoraggiarli, di rintonarli, e rinforzarli. Eppoi fa impressione la sua finezza di osservatore che fugge il geometrico e il crudamente illuminato e s'ingegna di riprodurre, come una macchina delicate, la sfumatura e la penombra: non viene in mente a tutti la sua teoria della « frangia della coscienza »?

Fu anche paradossale (bisogna sempre adoprare questa sciocca parola) e piacque anche per quello. La sua teoria delle emozioni – esempio classico di originalità per rovesciamento – fu quella che gli aperse le porte di alcune nazioni, (non si piange perchè siamo addolorati; ma ci sentiamo tristi perchè si piange). E negli ultimi tempi, nei suoi libri sul *Pragmatismo* il paradosso, o la forma paradossale spiritosa e ingegnosa di dir le cose, ogni tanto scappava fuori a risuscitare le lunghe pagine insistenti o leggere. La stessa teoria sua della *will to believe* non ha forse tutta la struttura di un paradosso? (Non si deve creder ciò perchè è vero, – diventerà vero quel che crediamo).

Si capisce che agli occhi dei filosofi seri e ortodossi, che pretendono d'avere fra le mani il codice di procedura del pensiero e scambiano a volte per profondità il moto e per serietà la pedanteria e per sistema la simmetria delle false finestre e per sana tradizione la paura di lasciar le strade maestre, il James è apparso poco meno che un dilettante presuntuoso, degno d'esser colpito dalla scomunica maggiore. Uno spirito eracliteo, che odiava le formule secche e definite come il fumo agli occhi, amante innamorato della volubile corrente del pensiero, preoccupato continuamente delle ragioni morali e sentimentali degli uomini e de' bisogni religiosi della sua razza, non poteva piacere e non doveva pioacere a quelli che cercano la verità e nient'altro che la pura e nuda verità, anche se a volte la trovano morta stecchita nelle fascie degli antichi teoremi o se anche la sperdono correndo dietro a una stregante idea fissa.

Mi ricordo che la prima volta che ho visto il James, a Roma, in un albergo vicino a Porta del Popolo, era in maniche di camicia. Potrei dire, seguendo un po' il suo metodo pittoresco di designare le teorie, che la sua era una filosofia fatta in maniche di camicia, alla buona, senza cerimonie, senza acconciature e apparati. Uno dei suoi libri è sottointitolato « Saggi di filosofia popolare » ma tutti quanti potrebbero esser chiamati cosi. Egli ha svestito la filosofia; l'ha presentata senza la giacchetta dell'ordine paragrafato, senza il soprabito della terminologia tecnica e senza l'alta e nera tuba della profondità. L'ha messa alla portata di tutti, l'ha accostata alla vita quotidiana, l'ha rimessa in relazione coi più elementari interessi dell'esistenza, l'ha fatta apparire generosa, cordiale e alla mano come era lui – non come un'astrologia al servizio di pochi settari ma come cibo e vita delle moltitudini.

A volte facendo della filosofia popolare, semplice chiara e spiritosa, si dicon cose stravecchie o superficiali o false o insignificanti. Ma succede pure che si dicano cose più profonde di quelle dei professori di profondità e cose più nuove dei minatori di novità. Però la limpidezza nasconde a volte come il buio: il veder quelle idée esposte con tanta semplicità e agilità e naturalezza in mezzo ad alter che son notissime o cattive dà l'idea che anche loro sian del medesimo stampo e il lettore non si sofferma e i competenti non le

rilevano. Eppure dal disordine e dall'improvvisazione esce talvolta l'abbondanza e nell'abbondanza sprizzano fuori scintile e fiamme che non sarebbero venute a splendere e a bruciare se tutto fosse andato per le solite strade diritte e coperte di savia cenere.

*

Questa non è una necrologia in regola: me ne accorgo anch'io.

Ma gli italiani studiosi (che in questo caso sono i soli che contano) non hanno proprio bisogno di una bibliografia degli scritti di James. L'Italia, per dir il vero, ha scoperto e amato James più e prima degli altri paesi. La prima traduzione della *Psicologia* è stata quella fatta da G. C. Ferrari e da M. Calderoni e in italiano si trovan tradotti i *Discorsi ai Maestri*, la *Coscienza Religiosa* e, per quanto non ancora pubblicati, i saggi che prendon il titolo dalla *Volontà di credere* e alcuni altri che usciranno fra breve a mia cura.

L'attività filosofica del James si può dividere facilmente in tre momenti: quello primo, psicologico, che ha dato alla scienza due o tre vedute nuove e un bellissimo libro – il secondo, religioso, con la celebre opera che ha risvegliato, anche fra noi, gli studi di psicologia della religione (per quanto prevalentemente documentaria e unliaterale come provenienza d'informazioni) – e il terzo che si può dir metodologico o pragmatistico rivolto a stabilire cosa sia la filosofia e la verità, con tentativi e aspirazioni di una metafisica empiristica.

A proposito: come parlare di James senza paralre di pragmatismo? Da quando, nel 1904, il *Leonardo* cominciò a diffondere e ad elaborare il pragmatismo anglosassone, il nome del James in Italia, e dopo anche fuori, fu congiunto a quello di pragmatismo e il mio nome fu congiunto al suo tanto che ora, anche nei telegrammi dei quotidiani, il mio modesto casato è apparso accanto a quello del morto americano. A me la morte del James, oltre che per utto il resto, è dispiaciuto anche perchè non ho avuto il tempo e l'occasione di spiegarmi con lui a proposito di questo benedetto pragmatismo. Quattro o cinque anni fa io avevo promesso di scrivere un libro sul pragmatismo e ne avevo già scritti diversi capitoli quando il James l'annunziò ai lettori di un suo volume. Ma lavorandoci attorno e cercando di chiarire e di approfondire per me e per gli altri, le mie idee in parte mutarono ed io non scrissi più quel libro. Aspettavo di rivedere il James per spiegarmi con lui e presentargli le mie nuove vedute, contrarie recisamente al suo utilitarismo conoscitivo. Non m'è riuscito: la morte ha impedito la sua nuova venuta in Europa. Volevo precisare le mie idee con lui e per lui contavo sul congresso di Bologna. Molti hanno aspettato quel mio libro sul pragmatismo, molti son curiosi di sapere qual sia la mia presente attitudine rispetto ad esso, cioè in fondo rispetto al James. Qui non ho ormai più tempo e più spazio per spiegarmi liberamente. Dirò soltanto questo: io accetto ancora il pragmatismo cosi detto logico e conoscitivo,

quello del Peirce perfezionato e sistemato in Italia dall'indimenticabile Vailati e dal suo discepolo Mario Calderoni. Però questo pragmatismo della prima maniera nel James appar solo di sfuggita e non sotto forma rigorosa.

Quanto all'altro pragmatismo, a quello che tenta di stabilire un concetto della verità, fondato non sulle conseguenze sensibili o logiche ma sentimentali o utili in senso volgare o materiale, cioè un concetto della verità come qualcosa di servibile e utilizzabile e sottoposto ai bisogni della vita religiosa e morale, io sono assolutamente contrario e credo che lo scopo vero della filosofia sia quel di riconoscere questo carattere utilitario nelle scienze e anche in molte teorie filosofiche passate, ma nello stesso tempo di purgarsi interamente da questo utilitarismo implicito ed esplicito per giungere a una conoscenza pura e disinteressata, sia coll'intuizione, sia col concetto, sia con quel che volete, ma che non sottometta la ricerca della verità veramente vera ai pretesi bisogni dello spirito e alle necessità sociali o alle tradizioni religiose. Verità avanti tutto e sopra tutto – anche se la verità dovesse farci scoprire l' inutilità di sè stessa e dell'universo, e la vanità degli sforzi umani, e la desolazione e il vuoto della vita e l'impossibilità di arrivare a costruzioni che soddisfacciano e contentino la nostra mente e i nostri interessi.

La filosifa, insomma, dev'essere istradamento a una disperazione rassegnata, a una vita eroica, senza speranze di compensi di premi o di consolazioni e perciò dura e fortificante e adatta per uomini veri e non per femminuccie cinguettanti. Il James invece cedette ai bisogni degli uomini, fu indulgente alle aspirazioni de' cuori, s'inchinò dinanzi all'animalesco ultitarismo che dapertutto s'appiatta, anche in quelle che paiono le forme più alte della vita dello spirito, e fu la sua debolezza e la sua colpa. Questa non farà dimenticare la genialità di alcune sue intuizioni e la sua passione quasi religiosa per certi ideali, ma giustificherà il desiderio di una filosofia più indipendente, più eroica e più virile.

WILLIAM JAMES

John Dewey. "William James." *Journal of Philosophy, Psychology and Scientific Methods* 7.19 (15 September 1910): 505–508.

In responding to the request of the editors to write a few words regarding the late William James, I find myself without any of his books at hand. In any case, an adequate estimate of his philosophy could hardly be made at this time. Those who have been associated with him for many years can alone contribute to the story of his intellectual development – a fascinating topic, I imagine. Those who have studied under him will tell the tale of his teaching. While I have been honored with his friendship for many years, circumstances forbade intimacy, and I am not fitted to speak fitting words of his personality. Of William James neither as philosopher nor as man shall I, then, attempt to write, but will attempt some scattered and hurried impressions of what falls between.

The following bare facts, gleaned in part from the public press, are given as matter of record. He was born in New York City, January 11, 1842, being a little more than a year older than his brother, Henry. He must have come naturally by his psychological and metaphysical bent, for the writings of his father are acute and subtle. Many will recall the delightful introduction to some of them with which William James prefaced an edition of the *Literary Remains* of his father. In a daily paper, it is stated that James Russell Lowell called Henry James, Sr., the "best talker in America." The younger James's early education was somewhat scattering, a fact that perhaps had some bearing upon his freely expressed aversion to the over-regimentation of our American college education. Even Harvard he thought too conventional – especially in its unwillingness to make professors of men who would not work well in harness.

His special training was scientific, not literary, being had at the Lawrence Scientific School, upon an Agassiz expedition, and finally at the Harvard Medical School, where he graduated in 1870. Classicists can doubtless explain how it happened that a man of such exquisite literary sense was the product of a scientific training. The student of his works notes both that his psychological career grew naturally out of his physiological interests (he was a teacher of physiology in the Harvard Medical School from 1872 to 1880), and that he was moved to strong reaction against the dogmatic attitude of many scientific men of that time. Chauncey Wright, I suppose, was one of the

profoundest intellectual influences of his life – but in the reverse direction. In 1878 he married Miss Alice Gibbons, who, with four children, survives him. From 1880 till his retirement in 1907 he was on the Harvard staff as teacher of philosophy or psychology, one or both. That his work was recognized in Europe as well as in this country is witnessed in his honorary degrees from Italy, Switzerland, and England, and his membership in the academy of almost every European country. By common consent he was far and away the greatest of American psychologists – it was a case of James first and no second. Were it not for the unreasoned admiration of men and things German, there would be no question, I think, that he was the greatest psychologist of his time in any country – perhaps of any time. The division of philosophy into schools affects the judging of philosophers, but those of the most opposite schools will cordially acknowledge that Mr. James has been one of the few vital and fruitful factors in contemporary thought.

Everyone, I suppose, would cite his sense of reality as Mr. James's foremost trait. I would not say that philosophers as a class are lacking in this trait, but the business of philosophy is to generalize and to systematize; and philosophers are under a greater temptation than others to follow the bent of their own leading principles, to fill in missing considerations and to overlook contrary indications. Mr. James was extraordinarily free from this defect. He saw things in the varied aspects which they have by nature, and was content to report them as he saw them.

The saying, commoner a few years ago than now, but still frequently heard, that Mr. James contradicted himself too much for a philosopher and that he lacked the power of systematic reflection, was in fact a tribute to the sincerity and scope of Mr. James's vision and reporting. As matter of fact, the various portions of Mr. James's "radical empiricism" hang together – in my judgment – in a way indicative of good technical workmanship, but he took things as he found them, and if things were not simple, or consistent, or systematized, his philosophy did not consist in forcing system upon them. In this sense only do I find his thought unsystematic.

In any case, Mr. James has added a precious gift to American philosophic thought. However much or however little it may follow in the path that Mr. James struck out, his influence has made it more hospitable to fact, more sensitive to the complex difficulties of situations, less complacently content with merely schematic unities. One of the defects that troubled Mr. James in the writings of many of the younger philosophers in America, a certain crabbedness and obscurity of style, is, I think, in some degree traceable to this very influence. It is comparatively easy to appear clear when engaged in expounding second-hand ideas or expatiating upon some convention of literary tradition. Groping in unexplored fields after considerations that are themselves obscure lends itself to clear writing only when it coincides with such lucid vision and constructive artistry as Mr. James himself possessed.

This brings me to what I should name as the second of Mr. James's gifts – his power of literary expression. This power strikes both the layman and the professional philosopher, and strikes them at first glance. I shall not be so stupid as to enlarge upon it, and, not being a literary critic, I shall not attempt to describe it. But it is pertinent to remark that in Mr. James's case not only was the style very much of the man, but it was also of the essence of his vision and of his thought. The picturesqueness of reference, the brilliant accuracy of characterization, by which he has enriched philosophic literature, were a part of his sense for the concrete, and for the varied aspects of the world. He was not a philosopher who by taking pains acquired a literary gift; he was an artist who gave philosophic expression to the artist's sense of the unique, and to his love of the individual. It is no accident that the note which sounds through his last systematic work, *A Pluralistic Universe*, is "vision." Akin to the objection that Mr. James was not systematic enough for a philosopher, was the remark that he was more of a literary man than a philosopher – a remark sometimes uttered by those who did not like Mr. James's unprofessional short-cuts to results. The late Dr. W. T. Harris, by temperament and training at the opposite pole of philosophy, did not share this superficial opinion. I recall hearing him say that Mr. James's artistic power was genuine evidence of the depth and reality of his philosophic quality – that only one who had both a direct consciousness of his subject-matter and a sympathetic consciousness of what was stirring, unexpressed, in the minds of other men, could attain Mr. James's artistic distinction.

Even this slight note of appreciation would be incomplete did I not speak of one of the most delightful traits of Mr. James's generous personality – his cordial attitude toward anything that struck him as genuine and individual in the efforts of any other writer, no matter how remote the thought from Mr. James's own. "Philosophy," Mr. James used to say, "is a lonely bug"; and the solitary reflections of many comparatively unknown men in America have been relieved by a word of appreciative encouragement from Mr. James. At times, indeed, Mr. James's discovery of a Spinoza or a Hegel born out of due season, caused some embarrassment to those of us who were less generous. The same largeness of attitude Mr. James carried into discussion and controversy. It would be a nice matter to decide just how much of his reputation for inconsistency was due to his willingness to make concessions to his opponents in the hope of finding common ground beneath, and to his large-minded indifference to minor details of his own former writings.

It would not be fitting to close a notice in a journal read for the most part by professional philosophers without noting Mr. James's religious belief in the possibilities of philosophy. In spite of his not taking philosophic conventionalities at all seriously, he took philosophy itself very seriously. His popular hold is not at all due, I think, simply to his charm of style. His readers instinctively feel that here is a man who believes something and whose belief

is not professional and acquired, but personal and native; a man who believes so deeply in the importance of what he sees and reports that he is not satisfied until his readers also see and have their tone of belief and life modified accordingly. He was, especially in his later writings, an apostle seeking the conversion of souls. Many a note or postal-card of his will be found, I imagine, which refers to the possibility of some discovery, by someone, perhaps to come soon, of a solving word by which light will be made to shine in darkness. When, in one of his recent writings, he refers to the "pragmatistic church," it is not a sectarian and exclusive spirit which animates the phrase, but a fervor of faith in the importance of genuine philosophy. It is a difficult thing for professional philosophers to retain this genuine faith in its simplicity. It gets lost in the mazes of scholarship; wrapped in the napkin of specialization and buried in the ground of professionalism; or it dissipates along with the disillusionizing of early ardent hopes. Our greatest act of piety to him to whom we owe so much is to accept from him some rekindling of a human faith in the human significance of philosophy.

PROFESSOR WILLIAM JAMES

Eric S. Waterhouse. "Professor William James." *London Quarterly Review* 114.2 (October 1910): 317–320.

Not since the death of Lotze has Philosophy borne a greater loss than the death of Prof. William James of Harvard. Today, thirty years after his death, the influence of Lotze is more powerful than at any time during his life. It is only the truly great whom time respects after they have fallen. That such will be the lot of Prof. James may be affirmed without uncertainty. Pragmatism is a philosophical insurrection, and the dust-clouds of the battle-field obscure the personalities in the fight. When the dust is laid and the echoes of the firing are stilled, the historian gives his verdict, and time respects it.

It is frequently to be noticed that the man of genius is the son of the man of ability. The Rev. Henry James, father of William James and his distinguished brother Henry James the novelist, was a strong personality. His religious views, which were influenced largely by Swedenborg, were too independent in construction and expression to allow him to remain within any organized Church. In support of them he issued a series of books, mystical, original, and marked by a vivid style. It is easy to trace in the son the inheritance from the father. During his children's earlier years Mr. Henry James resided in this country, making close acquaintance with Carlyle, but returned subsequently to Boston, which was the family home, although the future professor of psychology had been born in New York on January 11, 1842. At Boston he continued his studies, and finally graduated in medicine at Harvard in 1870. Shortly afterwards he received an appointment on the medical faculty of that university. From this point developed the psychological bent of his mind. It was at the time when psychology was entering upon the new phase of its existence, and from being an art dependent upon unaided introspection, not to say guesswork, was becoming a science; experimental, exact, and comparative. His medical training constituted a natural introduction to the new method, and within a few years he was appointed professor of psychology. In 1890 appeared his *Principles of Psychology*, which received instant recognition as a standard work. Not merely in its erudition, or in its originality, such as, for example, his theory of emotion, but in its arresting presentation of the subject, is the book remarkable. Prof. James made a technical topic as interesting as an essay, and better still wove the interest warp and woof with the subject-matter. It is one thing to enliven

tedium with an occasional permission to the reader to stand at ease: it is another to express a difficult subject so that the reader does not know fatigue. That is the rare art which Prof. James had learned, and never lost in any of his writing.

Psychology led to philosophy and to the philosophical chair at Harvard, which he occupied till his retirement in 1907. In 1902 he published his Gifford lectures, delivered at Edinburgh, under the title *The Varieties of Religious Experience*. The book marks an epoch rather than an episode in religious philosophy. It was the first adequate attempt to estimate religious experience as a psychological, that is to say scientific, fact, and Prof. James succeeded in showing that upon this undeniable ground can be based a philosophy of religion. The major part of the volume is given over to the investigation of typical and extraordinary religious experiences, and the philosophical conclusions are only summarized. He cherished the hope of completing the task, but other work pressed heavily upon a health already failing, and the sequel is left to, and doubtless will be fulfilled by, the many disciples who have been trained to think with him.

Latterly he became the acknowledged leader of the Pragmatist movement, issuing successively *Pragmatism*, *A Pluralistic Universe*, and *The Meaning of Truth*. The conclusions conveyed' in these volumes had long been maturing in his mind. In *The Will to Believe*, issued in 1896, the framework of a Pragmatist philosophy is to be found, though tentative and not definitely named. He has also republished essays written in the early eighties which reveal the same fundamental convictions. It is not possible in a brief note to do justice to Prof. James's stimulating and original views, and I must ask leave to refer the reader to my articles upon *The Religious Philosophy of William James* and *Pragmatism* in the issues of this *Review* of July 1906 and April 1908, and to a general article on *The Present Position in Religious Philosophy* in the last issue. It may, however, be asserted that the root idea of Prof. James's philosophy is that of the freedom of the will. Though regarding it as incapable either of strict scientific proof or disproof, he adopts the idea as ethically imperative. Hence his opposition to Materialism and Absolutism, both of which deny freedom to man, the one in the name of physical science, the other in the name of high thinking. A determined universe was for Prof. James foolishness. It had neither meaning nor purpose; it was a sham-fight, not a struggle, a parade at arms, not a battle. Believing in the real liberty of the will, he necessarily regarded it as a real cause. Hence it follows that the universe is not ready-made, but in the making; a world with real chances, real issues, real successes, real failures. For such a philosophy the time process is not, as Absolute Idealists contend, an illusion, but fundamental reality. The whole duty of man is to cooperate with God in the making of the world upon which the Creator Himself is continuously working.

This will seem sound and wholesome to unphilosophically trained minds, but to those versed in the dogmas of the philosophical schools it is revolutionary, and – if they are Idealists of the usual pattern – probably pernicious. Yet it is difficult to see how the thought of those who adopt the fundamental freedom of the will can travel in any widely different direction. There can be no doubt that the orthodox philosophy of many centuries has been inveterately artificial. For this reason Positivism abandons it to uselessness; Pragmatism, however, redeems it for service. If philosophy is to be more than logic chopping, it must be integrally a part of life, one of the forces that go to the making of life. Can any one say that the ordinary Absolutist and Intellectualist philosophies fulfill this? Belief, for Prof. James, is that which is acted upon, and he resented a philosophy which demands that we should believe in theory what we cannot act upon in practice; believe the time process to be an illusion, and treat it as real; believe man to be determined, and judge him as if he were free. Such a divorce is fatal. Pragmatism is a philosophy that can be brought into real contact with life and religion. The scholastic philosophies dwell in a ghost-world apart. Though not without its besetting dangers, Pragmatism has a future to fulfil and a function to serve greater than its opponents imagine. The strong intellect and charming pen that have framed its earliest outlines are gone, but the personality of Prof. James will live in a philosophy so expressive of it, and his influence will long remain to guide its course and shape its wider destiny.

WILLIAM JAMES

Wilhelm Jerusalem. "William James." *Die Zukunft* 73.6 (5 November 1910): 186–190.

Am achtundzwanzigsten August ist der große amerikanische Psychologe William James in seiner Heimat gestorben. Sein Name ist in den letzten Jahren bei uns besonders viel genannt geworden; am Meisten in Verbindung mit der von James zwar nicht erfundenen, aber sehr energisch vertheidigten neuen philosophischen Methode, die unter dem Namen "Pragmatismus" von Amerika herübergenommen ist. Ich habe selbst zur Bekanntmachung dieser Denkrichtung in Deutschland Einiges beigetragen und mich über Wesen und Werth des Pragmatismus mehrmal ausgesprochen (auch in der "Zukunft" vom zehnten Oktober 1908). Heute aber, wo es gilt, die Summe von James' Lebensarbeit zu ziehen, habe ich den Eindruck, daß man über den Pragmatiker James den Psychologen zu sehr vergißt. James war aber vor Allem einer der besten Kenner und Erforcher des menschlichen Seelenlebens. Hier sind die Wurzeln seiner Kraft. Wenn man James' Bedeutung für die Geistesgeschichte der Menschheit verstehen will, so muß man zunächst den Psychologen ins Auge fassen.

James ist, ähnlich wie Wundt, von der Medizin her zu Psychologie gekommen. Er hat mehrere Jahr hindurch Anatomie und Psychologie vorgetragen und das Leben von seiner physischen Seite her zu erforschen gesucht. Er sah aber ein (und auch hierin hat er Aehnlichkeit mit Wundt), daß die Lebensvorgänge zu erblicken vermag. Wer in die Tiefe dringen und das Leben da erkennen will, wo es nicht nur betrachtet und erforscht, sondern wirklich gelebt wird, Der muß den Standpunkt ändern und von innen heraus den Lebensprozeß da zu erfassen suchen, wo er einzig und allein lebendige Wirklichkeit ist. Das heißt aber nichts Anderes als: Das Leben kann in seiner vollen Eigenart nur von der seelischen Seite her verstanden werden. Das erkannte James und wurde, nachdem er bereits "die Mitte seines Lebensweges" überschritten hatte, zum Psychologen. Damit aber hatte er das Gebiet gefunden, das seiner wissenschaftlichen und menschlichen Eigenart am Meisten entsprach. Amerikanischer Wirtlichkeitsinn, ein kraftvolles Temperament und eine wahre Sehergabe im Schauen und Darstellen seelischer Vorgänge machen James' psychologische Geschriften zu einer eben so reizvollen wie mächtig anregenden und gründlich belehrenden Lecture.

Wer den ganzen James mit all seinem Temperament und mit seinem in die Tiefe dringenden seelischen Blick kennen lernen und auf sich wirken lassen will, Der muß zu seinem grundlegenden ausführlichen Wert, zu den zweibändigen *Principles of Psychology* (erschienen 1890) greifen. Leider ist dieses Werk nicht ins Deutsche übersetzt worden. Nur von dem Auszug, den James einige Jahre später als *"textbook"* veröffentlichte, ist kürzlich eine deutsche Ausgabe erschienen. Aber in diesem *textbook* hat James, wie er im Vorwort selbst sagt, nicht nur alle Citate, sondern auch die ganze Polemik des größeren Werkes weggelassen. Doch gerade in diesen polemischen Bemerkungen liegt oft ein großer Reiz und eine große Kraft. Man lese, zum Beispiel, wie James über Gerbarts Vorstellung-Mechanik oder über Hegels Begriffs-Dialektik urtheilt: und man wird sehen, wie viel positiver Inhalt in dieser temperamentvollen Kritik steckt.

Von den vielen neuen Auffassungen seelischer Vorgänge, die man bei James findet, will ich nur eine hervorheben, die allerdings grundlegend ist. Ich meine James' Lehre vom "Strom des Denkens" oder, wie er es in der kleinen Psychologie ausdrückt, vom "Strom des Bewustseins". Schon Wundt hat den überaus wichtigen Gedanken ausgesprochen, daß alles Psychische uns niemals als ein ruhendes, beharrendes Sein, sondern immer nur als ein in steter Veränderung befindliches Geschehen gegeben ist. Diese Eigenart alles Seelischen ist von maßgebender Bedeutung für die Methode der Psychologie. Man darf hier nie von stabilen Gegenständen, sondern muß immer nur von Vorgängen sprechen. Das Selbe meint auch James mit seinem "Strom des Bewustseins"; aber er meint noch etwas mehr.

Das Seelenleben ist für James nicht nur ein Geschehen, das in der Zeit verläuft, es ist zugleich lebendige, auswählende, von einem Ich ausgehende Thätigkeit, eine Entfaltung von Kräften, die Richtung haben und Richtung geben. In dieser konkreten und aktivistischen Auffassung des Seelenlebens berührt sich James besonders nah mit Henri Bergson, dessen Philosophie er in einem seiner letzten Werke (*A pluralistic Universe* 1909) eben so begeistert wie geistvoll charakterisirt hat. Was Bergson *"la vraie dureeî*, die wahre Dauer nennt, das blos zeitliche, aber dennoch lebendig inhaltvolle seelische Geschehen, das schneeballartig alles Vergangene in vollkommener Durchdringung in sich enthält und als schöpferische Entwickelung immer Neues, Unvorhersehbares hervorbringt, Das ist so ziemlich das Selbe wie James' "Strom des Bewustseins".

Die konkrete und aktivistische Auffassung des Seelenlebens: das ist der Grundzug von James' Psychologie und zugleich die Erklärung für seine religiöse und philosophische Weltanschauung. Das konkrete besteht darin, daß James die Seelischen Vorgänge in ihrer vollen individuellen Bestimmtheit und individuellen Färbung als persönliche Erlebnisse anschaut und darstellt und sich davor hütet, die Auffassungen und Zergliederungen des Psychologen in das seelische Erlebnis selbst hineinzuschmuggeln. James nennt dieses von

den meisten Psychologen unbewußt geübte Gefahren *"The Psychologists fallacy"*, den Trugschluß oder die Fehlerquelle des Psychologen, und sein ganzes Buch ist eine energische Bemühung, diesen Fehler zu vermeiden.

Diese konkrete Auffassung giebt zunächst seinen psychologischen Beschreibungen eine ganz unvergleichliche Lebendigkeit, Klarheit und Realität. Je tiefer sich nun James in diese Betrachtungweise des Seelenlebens versenkte, desto deutlicher ging ihm die Verschiedenheit des Seelischen vom Körperlichen auf, desto weniger konnte er im Glauben an selbständige übernatürliche geistige Mächte etwas Widersprechendes finden. In der Tat bekennt sich denn auch der vom Haus aus religiös veranlagte Mann in seinem religionpsychologischen Werk, in den *"Varietes* (sic) *of religious experience"*, offen zum Supranaturalismus. Aber auch in diesem Werk ist die psychologische Leistung das Wichtigste. James breitet zum Grund von Bekenntnißschriften moderner amerikanischer Sektengründer einen Reichtum des religiösen Erlebens vor uns aus, von dem wohl die wenigsten Leser vorher eine Ahnung hatten. Das Buch bietet also auch Dem, der nicht auf dem philosophischen Standpunkt des Verfassers steht, eine geradezu unerschöpfliche Fundgrube für die Psychologie der Religiosität.

Die aktivistische Auffassung des Seelenlebens besteht darin, daß für James alles seelische Geschehen, das Wahrnehmen, die Erinnerung, die Phantasiethätigkeit und die Gefühle in letzter Linie immer als Werkzeuge des Willens zu deuten und als auf Thätigkeit gerichtet zu denken sind. Besonders klar und zugleich besonders liebenswürdig kommt diese Auffassung in James' Ansprachen an Lehrer, in seinen *"talks to teachers"* (1899) zum Ausdruck. Dieses Buch, dann unter dem Titel "Psychologie und Erziehung" auch deutsch erschienen ist, scheint mir am Besten geeignet, in James' Gedankenwelt einzuführen.

Die konkrete Auffassung des Seelenlebens hat James schließlich zum Pluralismus und die aktivistische zum Pragmatismus geführt. Die Welt ist uns als bunte Vielheit, als unendliche Mannichfaltigkeit gegeben. Die Einheit des Universums ist dem Menschen als Aufgabe gesetzt, darf aber seineswegs als Voraussetzung oder gar als Urthatsache gelten. Die Vereinheitlichung herbeizuführen: dazu braucht er einer Philosophie der That; und diese will der Pragmatismus schaffen. So ist der tiefdringende Psychologe allmählich zum Schöpfer einer lebendigen und Leben fördernden Philosophie geworden.

William James war durch und durch Amerikaner. Bei aller Hochachtung vor der europäischen Wissenschaft war sein Ehrgeiz, nicht nur zu empfangen, sondern auch zu geben. Charakteristisch dafür sind einige einleitende Worte in der ersten seiner Gifford- Vorlesungen, aus denen das erwähnte religionpsychologische Buch besteht. "Für uns Amerikaner", sagt er da,"ist es seine vertraute Erfahrung, von europäischen Gelehrten Belehrung zu empfangen. Uns scheint nur natürlich, daß wir zuhören, wenn Europäer sprechen. Die entgegengesetzte Gewohnheit, selbst zu sprechen, während Europäer zuhören,

haben wir uns noch nicht zu eigen gemacht. Aber wenn der Strom einmal von Westen nach Osten zu fließen begonnen hat, so lassen Sie mich hoffen, daß es auch weiterhin thun wird." In der That hat sein Ruf und seine Persönlichkeit eine solche Anziehungskraft erworben, daß eine nicht geringe Zahl von deutschen Studenten ein oder zwei Semester auf der Harvard University zubrachte, wo James bis vor wenigen Jahren Psychologie vortrug.

Mit deutscher Sprache und deutscher Wissenschaft war James innig vertraut. Nicht selten begegnet man deutschen Wörtern in seinen Schriften und manchmal citiert er eine Stelle aus Goethes Faust oder ein Epigramm von Lessing. Von deutschen Denkern nennt er im Vorwort zur großen Psychologie ausdrücklich Lotze und Wundt, in seinen späteren Arbeiten öfters Wilhelm Ostwald und besonderes Ernst Mach, den er auch einmal in Prag aufsuchte.

Ich selbst habe James leider nie persönlich kennen gelernt, wohl seit zwölf Jahren mit ihm korrespondirt. Eingeleitet wurde diese Korrespondenz durch einen für mich eben so überraschenden wie erfreulichen Brief, in dem James sich ausführlich über mein Buch "Die Urteilsfunktion" aussprach, das ich ihm einige Jahre vorher zugeschickt hatte. Seit dieser Zeit haben wir einander fast alle Publikationen zugeschickt. James' Antworten waren oft nur kurz, denn das Briefeschreiben war, wie er sich einmal mir gegenüber ausdrückte, *"contrary to my psyche"*, aber immer interessant und inhaltvoll. So schrieb er mir vor etwa zehn Jahren, er hoffe, noch *"bevore* (sic) *shuffling off this mortal coil"* seine eigene Philosophie herauszubringen. Nach den Vorlesungen, die er im Frühjahr 1909 in Oxford über das pluralistische Weltbild gehalten hatte, war er durch die vielen Mißverständnisse, denen er begegnete, recht verstimmt und schrieb mir, er habe die Hoffnung aufgegeben, durch Diskussionen anders Denkende zu überzeugen; man müsse den künftigen Generationen überlassen, die Synthese der verschiedenen Denkrichtungen zu vollziehen. Meinen Aufsatz über die Soziologie des Erkennens, der in der "Zukunft" am fünfzehnten Mai 1909 erschien, begrüßte er mit warmem Antheil und regte mich an, das dort angeschlagene Thema weiter zu bearbeiten, worauf er später sogar nochmals zurückkam. Seinen letzten Gruß erhielt ich im Juni dieses Jahres aus Nauheim, wo er von einem Herzleiden Heilung gesucht hat. Die Karte war von ihm und Professor Julius Goldstein aus Darmstadt unterzeichnet, aus dessen Feder wir in nächster Zeit eine Uebersetzung von James' Buch *"A pluralistic Universe"* zu erwarten haben.

Als die Nachricht von seinem Tode kam, mußte ich an das Wort Heraklits denken: "Der Seele Grenzen kannst Du nicht ausfinden, und ob Du jegliche Straße abschrittest; so tiefen Grund hat sie." Auch William James hat die Grenzen der Seele nicht ausgefunden; aber er hat auf dem Wege dazu so manchen neuen Pfad entdeckt und für die kommenden Geschlechter gebahnt.

AN OPEN MIND: WILLIAM JAMES

Walter Lippman. "An Open Mind: William James." *Everybody's Magazine* 23.12 (December 1910): 800–801.

Within a week of the death of Professor William James of Harvard University, the newspapers had it that Mr. M. S. Ayer of Boston had received a message from his spirit. This news item provoked the ridicule of the people who don't believe in ghosts, but the joke was on Mr. Ayer of Boston. When, however, it was reported that Professor James himself had agreed to communicate with this world, if he could, and, in order to test the reports, had left a sealed message to be opened at a certain definite time after his death, the incredulous gasped at the professor's amazing "credulity."

William James wasn't "credulous." He was simply open-minded. Maybe the soul of man *is* immortal. The professors couldn't prove it wasn't, so James was willing to open his mind to evidence. He was willing to hunt for evidence, and to be convinced by it.

And in that he was simply keeping America's promise: he was actually doing what we, as a nation, proclaimed that we would do. He was tolerant; he was willing to listen to what seems preposterous, and to consider what might, though queer, be true. And he showed that this democratic attitude of mind is every bit as fruitful as the aristocratic determination to ignore new and strange-looking ideas. James was a democrat. He gave all men and all creeds, any idea, any theory, any superstition, a respectful hearing.

His interest in spiritualism is merely one illustration in a thousand. The hard scientists knew it was a hoax because they couldn't explain it, and the sentimentalists knew it was the truth because they wished it to be: but James wanted to know the facts. So he went to Mrs. Piper, and heard her out. Nay, he listened to Palladino and to Münsterberg. They pretended to know, and maybe they did.

And last year, when Frank Harris published his book on Shakespeare, to show that the "unknown" life and character of the poet could be drawn from his works, the other professors laughed the theory out of court. James went to Shakespeare and read the plays all over again to test the Harris theory. Maybe the poet *could* be known by his works. The fact that the theory was revolutionary did not alter the possibility that it might be true.

So with religion. A scientist, living in an age when science is dogmatically irreligious, he turned from its cocksure reasoning to ask for the facts. He went

to the lives of the saints! Not to Herbert Spencer, you see. When he wanted to study the religious experience he went to the people who had had it, to Santa Theresa and Mrs. Eddy. They might know something the professors didn't know.

And again: at the age of sixty-five, with the whole of New England's individualism behind him, he asked about socialism. When he met H. G. Wells, he listened to the socialist, and, as it happens, was converted. So he said so. James was no more afraid of a new political theory than he was of ghosts, and he was no more afraid of proclaiming a new theory, or an old one, than he was of being a ghost. I think he would have listened with an open mind to the devil's account of heaven, and I'm sure he would have heard him out on hell.

James knew that he didn't know. He never acted upon the notion that the truth was his store of wisdom. Perhaps that is why he kept on rummaging about in other people's stores, and commending their goods. He seemed to take a delight in writing introductions, and appreciations of new books, and in going out of his way to listen to a young doctor of philosophy, or an undergraduate discussion of pragmatism, or the poetry of an obscure mystic. And, optimist that he was, by virtue of his unceasing freshness of interest, there is nothing more open-minded in our literature than his chivalrous respect for the pessimism of Francis Thompson.

> "Speak not of comfort where no comfort is,
> Speak not at all: can words make foul
> things fair?
> Our life's a cheat, our death a black abyss:
> Hush and be mute, envisaging despair."

He felt with all sorts of men. He understood their demand for immediate answers to the great speculative questions of life. God, freedom, immortality, nature as moral or non-moral – these were for him not matters of idle scientific wonder, but of urgent need. The scientific demand that men should wait "till doomsday, or till such time as our senses and intellect working together may have raked in evidence enough" for answers to these questions, is, says James, "the queerest idol ever manufactured in the philosophic cave." We cannot wait for a final solution. Our daily life is full of choices that we cannot dodge, and some guide we simply must have. There can be no loitering at the crossroads. We are busy. We must choose, whether we will it or not, and where all is doubt, who shall refuse us the right to believe what seems most adapted to our needs? Not know, you understand, but believe.

That is the famous position taken in "The Will to Believe." As James has since pointed out, its real title should have been "The Right to Believe." No doctrine in James's thinking has been more persistently misunderstood. Yet it rests on the simplest of insights: that atheism and theism are both dogmas, for there is

scientific evidence for neither; that to withhold judgment is really to make a judgment, and act as if God didn't exist; that until the evidence is complete men have a right to believe what they most need.

James has acted upon that right. He has made a picture compounded of the insights of feeling, the elaborations of reason, and the daily requirements of men. It is a huge guess, if you like, to be verified only at the end of the world. But it has made many men at home in the universe. And this democrat understood the need of feeling at home in the world, and he understood also that the aristocrats are not at home here. (Perhaps that's why they are aristocrats.) "The luxurious classes," he says, "are blind to man's real relation to the globe he lives on, and to the permanently hard and solid foundations of his higher life." And he prescribed for them – for their culture, I mean – this treatment: "To coal and iron mines, to freight trains, to fishing fleets in December, to dishwashing, clotheswashing and windowwashing, to road-building and tunnel-making, to foundries and stoke-holes, and to the frames of skyscrapers, would our gilded youths be drafted off according to their choice, to get the childishness knocked out of them, and to come back into society with healthier sympathies and soberer ideas."

This, and thoughts like this, and kindnesses like this, put James not alone among the democrats of this uncertain world, but among the poets also; among the poetic philosophers who, like Goethe, Schopenhauer, and Whitman, have a sense of the pace of things. Sunlight and storm-cloud, the subdued busyness of outdoors, the rumble of cities, the mud of life's beginning and the heaven of its hopes, stain his pages with the glad, sweaty sense of life itself.

It is an encouraging thought that America should have produced perhaps the most tolerant man of our generation. It is a stimulating thought that he was a man whose tolerance never meant the kind of timidity which refuses to take a stand "because there is so much to be said on both sides." As every one knows, he fought hard for his ideas, because he believed in them, and because he wanted others to believe in them. The propagandist was strong in William James. He wished to give as well as receive. And he listened for truth from anybody, and from anywhere, and in any form. He listened for it from Emma Goldman, the pope, or a sophomore; preached from a pulpit, a throne, or a soap-box; in the language of science, in slang, in fin rhetoric, or in the talk of a ward boss.

And he told his conclusions. He told them, too, without the expert's arrogance toward the man in the street, and without the dainty and finicky horror of being popular and journalistic. He would quote Mr. Dooley on God to make himself understood among men. He would have heard God gladly in the overalls of a carpenter, even though He came to preach that the soul of man is immortal. So openminded was he; so very much of a democrat.

WILLIAM JAMES

James R. Angell. "William James." *Psychological Review* 18.1 (January 1911): 78–82.

No one who knew William James can ever write of him in a wholly objective and dispassionate spirit. Nor can one cherish any hope of transfusing into words the abundant richness of his wonderful nature. Any just estimate of the man would require for its accomplishment a soul as pure and fine and brave as his own. The final valuation of his work must be confided to another generation. These lines are devoted to a few brief reminiscences, and particularly to such as may remind us of the profound changes in our psychological thought and practice for which we are primarily indebted to him.

To be sure at the time of his death, James was generally regarded as a philosopher rather than as a psychologist. And a philosopher he was in the best sense of the word, a devoted and courageous seeker after the deepest truths of life. But he was also a psychologist, easily first among his countrymen, and to emphasize this fact is the peculiar privilege of this *Review*, with the first number of which his name was associated as an editor.

We may begin our reminiscences with the publication of *The Principles of Psychology* in 1890. Prior to that James had been writing occasional brilliant articles and essays, some of which appeared later in modified form as chapters in the book, still others coming to life again in the volume entitled *The Will to Believe*. But until the appearance of *The Principles* his influence was on the whole secondary and local. With the publication of this great work, which the writer believes to be altogether his most valuable and lasting monument (it has in it most distinctly the seeds of all his later philosophical development) a profound and radical change came over the scene.

Who does not remember the sense of glowing delight with which we first read the pages of the big, cumbrous, ill-bound and rather ill-printed volumes? It was like inhaling a rare, pungent mountain air, vital, bracing and almost intoxicating. To many of us of the younger generation the book was assigned as a text. We read it as one reads the most fascinating tale of a master – spell-bound and transported and yet withal feeling ourselves acquiring new powers, and gaining command of pregnant thoughts. Scores of other readers fared as did we and so it came to pass that almost over night James became the recognized fountain head of the most original and most vigorous psycho-

logical thinking in our country. To get the perspective one must recall the conditions of our literature at that time.

In 1887 Ladd published his treatise on *Physiological Psychology* and Dewey his text-book on *General Psychology*. Two years later came Baldwin's *Senses and Intellect*. Signs were therefore not wanting of an intellectual ferment at work. But Ladd's volume was too technical to attract general attention, and the other two books, although favorably received, suffered under the suspicion of being philosophy rather than pure psychology, added to which both were addressed to the needs of college students and followed rather rigid lines of exposition. Prior to the appearance of these works, American students had been nurtured almost exclusively on Porter, McCosh, Hickok, Wayland, Haven, Hopkins, and their various followers. Not that all these authors deserve in any sense to be classed together, but simply that they represented in various degrees scientifically archaic and outworn methods in psychology, which were nevertheless still current in our colleges. At such a critical period appeared the epoch-making *Principles*.

It is difficult to appreciate how much that is now familiar and commonplace in psychological writing was introduced by James. But the simplest process of comparing the authors last mentioned with the writings of to-day abundantly exhibits the transition which has occurred and for which James more than any other one man is directly responsible.

Perhaps the most fundamental of all the doctrines he introduced and popularized was the physiological conception of habit as the basal principle of mental organization. He not only made this pivotal in his account of the associative processes of the intellect, but he exhibited it as the central feature in the development of the will. When a decade later he published his *Talks to Teachers*, he took it up again and made it cardinal for educational practice.

If the principle of habit may in certain ways be regarded as the most important interpretative principle running through his work and the one which enlisted the widest and most immediate interest – and general assent – it must in other ways share the honor with its complementary principle, the cerebralistic hypothesis of the conditions of thought.

This hypothesis is of course in no sense an invention of William James. Indeed, in many ways it simply formulates facts well known to the veriest way-farer. But no previous English writer on psychology since Hartley's day had espoused this view so explicitly and at the same time made such constant practical use of it. James turns to it at every point for the explanation of mental phenomena, a practice which caused him to be branded by the orthodox as a dangerous materialist.

He shared with Lange the honor of revolutionizing the current view of emotion. The exposition of his theory rescued the subject at a stroke from the

dull routine of purely descriptive psychology and, notwithstanding a constant fire of acute criticism, his position has substantially held its own up to the present day.

Following closely in the footsteps of Darwin, he made instinct an essential part of the study of the human mind in a way no other psychologist had done. He took a large, flexible, dynamic view of instinct which gave it a place in the very forefront of human life and so of human psychology, instead of relegating it to the limbo of 'left-overs' from our animal ancestry for which apologies must be made and moralizing indulged.

He wrote perhaps the only thoroughly entertaining account of reasoning that we have in the English language and yet managed to make clear much of what is technically most essential to know, if one would understand the actual workings of the mind. Despite their admirable analytic fidelity to detail, one has only to compare with James' chapter on 'Reasoning' in the *Principles*, certain of the contemporary German analyses of the process, to feel that he is in reality closer to the pith of the matter than they.

His account of space perception established the subject on a level which it had never before reached in modern English writings and thereby rendered a service of lasting value. It still remains, twenty years after it was written, one of the most valuable of store-houses for all the fundamental phases of the subject.

James made a conscious and systematic struggle for the recognition of the vague, the fugitive, the transitory, in consciousness, as over against the 'block-house' scheme of mental organization. This tendency appeared most clearly perhaps in his celebrated chapter on the Stream of Consciousness, and more especially in his doctrine of 'Feelings of Relation' in which we have the first adequate insistence in contemporary writing on this aspect of consciousness.

His conception of the self as a hierarchy made a deep impression, not so much perhaps for its intrinsic novelty, as by reason of the peculiar picturesqueness and force of his description and his pungent sallies at the expense of popular complacencies.

He made much wider use than had any previous English-speaking psychologist of materials drawn from the pathological side of mental life. This was in part no doubt a reflex of his medical training, in part was due to his intrinsic interest in the unusual. This trait appears very strikingly in the selection of material for his great work on religious experience.

No one thing so radically divided professional opinion of James as his support of the Psychical Research Movement. In England the society began its career under auspices in many respects most favorable and in all respects scientifically respectable, not to say, eminent. But in this country, James for years stood almost alone among men of high intellectual repute, and although he was eminently conservative in his estimate of the results of the work of the society, he nevertheless committed himself to belief in certain mediumistic

phenomena in a way which seriously offended many of his professional colleagues. At best, they regarded him as a man whose judgment could not be trusted, at worst as an unwitting backer of quackery and fraud.

His position on the issue was all of a piece with his insistent and never failing protestantism, his passion for fair play, and a just hearing for all sides of every question. He was never afraid to make a mistake if only it were honest, and he started off on a new tack when he found himself in error, as though fallacy were a regular part of the day's work. He had a wholesome contempt, which I have heard him more than once express with characteristic vigor, for the pose of infallibility and essential omniscience assumed by certain distinguished scholars. It seemed to him at once petty and contemptible.

Whether or not we agree with his view of psychic research, it will be a thousand pities if James' attitude in the matter should fail to teach us of the younger generation the high rewards of honest independence and the insidious dangers of moral stultification which lurk in a lethargic or a cowardly intellectual conformity to ruling creed, whether of church or of science.

In this matter, as in the others to which we have referred, we may gratefully look for his most enduring contributions not so much in the specific doctrines which he taught and defended, as in his splendid spirit of eagerness for the truth, his open-minded willingness to find this truth in humble and out of the way places, and his dauntless courage in proclaiming his faith in whatsoever he found worthy.

With few men could an inventory of his accomplishments, however impressive, be so entirely and grotesquely inadequate as with James. It has been a favorite comment upon his writing that in his case the 'style is the man' in an extraordinary measure. And the saying is true, but what it leaves unsaid is more than what it utters. His personality was fascinating and magnetic to a degree which his writings hardly indicate. This was perhaps in part due to the wonderful play of light in his eyes, in part to the singularly sweet and resonant tones of his voice, to say nothing of the racy picturesqueness of his words. But inwardly no doubt it sprang from the unsounded wells of sympathy in his nature which made every human creature a thing of at least passing interest to him.

As a teacher he was especially sympathetic and stimulating. He overestimated the capacities of many of his students most seriously, or at least, appeared to do so, but this only put them on their mettle to make good his estimate. What he did in this way to encourage his own pupils, he did more widely for struggling talent wherever he chanced to note it. No brochure so obscure, no writer so unknown, but that if James detected any spark of promise, he sent a word of appreciation. How much such encouragement meant to many a young scholar toiling for recognition, no one will ever know. But the sum must be large beyond belief.

William James was that rarest of human beings – a great man who was also simple, kindly, brave and true. His memory will always be with us as an inspiration and a benediction.

WILLIAM JAMES: LIFE AND PERSONALITY

Émile Boutroux. "William James: Life and Personality." *William James*, trans. Archibald Henderson and Barbara Henderson (London: Longmans, Green, and Co., 1912), pp. 10–18.

The life of Professor James was entirely devoted to studying, experimenting, observing, reading, reflecting, investigating, instructing, talking and writing. He knew a great deal, thanks to his lively intellectual curiosity, his powerful and precise memory, his knowledge of languages, his love of books, and his innumerable associations in every country. But he appreciated only the judgments immediately drawn from observation of realities and constantly controlled by this same observation. He regarded as negligible any formula which could not be translated into a fact of experience. One word was constantly upon his lips, expressing that mode of thought which he especially prized: the word *direct*. He rather enjoyed hurling facts, brutal experience, life, common sense, those ordinary, common and familiar things so dear to Pascal, into the midst of the scholarly systems, the lofty phrases, the sacrosanct traditions of the scholastic, ancient and modern.

Among those students who flocked to his lectures, many came chiefly to obtain ready-made answers in view of their examinations; but he took no pains to satisfy them. With all the fine freshness of his vivacity and verve, he gave his audience the result of his researches and of his personal reflections upon the problems which absorbed him, without so much as recalling the existence of an academic programme. To illustrate, one of his hearers one day interrupted him with these words: "To be serious, for a moment."

This very clever and eloquent professor "professed" as little as possible. He was incapable of binding himself by the rules of official pedagogy. He threw into his speech his ceaselessly active thought, his ardent soul, his whole being. Whether he taught in his own class room or lectured outside, whether he conversed familiarly with his friends, the spontaneity of his discourse was always arresting. Everything he said was full of pith and suggestion, and he never expressed himself in a conventional, abstract and impersonal way. His ideas left his brain thoroughly alive and impregnated with his personality; the most unexpected, ingenious, and amusing expressions fell naturally from his lips and fixed themselves in the minds of his hearers, who were at once surprised, charmed, and inspired to think for themselves. There was never a more perfect illustration of the too frequently

quoted saying of Pascal: "We are delighted when we expect to see an author and find a man."

He wrote just as he talked. Was there, in his case, any great difference between the two occupations? In reading his works, we seem to hear him speak. In the arrangement of his ideas, there is that same subtle order, free and lively – Pascal's "the order of the heart" – more profound and possibly truer than the gross and palpable order of geometric demonstration. There is the same picturesque, personal language, full of ingenuities and suggestive images. There is the same vivacity, the same vigour of attack and of argument. There is also a superior elegance, marvellous mixture of knowledge, precision, nicety, force, naturalness, grace, and a sort of abandon. Consequently, this profound and trustworthy thinker is, without exerting himself to that end, an author, an artist, one of the glories of American literature as well as of its philosophy. And among other merits, his works possess this rare attribute: they are read.

The life bodied forth so directly by this learning and these works is, in its extreme simplicity, one of incomparable moral richness.

While certain thinkers devote themselves to transforming immediate realities, along with the passions, the conflicts and the gropings which they involve, into pure ideas, abstract, rigid and impassable, and to observing in some fashion changing things in the guise of changeless eternity, for William James ideas, as such, possess meaning and value in direct proportion to the measure of life that they retain; and every activity of his mind is a cordial participation in the emotions, the labours, and the present tasks of his country and of humanity. He does not merely give expression, as an exceptionally well informed man and subtle critic, to his views upon the conditions of his great philosophic problems, such as the methods and the significance of science, the relations between science and religion, education, the value of suffering, conflict and war, the ideal form of human life. In his own mind he sees himself actually facing alternatives evoked by these questions, and he deals with and resolves these questions with all the force of his being, as everyone does when he feels that a question concerns himself, and not merely other people. Hence the personal and sympathetic note of his words. He moved the souls of his questioners, because he spoke from his own soul.

Moreover he brought to the study of the problems of life exceptional virility and loftiness of view. He had a proud and courageous soul; and this pride was founded upon a simple trust in the injunctions of morality and the generous enthusiasms of religion. He had the instinct for sympathy and love, for sacrifice, for the asceticism which disciplines the will, for the heroism consecrated to the ideal. He had little taste for protestations of zeal and devotion, and would doubtless have preferred rude frankness to amiable complacency. He would rather have ventured to recall Alceste than

Philinte. But if he gave freely of himself only to the truly "scious,"[1] he showed an infinitely affectionate, attentive and delicate kindness toward those whom he counted his friends. In that charming residence in Irving Street, which he himself had planned, a large and simple wooden house in the colonial style, surrounded by lawn and trees, like the greater number of the dwelling places in Cambridge, the prevailing atmosphere of the James family was one of very cordial hospitality, as well as of intelligence, wit, frankness, intimacy, outspokenness, work, zest, and earnest.

Such were the conditions in his own family last spring (1910) when Professor James, who in his capacity of physician had followed the course of his malady, decided as a last resort on visiting Paris to consult a distinguished specialist. Neither then nor later, during the period when his sufferings were redoubled and the future grew darker from day to day, did his original humour, his spiritual vivacity, his interest in the present, his inexhaustible courtesy, ever fail him. He doubtless believed that the mind was stronger than the agents which destroy the organism. And he believed that, to men of good will, death itself could not be otherwise than good. The most excruciating suffering, the impatient call of death, wrung from him no complaint, no word or sign of discouragement. To the end he was the man of thought, of faith and of energy, not admitting that our brief wisdom sets any bounds to possibility, and believing that it depends upon us to contribute, by our personal effort, here below and perhaps hereafter, to the conservation and development of the moral and spiritual forces of the universe.

Section Three

Evaluations of James's Pragmatism, 1910–1940

WILLIAM JAMES'S CONCEPTION OF TRUTH

Bertrand Russell. "William James's Conception of Truth." *Philosophical Essays* (London and New York: Longmans, Green, and Co., 1910), chap. 5, pp. 127–149.

Pragmatism: A New Name For Some Old Ways of Thinking. Popular Lectures on Philosophy, by William James (Longmans, Green, and Co., 1907). The following article is reprinted from the Albany Review, January, 1908, where it appeared under the title "Transatlantic 'Truth'." It has been criticized by William James in *The Meaning of Truth* (Longmans, 1909), in the article called "Two English Critics."

"The history of philosophy," as William James observes, "is to a great extent that of a certain clash of human temperaments." In dealing with a temperament of such charm as his, it is not pleasant to think of a "clash"; one does not willingly differ, or meet so much urbanity by churlish criticisms. Fortunately, a very large part of his book is concerned with the advocacy of positions which pragmatism shares with other forms of empiricism; with all this part of his book, I, as an empiricist, find myself, broadly speaking, in agreement. I might instance the lecture devoted to a problem which he considers "the most central of all philosophic problems," namely, that of the One and the Many. In this lecture he declares himself on the whole a pluralist, after a discussion of the kinds and degrees of unity to be found in the world to which any empiricist may wholly assent. Throughout the book, the distinctive tenets of pragmatism only make their appearance now and again, after the ground has been carefully prepared. James speaks somewhere of Dr. Schiller's "butt-end foremost statement of the humanist position." His own statement is the very reverse of "butt-end foremost"; it is insinuating, gradual, imperceptible.

A good illustration of his insinuating method is afforded by his lecture on common sense. The categories of common sense, as he points out, and as we may all agree, embody discoveries of our remote ancestors; but these discoveries cannot be regarded as final, because science, and still more philosophy, finds common-sense notions inadequate in many ways. Common sense, science, and philosophy, we are told, are all insufficiently true in some respect; and to this again we may agree. But he adds: "It is evident that the conflict of these so widely differing systems obliges us to overhaul the very idea of

truth, for at present we have no definite notion of what the word may mean" (p. 192). Here, as I think, we have a mere *non sequitur*. A damson-tart, a plum-tart, and a gooseberrytart may all be insufficiently sweet; but does that oblige us to overhaul the very notion of sweetness, or show that we have no definite notion of what the word 'sweetness' may mean? It seems to me, on the contrary, that if we perceive that they are insufficiently sweet, that shows that we do know what 'sweetness' is; and the same surely applies to truth. But this remark is merely by the way.

James, like most philosophers, represents his views as mediating between two opposing schools. He begins by distinguishing two philosophic types called respectively the 'tender-minded' and the 'tough-minded'. The 'tender-minded' are "rationalistic, intellectualistic, idealistic, optimistic, religious, free-willist, monistic, dogmatical." The 'tough-minded' are "empiricist, sensationalistic, materialistic, pessimistic, irreligious, fatalistic, pluralistic, sceptical." Traditionally, German philosophy was on the whole 'tender-minded', British philosophy was on the whole 'tough-minded'. It will clear the ground for me to confess at once that I belong, with some reserves, to the 'tough-minded' type. Pragmatism, William James avers, "can satisfy both kinds of demand. It can remain religious like the rationalisms, but at the same time, like the empiricisms, it can preserve the richest intimacy with facts." This reconciliation, to my mind, is illusory; I find myself agreeing with the 'tough-minded' half of pragmatism and totally disagreeing with the 'tender-minded' half. But the disentangling of the two halves must be postponed till we have seen how the reconciliation professes to be effected. Pragmatism represents, on the one hand, a method and habit of mind, on the other, a certain theory as to what constitutes truth. The latter is more nearly what Dr. Schiller calls humanism; but this name is not adopted by James. We must, therefore, distinguish the pragmatic *method* and the pragmatic *theory of truth*. The former, up to a point, is involved in all induction, and is certainly largely commendable. The latter is the essential novelty and the point of real importance. But let us first consider the pragmatic method.

"Pragmatism," says James, "represents a perfectly familiar attitude in philosophy, the empiricist attitude, but it represents it, as it seems to me, both in a more radical and in a less objectionable form than it has ever yet assumed. A pragmatist turns his back resolutely and once for all upon a lot of inveterate habits dear to professional philosophers. He turns away from abstraction and insufficiency, from verbal solutions, from bad *a priori* reasons, from fixed principles, closed systems, and pretended absolutes and origins. He turns towards concreteness and adequacy towards facts, towards action and towards power. That means the empiricist temper regnant and the rationalist temper sincerely given up. It means the open air and possibilities of nature, as against dogma, artificiality, and the pretence of finality in truth" (p. 51).

The temper of mind here described is one with which I, for my part, in the main cordially sympathize. But I think there is an impression in the mind of William James, as of some other pragmatists, that pragmatism involves a more open mind than its opposite. As regards scientific questions, or even the less important questions of philosophy, this is no doubt more or less the case. But as regards the fundamental questions of philosophy – especially as regards what I consider *the* fundamental question, namely, the nature of truth – pragmatism is absolutely dogmatic. The hypothesis that pragmatism is erroneous is not allowed to enter for the pragmatic competition; however well it may work, it is not to be entertained. To "turn your back resolutely and once for all" upon the philosophy of others may be heroic or praiseworthy, but it is not undogmatic or open-minded. A modest shrinking from self-assertion, a sense that all our theories are provisional, a constant realization that after all the hypothesis of our opponents may be the right one – these characterize the truly empirical temper, but I do not observe that they invariably characterize the writings of pragmatists. Dogmatism in fundamentals is more or less unavoidable in philosophy, and I do not blame pragmatists for what could not be otherwise; but I demur to their claim to a greater open-mindedness than is or may be possessed by their critics.

William James, however, it must be admitted, is about as little pontifical as a philosopher well can be. And his complete absence of unction is most refreshing. "In this real world of sweat and dirt," he says, "it seems to me that when a view of things is 'noble', that ought to count as a presumption against its truth and as a philosophic disqualification" (p. 72). Accordingly his contentions are never supported by 'fine writing'; he brings them into the market-place, and is not afraid to be homely, untechnical, and slangy. All this makes his books refreshing to read, and shows that they contain what he really lives by, not merely what he holds in his professional capacity.

But it is time to return to the pragmatic method.

"The pragmatic method," we are told, "is primarily a method of settling metaphysical disputes that otherwise might be interminable. Is the world one or many? – fated or free? – material or spiritual? Here are notions either of which may or may not hold good of the world; and disputes over such notions are unending. The pragmatic method in such cases is to try to interpret each notion by tracing its respective practical consequences. What difference would it practically make to anyone if this notion rather than that notion were true? If no practical difference whatever can be traced, then the alternatives mean practically the same thing, and all dispute is idle. Whenever a dispute is serious, we ought to be able to show some practical difference that must follow from one side or the other's being right." And again: "To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve – what sensations we are to expect from it, and what reactions we must prepare. Our

conception of these effects, whether immediate or remote, is then for us the whole of our conception of the object, so far as that conception has positive significance at all" (pp. 45–7).

To this method, applied within limits and to suitable topics, there is no ground for objecting. On the contrary, it is wholesome to keep in touch with concrete facts, as far as possible, by remembering to bring our theories constantly into connection with them. The method, however, involves more than is stated in the extract which I quoted just now. It involves also the suggestion of the pragmatic criterion of truth: a belief is to be judged true in so far as the practical consequences of its adoption are good. Some pragmatists, for example, Le Roy (who has lately suffered Papal condemnation), regard the pragmatic test as giving *only* a criterion;[1] others, notably Dr. Schiller, regard it as giving the actual *meaning* of truth. William James agrees on this point with Dr. Schiller, though, like him, he does not enter into the question of criterion *versus* meaning.

The pragmatic theory of truth is the central doctrine of pragmatism, and we must consider it at some length. William James states it in various ways, some of which I shall now quote. He says: "Ideas (which themselves are but parts of our experience) become true just in so far as they help us to get into satisfactory relation with other parts of our experience" (p. 58). Again: "Truth is *one species of good*, and not, as is usually supposed, a category distinct from good, and coordinate with it. *The true is the name of whatever proves itself to be good in the way of belief, and good, too, for definite, assignable reasons*" (p. 75). That truth means "agreement with reality" may be said by a pragmatist as well as by anyone else, but the pragmatist differs from others as to what is meant by *agreement*, and also (it would seem) as to what is meant by *reality*. William James gives the following definition of agreement: "To 'agree' in the widest sense with a reality *can only mean to be guided either straight up to it or into its surroundings, or to be put into such working touch with it as to handle either it or something connected with it better than if we disagreed*" (p. 212). This language is rather metaphorical, and a little puzzling; it is plain, however, that 'agreement' is regarded as practical, not as merely intellectual. This emphasis on practice is, of course, one of the leading features of pragmatism.

In order to understand the pragmatic notion of truth, we have to be clear as to the basis of *fact* upon which truths are supposed to rest. Immediate sensible experience, for example, does not come under the alternative of *true* and *false*. "Day follows day," says James, "and its contents are simply added. The new contents themselves are not true, they simply *come* and *are*. Truth

[1] Cf., e.g., Le Roy, "Comment se pose le problème de Dieu," *Revue de Métaphysique et de Morale* xv 4 (July 1907), pp. 506, 507 *n.*

is *what we say about* them" (p. 62). Thus when we are merely aware of sensible objects, we are not to be regarded as knowing any truth, although we have a certain kind of contact with reality. It is important to realize that the *facts* which thus lie outside the scope of truth and falsehood supply the material which is presupposed by the pragmatic theory. Our beliefs have to agree with matters of fact: it is an essential part of their 'satisfactoriness' that they should do so. James also mentions what he calls "relations among purely mental ideas" as part of our stock-in-trade with which pragmatism starts. He mentions as instances "1 and 1 make 2," "white differs less from grey than it does from black," and so on. All such propositions as these, then, we are supposed to know for certain before we can get under way. As James puts it: "Between the coercions of the sensible order and those of the ideal order, our mind is thus wedged tightly. Our ideas must agree with realities, be such realities concrete or abstract, be they facts or be they principles, under penalty of endless inconsistency and frustration" (p. 211). Thus it is only when we pass beyond plain matters of fact and *a priori* truisms that the pragmatic notion of truth comes in. It is, in short, the notion to be applied to doubtful cases, but it is not the notion to be applied to cases about which there can be no doubt. And that there are cases about which there can be no doubt is presupposed in the very statement of the pragmatist position. "Our account of truth," James tells us, "is an account ... of processes of leading, realized *in rebus*, and having only this quality in common, that they *pay*" (p. 218). We may thus sum up the philosophy in the following definition: "A truth is anything which it pays to believe." Now, if this definition is to be useful, as pragmatism intends it to be, it must be possible to know that it pays to believe something without knowing anything that pragmatism would call a truth. Hence the knowledge that a certain belief pays must be classed as knowledge of a sensible fact or of a "relation among purely mental ideas," or as some compound of the two, and must be so easy to discover as not to be worthy of having the pragmatic test applied to it. There is, however, some difficulty in this view. Let us consider for a moment what it means to say that a belief 'pays'. We must suppose that this means that the consequences of entertaining the belief are better than those of rejecting it. In order to know this, we must know what are the consequences of entertaining it, and what are the consequences of rejecting it; we must know also what consequences are good, what bad, what consequences are better, and what worse. Take, say, belief in the Roman Catholic Faith. This, we may agree, causes a certain amount of happiness at the expense of a certain amount of stupidity and priestly domination. Such a view is disputable and disputed, but we will let that pass. But then comes the question whether, admitting the effects to be such, they are to be classed as on the whole good or on the whole bad; and this question is one which is so difficult that our test of truth becomes practically useless. It is far easier, it seems to me, to settle the plain question of fact: "Have Popes

been always infallible?" than to settle the question whether the effects of thinking them infallible are on the whole good. Yet this question, of the truth of Roman Catholicism, is just the sort of question that pragmatists consider specially suitable to their method.

The notion that it is quite easy to know when the consequences of a belief are good, so easy, in fact, that a theory of knowledge need take no account of anything so simple – this notion, I must say, seems to me one of the strangest assumptions for a theory of knowledge to make. Let us take another illustration. Many of the men of the French Revolution were disciples of Rousseau, and their belief in his doctrines had far-reaching effects, which make Europe at this day a different place from what it would have been without that belief. If, on the whole, the effects of their belief have been good, we shall have to say that their belief was true; if bad, that it was false. But how are we to strike the balance? It is almost impossible to disentangle what the effects have been; and even if we could ascertain them, our judgment as to whether they have been good or bad would depend upon our political opinions. It is surely far easier to discover by direct investigation that the *Contrat Social* is a myth than to decide whether belief in it has done harm or good on the whole.

Another difficulty which I feel in regard to the pragmatic meaning of 'truth' may be stated as follows: Suppose I accept the pragmatic criterion, and suppose you persuade me that a certain belief is useful. Suppose I thereupon conclude that the belief is true. Is it not obvious that there is a transition in my mind from seeing that the belief is useful to actually holding that the belief is true? Yet this could not be so if the pragmatic account of truth were valid. Take, say, the belief that other people exist. According to the pragmatists, to say "it is true that other people exist" *means* "it is useful to believe that other people exist." But if so, then these two phrases are merely different words for the same proposition; therefore when I believe the one I believe the other. If this were so, there could be no transition from the one to the other, as plainly there is. This shows that the word 'true' represents for us a different idea from that represented by the phrase 'useful to believe', and that, therefore, the pragmatic definition of truth ignores, without destroying, the meaning commonly given to the word 'true', which meaning, in my opinion, is of fundamental importance, and can only be ignored at the cost of hopeless inadequacy.

This brings me to the difference between *criterion* and *meaning* – a point on which neither James nor Dr. Schiller is very clear. I may best explain the difference, to begin with, by an instance. If you wish to know whether a certain book is in a library, you consult the catalogue: books mentioned in the catalogue are presumably in the library, books not mentioned in it are presumably not in the library. Thus the catalogue affords a *criterion* of whether a book is in the library or not. But even supposing the catalogue

perfect, it is obvious that when you say the book is in the library you do not *mean* that it is mentioned in the catalogue. You mean that the actual book is to be found somewhere in the shelves. It therefore remains an intelligible hypothesis that there are books in the library which are not yet catalogued, or that there are books catalogued which have been lost and are no longer in the library. And it remains an inference from the discovery that a book is mentioned in the catalogue to the conclusion that the book is in the library. Speaking abstractly, we may say that a property A is a *criterion* of a property B when the same objects possess both; and A is a *useful* criterion of B if it is easier to discover whether an object possesses the property A than whether it possesses the property B. Thus being mentioned in the catalogue is a *useful* criterion of being in the library, because it is easier to consult the catalogue than to hunt through the shelves.

Now if pragmatists only affirmed that utility is a *criterion of* truth, there would be much less to be said against their view. For there certainly seem to be few cases, if any, in which it is clearly useful to believe what is false. The chief criticism one would then have to make on pragmatism would be to deny that utility is a *useful* criterion, because it is so often harder to determine whether a belief is useful than whether it is true. The arguments of pragmatists are almost wholly directed to proving that utility is a *criterion*; that utility is the *meaning* of truth is then supposed to follow. But, to return to our illustration of the library, suppose we had conceded that there are no mistakes in the British Museum catalogue: would it follow that the catalogue would do without the books? We can imagine some person long engaged in a comparative study of libraries, and having, in the process, naturally lost all taste for reading, declaring that the catalogue is the only important thing – as for the books, they are useless lumber; no one ever wants them, and the principle of economy should lead us to be content with the catalogue. Indeed, if you consider the matter with an open mind, you will see that the catalogue is the library, for it tells you everything you can possibly wish to know about the library. Let us, then, save the taxpayers' money by destroying the books: allow free access to the catalogue, but condemn the desire to read as involving an exploded dogmatic realism.

This analogy of the library is not, to my mind, fantastic or unjust, but as close and exact an analogy as I have been able to think of. The point I am trying to make clear is concealed from pragmatists, I think, by the fact that their theories start very often from such things as the general hypotheses of science – ether, atoms, and the like. In such cases, we take little interest in the hypotheses themselves, which, as we well know, are liable to rapid change. What we care about are the inferences as to sensible phenomena which the hypotheses enable us to make. All we ask of the hypotheses is that they should 'work' – though it should be observed that what constitutes 'working' is not the general agreeableness of their results, but the conformity of these

results with observed phenomena. But in the case of these general scientific hypotheses, no sensible man believes that they are true as they stand. They are believed to be true in part, and to work because of the part that is true; but it is expected that in time some element of falsehood will be discovered, and some truer theory will be substituted. Thus pragmatism would seem to derive its notion of what constitutes belief from cases in which, properly speaking, belief is absent, and in which – what is pragmatically important – there is but a slender interest in truth or falsehood as compared to the interest in what 'works'.

But when this method is extended to cases in which the proposition in question has an emotional interest on its own account, apart from its working, the pragmatic account becomes less satisfactory. This point has been well brought out by Professor Stout in *Mind*,[2] and what I have to say is mostly contained in his remarks. Take the question whether other people exist. It seems perfectly possible to suppose that the hypothesis that they exist will always work, even if they do not in fact exist. It is plain, also, that it makes for happiness to believe that they exist — for even the greatest misanthropist would not wish to be deprived of the objects of his hate. Hence the belief that other people exist is, pragmatically, a true belief. But if I am troubled by solipsism, the discovery that a belief in the existence of others is 'true' in the pragmatist's sense is not enough to allay my sense of loneliness: the perception that I should profit by rejecting solipsism is not alone sufficient to make me reject it. For what I desire is not that the belief in solipsism should be false in the pragmatic sense, but that other people should in fact exist. And with the pragmatist's meaning of truth, these two do not necessarily go together. The belief in solipsism might be false even if I were the only person or thing in the universe.

This paradoxical consequence would, I presume, not be admitted by pragmatists. Yet it is an inevitable outcome of the divorce which they make between *fact* and *truth*. Returning to our illustration, we may say that 'facts' are represented by the books, and 'truths' by the entries in the catalogue. So long as you do not wish to read the books, the 'truths' will do in place of the 'facts', and the imperfections of your library can be remedied by simply making new entries in the catalogue. But as soon as you actually wish to read a book, the 'truths' become inadequate, and the 'facts' become all-important. The pragmatic account of truth assumes, so it seems to me, that no one takes any interest in facts, and that the truth of the proposition that your friend exists is an adequate substitute for the fact of his existence. "Facts," they tell us, are neither true nor false, therefore truth cannot be concerned with them. But the truth "A exists," if it is a truth, is concerned with A, who in that case

[2] October, 1907, pp. 586–8. This criticism occurs in the course of a very sympathetic review of Dr. Schiller's *Studies in Humanism*.

is a fact; and to say that "A exists" may be true even if A does not exist is to give a meaning to 'truth' which robs it of all interest. Dr. Schiller is fond of attacking the view that truth must correspond with reality; we may conciliate him by agreeing that *his* truth, at any rate, need not correspond with reality. But we shall have to add that reality is to us more interesting than such truth.

I am, of course, aware that pragmatists minimize the basis of 'fact', and speak of the 'making of reality' as proceeding *pari passu* with the 'making of truth'. It is easy to criticize the claim to 'make reality' except within obvious limits. But when such criticisms are met by pointing to the pragmatist's admission that, after all, there must be a basis of 'fact' for our creative activity to work upon, then the opposite line of criticism comes into play. Dr. Schiller, in his essay on 'the making of reality', minimizes the importance of the basis of 'fact', on the ground (it would seem) that 'facts' will not submit to pragmatic treatment, and that, if pragmatism is true, they are unknowable.[3] Hence, on pragmatistic principles, it is useless to think about facts. We therefore return to fictions with a sigh of relief, and soothe our scruples by calling them 'realities'. But it seems something of a *petitio principii* to condemn 'facts' because pragmatism, though it finds them necessary, is unable to deal with them. And William James, it should be said, makes less attempt than Dr. Schiller does to minimize facts. In this essay, therefore, I have considered the difficulties which pragmatism has to face if it admits 'facts' rather than those (no less serious) which it has to face if it denies them.

It is chiefly in regard to religion that the pragmatist use of 'truth' seems to me misleading. Pragmatists boast much of their ability to reconcile religion and science, and William James, as we saw, professes to have discovered a position combining the merits of tender-mindedness and tough-mindedness. The combination is really effected, if I am not mistaken, in a way of which pragmatists are not themselves thoroughly aware. For their position, if they fully realized it, would, I think, be this: "We cannot know whether, in fact, there is a God or a future life, but we can know that the belief in God and a future life is true." This position, it is to be feared, would not afford much comfort to the religious if it were understood, and I cannot but feel some sympathy with the Pope in his condemnation of it.

"On pragmatic principles," James says, "we cannot reject any hypothesis if consequences useful to life flow from it" (p. 273). He proceeds to point out that consequences useful to life flow from the hypothesis of the Absolute, which is therefore so far a true hypothesis. But it should be observed that these useful consequences flow from the hypothesis that the Absolute is a fact, not from the hypothesis that useful consequences flow from belief in the Absolute. But we cannot believe the hypothesis that the Absolute is a fact merely

[3] Cf. *Studies in Humanism*, pp. 434–6.

because we perceive that useful consequences flow from this hypothesis. What we can believe on such grounds is that this hypothesis is what pragmatists call 'true', i.e. that it is useful; but it is not from this belief that the useful consequences flow, and the grounds alleged do not make us believe that the Absolute is a fact, which is the useful belief. In other words, the useful belief is that the Absolute is a fact, and pragmatism shows that this belief is what it calls 'true'. Thus pragmatism persuades us that belief in the Absolute is 'true', but does not persuade us that the Absolute is a fact. The belief which it persuades us to adopt is therefore not the one which is useful. In ordinary logic, if the belief in the Absolute is true, it follows that the Absolute is a fact. But with the pragmatist's meaning of 'true' this does not follow; hence the proposition which he proves is not, as he thinks, the one from which comforting consequences flow.

In another place James says: "On pragmatistic principles, if the hypothesis of God works satisfactorily in the widest sense of the word, it is true" (p. 299). This proposition is, in reality, a mere tautology. For we have laid down the definition: "The word 'true' means 'working satisfactorily in the widest sense of the word'." Hence the proposition stated by James is merely a verbal variant on the following: "On pragmatistic principles, if the hypothesis of God works satisfactorily in the widest sense of the word, then it works satisfactorily in the widest sense of the word." This would hold even on other than pragmatistic principles; presumably what is peculiar to pragmatism is the belief that this is an important contribution to the philosophy of religion. The advantage of the pragmatic method is that it decides the question of the truth of the existence of God by purely mundane arguments, namely, by the effects of belief in His existence upon our life in this world. But unfortunately this gives a merely mundane conclusion, namely, that belief in God is true, i.e. useful, whereas what religion desires is the conclusion that God exists, which pragmatism never even approaches. I infer, therefore, that the pragmatic philosophy of religion, like most philosophies whose conclusions are interesting, turns on an unconscious play upon words. A common word – in this case, the word 'true' – is taken at the outset in an uncommon sense, but as the argument proceeds, the usual sense of the word gradually slips back, and the conclusions arrived at seem, therefore, quite different from what they would be seen to be if the initial definition had been remembered.

The point is, of course, that, so soon as it is admitted that there are things that exist, it is impossible to avoid recognizing a distinction, to which we may give what name we please, between believing in the existence of something that exists and believing in the existence of something that does not exist. It is common to call the one belief true, the other false. But if, with the pragmatists, we prefer to give a different meaning to the words 'true' and 'false', that does not prevent the distinction commonly called the distinction of 'true' and 'false' from persisting. The pragmatist attempt to ignore this distinction fails,

as it seems to me, because a basis of fact cannot be avoided by pragmatism, and this basis of fact demands the *usual* antithesis of 'true' and 'false'. It is hardly to be supposed that pragmatists will admit this conclusion. But it may be hoped that they will tell us in more detail how they propose to avoid it.

Pragmatism, if I have not misunderstood it, is largely a generalization from the procedure of the inductive sciences. In so far as it lays stress upon the importance of induction, I find myself in agreement with it; and as to the nature of induction also, I think it is far more nearly right than are most of the traditional accounts. But on fundamental questions of philosophy I find myself wholly opposed to it, and unable to see that inductive procedure gives any warrant for its conclusions. To make this clear, I will very briefly explain how I conceive the nature and scope of induction.

When we survey our beliefs, we find that we hold different beliefs with very different degrees of conviction. Some – such as the belief that I am sitting in a chair, or that 2 +2 =4 – can be doubted by few except those who have had a long training in philosophy. Such beliefs are held so firmly that non-philosophers who deny them are put into lunatic asylums. Other beliefs, such as the facts of history, are held rather less firmly, but still in the main without much doubt where they are well authenticated. Beliefs about the future, as that the sun will rise tomorrow and that the trains will run approximately as in Bradshaw, may be held with almost as great conviction as beliefs about the past. Scientific laws are generally believed less firmly, and there is a gradation among them from such as seem nearly certain to such as have only a slight probability in their favour. Philosophical beliefs, finally, will, with most people, take a still lower place, since the opposite beliefs of others can hardly fail to induce doubt. Belief, therefore, is a matter of degree. To speak of belief, disbelief, doubt, and suspense of judgment as the only possibilities is as if, from the writing on the thermometer, we were to suppose that blood heat, summer heat, temperate, and freezing were the only temperatures. There is a continuous gradation in belief, and the more firmly we believe anything, the less willing we are to abandon it in case of conflict.

Besides the degree of our belief, there is another important respect in which a belief may vary, namely, in the extent to which it is *spontaneous* or *derivative*. A belief obtained by inference may be called *derivative*; one not so obtained, *spontaneous*. When we do not need any outside evidence to make us entertain a belief, we may say that what we believe is *obvious*. Our belief in the existence of sensible objects is of this nature: "seeing is believing," and we demand no further evidence. The same applies to certain logical principles, e.g. that whatever follows from a true proposition must be true. A proposition may be obvious in very varying degrees. For example, in matters of aesthetic taste we have to judge immediately whether a work of art is beautiful or not, but the degree of obviousness involved is probably small, so that we feel no very great confidence in our judgment. Thus our spontaneous beliefs are not

necessarily stronger than derivative beliefs. Moreover, few beliefs, if any, are *wholly* spontaneous in an educated man. The more a man has organized his knowledge, the more his beliefs will be interdependent, and the more will obvious truths be reinforced by their connection with other obvious truths. In spite of this fact, however, obviousness remains always the ultimate source of our beliefs; for what is called verification or deduction consists always in being brought into relation with one or more obvious propositions. This process of verification is necessary even for propositions which seem obvious, since it appears on examination that two apparently obvious propositions may be inconsistent, and hence that apparent obviousness is not a sufficient guarantee of truth. We therefore have to subject our beliefs to a process of organization, making groups of such as are mutually consistent, and when two such groups are not consistent with each other, selecting that group which seems to us to contain the most evidence, account being taken both of the degree of obviousness of the propositions it contains and of the number of such propositions. It is as the result of such a process, for example, that we are led, if we are led, to conclude that colours are not objective properties of things. Induction, in a broad sense, may be described as the process of selecting hypotheses which will organize our spontaneous beliefs, preserving as many of them as possible, and interconnecting them by general propositions which, as is said, 'explain' them, i.e. give a ground from which they can be deduced. In this sense, all knowledge is inductive as soon as it is reflective and organized. In any science, there is a greater or less degree of obviousness about many of its propositions: those that are obvious are called *data*; other propositions are only accepted because of their connection with the data. This connection itself may be of two kinds, either that the propositions in question can be deduced from the data, or that the data can be deduced from the propositions in question, and we know of no way of deducing the data without assuming the propositions in question. The latter is the case of working hypotheses, which covers all the general laws of science and all the metaphysics both of common sense and of professed philosophy. It is, apparently, by generalizing the conception of 'working hypothesis' that pragmatism has arisen. But three points seem to me to have been overlooked in this generalization. First, working hypotheses are only a small part of our beliefs, not the whole, as pragmatism seems to think. Secondly, prudent people give only a low degree of belief to working hypotheses; it is therefore a curious procedure to select them as the very types of beliefs in general. Thirdly, pragmatism seems to confound two very different conceptions of 'working'. When *science* says that a hypothesis works, it means that from this hypothesis we can deduce a number of propositions which are verifiable, i.e. obvious under suitable circumstances, and that we cannot deduce any propositions of which the contradictories are verifiable. But when *pragmatism* says that a hypothesis works, it means that the effects of believing it are good, including

among the effects not only the beliefs which we deduce from it, but also the emotions entailed by it or its perceived consequences, and the actions to which we are prompted by it or its perceived consequences. This is a totally difference conception of 'working', and one for which the authority of scientific procedure cannot be invoked. I infer, therefore, that induction, rightly analysed, does not lead us to pragmatism, and that the inductive results which pragmatism takes as the very type of truth are precisely those among our beliefs which should be held with most caution and least conviction.

To sum up: while agreeing with the empirical temper of pragmatism, with its readiness to treat all philosophical tenets as 'working hypotheses', we cannot agree that when we say a belief is true we mean that it is a hypothesis which 'works', especially if we mean by this to take account of the excellence of its effects, and not merely of the truth of its consequences. If, to avoid disputes about words, we agree to accept the pragmatic definition of the word 'truth', we find that the belief that A exists may be 'true' even when A does not exist. This shows that the conclusions arrived at by pragmatism in the sphere of religion do not have the meaning which they appear to have, and are incapable, when rightly understood, of yielding us the satisfaction which they promise. The attempt to get rid of 'fact' turns out to be a failure, and thus the old notion of truth reappears. And if the pragmatist states that utility is to be merely a *criterion* of truth, we shall reply first, that it is not a useful criterion, because it is usually harder to discover whether a belief is useful than whether it is true; secondly, that since no *a priori* reason is shown why truth and utility should always go together, utility can only be shown to be a criterion at all by showing inductively that it accompanies truth in all known instances, which requires that we should already know in many instances what things are true. Finally, therefore, the pragmatist theory of truth is to be condemned on the ground that it does not 'work'.

JAMES AS A PHILOSOPHER

Josiah Royce. "James as a Philosopher." *Science* n.s. 34.863 (14 July 1911): 33–45.

Oration delivered on June 29 at the annual exercises of the Harvard Chapter of Phil Beta Kappa.

Fifty years since, if competent judges were asked to name the American thinkers from whom there had come novel and notable and typical contributions to general philosophy, they could in reply mention only two men – Jonathan Edwards and Ralph Waldo Emerson. For the conditions that determine a fair answer to the question, "Who are your representative American philosophers?" are obvious. The philosopher who can fitly represent the contribution of his nation to the world's treasury of philosophical ideas, must first be one who thinks for himself, fruitfully, with true independence, and with successful inventiveness, about problems of philosophy. And, secondly, he must be a man who gives utterance to philosophical ideas which are characteristic of some stage and of some aspect of the spiritual life of his own people. In Edwards and in Emerson, and only in these men, had these two conditions found their fulfilment, so far as our American civilization had yet expressed itself in the years that had preceded our civil war. Edwards, in his day, made articulate some of the great interests that had moulded our early religious life. The thoughts which he most discussed were indeed, in a sense, old, since they largely concerned a traditional theology. Yet both in theology and general philosophy, Edwards was an originator. For he actually rediscovered some of the world's profoundest ideas regarding God and humanity simply by reading for himself the meaning of his own religious experience. With a mysterious power of philosophical intuition, even in his early youth, he observed what, upon the basis of what we know to have been his range of philosophical reading, we could not possibly have expected him to observe. If the sectarian theological creed that he defended was to our minds narrow, what he himself saw was very far-reaching and profound. For he viewed religious problems with synoptic vision that enabled him to reconcile, in his own personal way, some of the greatest and most tragic conflicts of the spiritual world, and what he had to say consequently far transcended the interests of the special theological issues which he discussed. Meanwhile, he spoke not merely as a thinker, but as one

who gave voice to some of the central motives and interests of our colonial religious life. Therefore he was, in order of time the first of our nationally representative philosophers.

Another stage of our civilization – a later phase of our national ideals – found its representative in Emerson. He too was in close touch with many of the world's deepest thoughts concerning ultimate problems. Some of the ideas that most influenced him have their far-off historical origins in oriental as well as in Greek thought, and also their nearer foreign sources in modern European philosophy. But he transformed whatever he assimilated. He invented upon the basis of his personal experience, and so he was himself no disciple of the orient, or of Greece, still less of England and of Germany. He thought, felt and spoke as an American.

Fifty years ago, I say, our nation had so far found these two men to express each his own stage of the philosophy of our national civilization. The essence of a philosophy, in case you look at it solely from a historical point of view, always appears to you thus: A great philosophy expresses an interpretation of the life of man and a view of the universe, which is at once personal, and if the thinker is representative of his people, national in its significance. Edwards and Emerson had given tongue to the meaning of two different stages of our American culture. And these were thus far our only philosophical voices.

To-day, if we ask any competent foreign critic of our philosophy whether there is any other name to be added to these two classic American philosophers, we shall receive the unanimous answer: "There is today a third representative American philosopher. His name is William James." For James meets the two conditions just mentioned. He has thought for himself, fruitfully, with true independence, and with successful inventiveness. And he has given utterance to ideas which are characteristic of a stage of an aspect of the spiritual life of this people. He, too, has been widely and deeply affected by the history of thought. But he has reinterpreted all these historical influences in his own personal way. He has transformed whatever he has assimilated. He has rediscovered whatever he has received from without; because he never could teach what he had not himself experienced. And, in addition, he has indeed invented effectively and richly. Moreover, in him certain characteristic aspects of our national civilization have found their voice. He is thus the third in the order of time among our representative American philosophers. Already, within a year of his death, he has begun to acquire something of a classic rank and dignity. In future this rank and dignity will long increase. In one of James's latest utterances he indeed expressed, with characteristic energy, a certain abhorrence of what he called classical tendencies in philosophical thought. But I must repeat the word: Fortune not unjustly replies, and will reply to James's vigorous protest against every form of classicism, by making him a classic.

Thus, then, from the point of view of the competent foreign students of our philosophy, the representative American philosophers are now three and only three – Edwards, Emerson, James.

And of these three there can be little question that, at the present time, the most widely known abroad is James. Emerson has indeed found a secure place in the minds of the English-speaking lovers of his type of thought everywhere; and has had an important part in the growth of some modern German tendencies. But James has already won, in the minds of French, of German, of Italian, and of still other groups of foreign readers, a position which gives him a much more extended range of present influence than Emerson has ever possessed.

It is my purpose, upon the present occasion, to make a few comments upon the significance of William James's philosophy. This is no place for the discussion of technical matters. Least of all have I any wish to undertake to decide, upon this occasion, any controversial issues. My intentions as I address you are determined by very simply and obvious considerations. William James was my friend from my youth to the end of his beneficent life. I was once for a brief time his pupil. I long loved to think of myself as his disciple; although perhaps I was always a very bad disciple. But now he has just left us. And as I address you I remember that he was your friend also. Since the last annual meeting of this assembly he has been lost to us all. It is fitting that we should recall his memory to-day. Of personal reminiscences, of biographical sketches, and of discussions relating to many details of his philosophy, the literature that has gathered about his name during the few months since we lost him, has been very full. But just as this is no occasion for technical discussion of his philosophy so too I think this is no place to add new items to the literature of purely personal reminiscence and estimate of James. What I shall try to do is this: I have said that James is an American philosopher of classic rank, because he stands for a stage in our national self-consciousness – for a stage with which historians of our national mind must always reckon. This statement, if you will permit, shall be my text. I shall devote myself to expounding this text as well as I can in my brief time, and to estimating the significance of the stage in question, and of James's thought in so far as it seems to me to express the ideas and the ideals characteristic of this phase of our national life.

I

In defining the historical position which William James, as a thinker, occupies, we have of course to take account, not only of national tendencies, but also of the general interests of the world's thought in his time. William James began his work as a philosopher, during the seventies of the last century, in years which were, for our present purpose, characterized by two

notable movements of world-wide significance. These two movements were at once scientific in the more special sense of that term, and philosophical in the broad meaning of that word. The first of the movements was concerned with the elaboration – the widening and the deepening of the newer doctrines about evolution. This movement had indeed been preceded by another. The recent forms of evolutionary doctrine, those associated with the names of Darwin and of Spencer, had begun rapidly to come into prominence about 1860. And the decade from 1860 to 1870, taken together with the opening years of the next decade, had constituted what you may call the storm and stress period of Darwinism, and of its allied tendencies, such as those which Spencer represented. In those years the younger defenders of the new doctrines so far as they appealed to the general public, fought their battles, declared their faith, out of weakness were made strong and put to flight the armies of the theologians. You might name, as a closing event of that storm and stress period, Tyndall's famous Belfast address of 1874, and the warfare waged about that address. Haeckel's early works, some of Huxley's most noted polemic essays, Lange's "History of Materialism," the first eight or nine editions of Von Hartmann's "Philosophy of the Unconscious," are documents characteristic of the more general philosophical interests of that time. In our country, Fiske's "Cosmic Philosophy" reflected some of the notable features that belonged to these years of the early conquests of evolutionary opinion.

Now in that storm and stress period, James had not yet been before the public. But his published philosophical work began with the outset of the second and more important period of evolutionary thought – the period of the widening and deepening of the new ideas. The leaders of thought who are characteristic of this second period no longer spend their best efforts in polemic in favor of the main ideas of the newer forms of the doctrine of evolution. In certain of its main outlines – outlines now extremely familiar to the public – they simply accept the notion of the natural origin of organic forms and of the general continuity of the processes of development. But they are concerned, more and more, as time goes on, with the deeper meaning of evolution, with the study of its factors, with the application of the new ideas to more and more fields of inquiry, and, in case they are philosophers, with the reinterpretation of philosophical traditions in the light of what had resulted from that time of storm and stress.

James belongs to this great second stage of the evolutionary movement, to the movement of the elaboration, of the widening and deepening of evolutionary thought, as opposed to that early period of the storm and stress. We still live in this second stage of evolutionary movement. James is one of its most inventive philosophical representatives. He hardly ever took part in the polemic in favor of the general evolutionary ideas. Accepting them, he undertook to interpret and apply them.

And now, secondly, the period of James's activity is the period of the rise of the new psychology. The new psychology has stood for many other interests besides those of a technical study of the special sciences of the human and of the animal mind. What is technical about psychology is indeed important enough. But the special scientific study of mind by the modern methods used in such study has been a phase and a symptom of a very much larger movement – a movement closely connected with all that is most vital in recent civilization, with all the modern forms of nationalism, of internationalism, of socialism, and of individualism. Human life has been complicated by so many new personal and social problems, that man has needed to aim, by whatever means are possible, towards a much more elaborate knowledge of his fellow-man than was ever possible before. The results of this disposition appear in the most widely diverse sciences and arts. Archeology and ethnology, history and the various social sciences, dramatic art, the novel, as well as what has been called psychical research – in a word, all means, good and bad, that have promised either a better knowledge of what man is or a better way of portraying what knowledge of man one may possess – have been tried and moulded in recent times by the spirit of which recent technical psychology is also an expression. The psychological movement means then something that far transcends the interests of the group of sciences to which the name psychology now applies. And this movement assumed some of its most important recent forms during the decade in which James began to publish his work. His own contributions to psychology reflect something of the manifoldness and of the breadth of the general psychological movement itself. If he published the two great volumes entitled "Psychology" he also wrote "The Varieties of Religious Experience," and he played his part in what is called "psychical research."

These then are James's two principal offices when you consider him merely in his most general relations to the thought of the world at large in his time. He helped in the work of elaborating and interpreting evolutionary thought. He took a commanding part in the psychological movement.

II

But now it is not of these aspects of James's work, significant as they are, that I have here especially to speak. I must indeed thus name and emphasize these wider relations of this thought to the world's contemporary thought. But I do so in order to give the fitting frame to our picture. I now have to call attention to the features about James which make him, with all his universality of interest, a representative American thinker. Viewed as an American, he belongs to the movement which has been the consequences first, of our civil war, and secondly, of the recent expansion, enrichment, and entanglement of our social life. He belongs to the age in which our nation, rapidly transformed

by the occupation of new territory, by economic growth, by immigration and by education, has been attempting to find itself anew, to redefine its ideals, to retain its moral integrity, and yet to become a world power. In this stage of our national consciousness we still live and shall plainly have to live for a long time in the future. The problems involved in such a civilization we none of us well understand; least of all do I myself understand them. And James, scholar, thinker, teacher, scientific and philosophical writer as he was, has of course only such relation to our national movement as is implied by the office that he thus fulfills. Although he followed with keen interest a great variety of political and social controversies, he avoided public life. Hence he was not absorbed by the world of affairs, although he was always ready to engage generously in the discussion of practical reforms. His main office with regard to such matters was therefore that of philosophical interpreter. He helped to enlighten his fellows as to the relations between the practical problems of our civilization and those two world-wide movements of thought of which I have just spoken.

Let me call attention to some of the results of James's work as interpreter of the problems of the American people. I need not say that this work was, to his own mind, mainly incidental to his interest in those problems of evolutionary thought and of psychology to which I just directed your attention. I am sure that James himself was very little conscious that he was indeed an especially representative American philosopher. He certainly had no ambition to vaunt himself as such. He worked with a beautiful and hearty sincerity upon the problems that as a fact interested him. He knew that he loved these problems because of their intense human interest. He knew, then, that he was indeed laboring in the service of mankind. But he so loved what he called the concrete, the particular, the individual, that he naturally made little attempt to define his office in terms of any social organism, or of any such object as our national life, viewed as an entity. And he especially disliked to talk of causes in the abstract, or of social movements as I am here characterizing them. His world seemed to him to be made up of individuals – men, events, experiences and deeds. And he always very little knew how important he himself was, or what vast inarticulate social forces were finding in him their voice. But we are now viewing James from without, in a way that is of course as imperfect as it is inevitable. We therefore have a right at this point to attribute to him an office that, as I believe, he never attributed to himself.

And here we have to speak first of James's treatment of religious problems, and then of his attitude towards ethics.

Our nation since the civil war has largely lost touch with the older forms of its own religious life. It has been seeking for new embodiments of the religious consciousness, for creeds that shall not be in conflict with the modern man's view of life. It was James's office, as psychologist, and as philosopher, to give a novel expression to this our own national variety of the

spirit of religious unrest. And his volume "The Varieties of Religious Experience," is one that, indeed, with all its wealth of illustration, and in its courageous enterprise, has a certain classic beauty. Some men preach new ways of salvation. James simply portrayed the meaning that the old ways of salvation had possessed, or still do possess, in the inner and personal experience of those individuals whom he has called the religious geniuses. And then he undertook to suggest an hypothesis as to what the whole religious process might mean. The hypothesis is on the one hand in touch with certain tendencies of recent psychology. And in so far it seems in harmony with the modern consciousness. On the other hand it expresses, in a way, James's whole philosophy of life. And in this respect it comes into touch with all the central problems of humanity.

The result of this portrayal was indeed magical. The psychologists were aided towards a new tolerance in their study of religion. The evolution of religion appeared in a new light. And meanwhile many of the faithful, who had long been disheartened by the later forms of evolutionary naturalism, took heart anew when they read James's vigorous appeal to the religious experience of the individual as to the most authoritative evidence for religion. "The most modern of thinkers, the evolutionist, the psychologist," they said, "the heir of all the ages, has thus vindicated anew the witness of the spirit in the heart – the very source of inspiration in which we ourselves have always believed." And such readers went away rejoicing, and some of them even began to write christologies abased upon the doctrine of James as they understood it. The new gospel, the glad tidings of the subconscious, began to be preached in many lands. It has even received the signal honor of an official papal condemnation.

For my own part, I have ventured to say elsewhere that the new doctrine, viewed in one aspect, seems to leave religion in the comparatively trivial position of a play with whimsical powers – a prey to endless psychological caprices. But James's own robust faith was that the very caprices of the spirit are the opportunity for the building-up of the highest forms of the spiritual life, that the unconventional and the individual in religious experience are the means whereby the truth of a superhuman world may become most manifest. And this robust faith of James, I say, whatever you may think of its merits, is as American in type as it has already proved effective in the expression which James gave to it. It is the spirit of the frontiersman, of the gold seeker, or the home builder, transferred to the metaphysical and to the religious realm. There is our far-off home, our long-lost spiritual fortune. Experience alone can guide us towards the place where these things are; hence you indeed need experience. You can only win your way on the frontier in case you are willing to live there. Be, therefore, concrete, be fearless, and be experimental. But, above all, let not your abstract conceptions, even if you call them scientific conceptions, pretend to set any limits to the richness of spiritual grace,

to the glories of spiritual possession, that, in case you are duly favored, your personal experience may reveal to you. James reckons that the tribulations with which abstract scientific theories have beset our present age are not to be compared with the glory that perchance shall be, if only we open our eyes to what experience itself has to reveal to us.

In the quest for the witness to whom James appeals when he tests his religious doctrine, he indeed searches the most varied literature; and of course most of the records that he consults belong to foreign lands. But the book called "The Varieties of Religious Experience" is full of the spirit that, in our country, has long been effective in the formation of new religious sects; and this volume expresses, better than any sectarian could express, the recent efforts of this spirit to come to an understanding with modern naturalism, and with the new psychology. James's view of religious experience is meanwhile at once deliberately unconventional and intensely democratic. The old world types of reverence for the external forms of the church find no place in his pages; but equally foreign to his mind is that barren hostility of the typical European free thinkers for the church with whose traditions they have broken. In James's eyes, the forms, the external organizations of the religious world simply wither; it is the individual that is more and more. And James, with a democratic contempt for social appearances, seeks his religious geniuses everywhere. World-renowned saints of the historic church receive his hearty sympathy; but they stand upon an equal footing, in his esteem, with many an obscure and ignorant revivalist, with faith healers, with poets, with sages, with heretics, with men that wander about in all sorts of sheepskins and goatskins, with chance correspondents of his own, with whomsoever you will of whom the world was not and is not worthy, but who, by inner experience, have obtained the substance of things hoped for, the evidence of things not seen.

You see, of course, that I do not believe James's resulting philosophy of religion to be adequate. For as it stands it is indeed chaotic. But I am sure that is can only be amended by taking it up into a larger view, and not by rejecting it. The spirit triumphs, not by destroying the chaos that James describes, but by brooding upon the face of the deep until the light comes, and with light, order. But I am sure also that we shall always have to reckon with James's view. And I am sure also that only an American thinker could have written this survey, with all its unconventional ardor of appreciation, with all its democratic catholicity of sympathy, with all its freedom both from ecclesiastical formality and from barren free thinking. I am sure also that no book has better expressed the whole spirit of hopeful unrest, of eagerness to be just to the modern view of life, of longing for new experience, which characterizes the recent American religious movement. In James's book then the deeper spirit of our national religious life has found its most manifold and characteristic expression.

III

I must next turn to the other of the two aspects of James's work as a thinker that I mentioned above, namely to his ethical influence. Since the war our transformed and restless people has been seeking not only for religious, but for moral guidance. What are the principles that can show us the course to follow in the often pathless wilderness of the new democracy? It frequently seems as if, in every crisis of our greater social affairs we needed somebody to tell us both our dream and the interpretation thereof. We are eager to have life, and that abundantly. But what life? And by what test shall we know the way of life?

The ethical maxims that most readily meet the popular demand for guidance in such a country, and at such a time, are maxims that combine attractive vagueness with an equally winning pungency. They must seem obviously practical; but must not appear excessively rigorous. They must arouse a large enthusiasm for action, without baffling us with the sense of restraint, or of wearisome self-control. They must not call for extended reflection. Despite their vagueness they must not appear abstract, nor yet hard to grasp. The wayfaring man, though a fool, must be sure that he at least will not err in applying our moral law. Moral blunders must be natural only to opponents, not to ourselves. We must be self-confident. Moreover, our moral law must have an athletic sound. Its first office is to make us "good sports." Only upon such a law can we mediate day and night, in case the "game" leaves us indeed any time for meditation at all. Nevertheless, these popular maxims will of course not be meant as mere expressions of blind impulse. On the contrary, they will appeal to highly intelligent minds, but to minds anxious for relief from the responsibility of being too thoughtful. In order to be easily popular they must be maxims that stir the heart, not precisely indeed like the sound of a trumpet, but more like the call of the horn of an automobile. You will have in mind the watchwords that express some of the popular ethical counsels thus suggested. One of these watchwords has of late enabled us to abbreviate a well-known and surely a highly intelligent maxim, to something that is to-day used almost as a mere injection. It is the watchword, "Efficiency"! Another expression of the same motive takes shape in the equally familiar advice, "Play the game."

Now I do not mean to make light of the real significance of just such moral maxims, for awakening and inspiring just our people in this day. The true value of these maxims lies for us in three of their characteristic features. First, they give us counsel that is in any case opposed to sloth. And sloth on every level of our development remains one of the most treacherous and mortal enemies of the moral will. Secondly, they teach us to avoid the dangers to which the souls of Hamlet's type fall a prey. That is, they discourage the spirit that reflectively divides the inner self, and that leaves it divided. They warn us that the divided self is indeed, unless it can heal its deadly wound, by fitting

action, a lost soul. And thirdly, they emphasize courage. And courage – not, to be sure, so much the courage that faces one's rivals in the market place, or one's foes on the battlefield as the courage that fits us to meet our true spiritual enemies – the courage that arises anew from despair and that undertakes, despite all tribulations, to overcome the world – such courage is one of the central treasures of the moral life.

Because of these three features, the maxims to which I refer are in all their vagueness, vehicles of wisdom. But they express themselves in their most popular forms with a wilfulness that is often more or less comic, and that is sometimes tragic. For what they do not emphasize is the significance of self-possession, of lifting up our eyes to the hills whence cometh our help, of testing the life that now is by the vision of the largest life that we can in ideal appreciate. These popular maxims also emphasize results rather than ideals, strength rather than cultivation, temporary success rather than wholeness of life, the greatness of "Him that taketh a city," rather than of "Him that ruleth his spirit." They are the maxims of unrest, of impatience and of certain humane and generous unscrupulousness, as fascinating as it is dangerous. They characterize a people that is indeed earnestly determined to find itself, but that so far has not found itself.

Now one of the most momentous problems regarding the influence of James is presented by the question: How did he stand related to these recent ethical tendencies of our nation? I may say at once that, in my opinion, he has just here proved himself to be most of all and in the best sense our national philosopher. For the philosopher must not be an echo. He must interpret. He must know us better than we know ourselves, and this is what indeed James has done for our American moral consciousness. For, first, while he indeed made very little of the formal office of an ethical teacher and seldom wrote upon technical ethical controversies, he was, as a fact, profoundly ethical in his whole influence. And next, he fully understood, yes shared in a rich measure, the motives to which the ethical maxims just summarized have given expression. Was not he himself restlessly active in his whole temperament? Did he not love individual enterprise and its free expression? Did he not loathe what seemed to him abstractions? Did he not insist that the moralist must be in close touch with concrete life? As psychologist did he not emphasize the fact that the very essence of conscious life lies in its active, yes, in its creative relation to experience? Did he not counsel the strenuous attitude towards our tasks? And are not all these features in harmony with the spirit from which the athletic type of morality just sketched seems to have sprung?

Not only is all this true of James, but, in the popular opinion of the moment, the doctrine called pragmatism, as he expounded it in his Lowell lectures, seems, to many of his foreign critics, and to some of those who think themselves his best followers here at home, a doctrine primarily ethical in its force, while, to some minds, pragmatism seems also to be a sort of philo-

sophical generalization of the efficiency doctrine just mentioned. To be sure, any closer reader of James's "Pragmatism" ought to see that his true interests in the philosophy of life are far deeper than those which the maxims "Be efficient," and, "Play the game" most emphasize. And, for the rest, the book on pragmatism is explicitly the portrayal of a method of philosophical inquiry, and is only incidentally a discourse upon ethically interesting matters. James himself used to protest vigorously against the readers who ventured to require of the pragmatist viewed simply as such, any one ethical doctrine whatever. In his book on "Pragmatism" he had expounded, as he often said, a method of philosophizing, a definition of truth, a criterion for interpreting and testing theories. He was not there concerned with ethics. A pragmatist was free to decide moral issues as he chose, so long as he used the pragmatic method in doing so, that is, so long as he tested ethical doctrines by their concrete results, when they were applied to life.

Inevitably, however, the pragmatic doctrine that both the meaning and the truth of ideas shall be tested by their empirical consequences of these ideas and by the practical results of acting them out in life, has seemed both to many of James's original hearers, and to some of the foreign critics just mentioned, a doctrine that is simply a characteristic Americanism in philosophy – a tendency to judge all ideals by their practical efficiency, by their visible results, by their so-called "cash values."

James, as I have said, earnestly protested against this cruder interpretation of his teaching. The author of "The Varieties of Religious Experience" and of the "Pluralistic Universe" was indeed an empiricist, a lover of the concrete and a man who looked forward to the future rather than backward to the past; but despite his own use, in his "Pragmatism" of the famous metaphor of the "cash values" of ideas, he was certainly not a thinker who had set his affections upon things below rather than upon things above. And the "consequences" upon which he laid stress when he talked of the pragmatic test for ideas, were certainly not the merely worldly consequences of such ideas in the usual sense of the word "worldly." He appealed always to experience; but then for him, experience might be, and sometimes was, religious experience – experience of the unseen and of the super-human. And so James was right in his protest against these critics of his later doctrine. His form of pragmatism was indeed a form of Americanism in philosophy. And he too had his fondness for what he regarded as efficiency, and for those who "play the game," whenever the game was one that he honored. But he also loved too much those who are weak in the eyes of this present world – the religious geniuses, the unpopular inquirers, the noble outcasts. He loved them, I say, too much to be the dupe of the cruder forms of our now popular efficiency doctrine. In order to win James's most enthusiastic support, ideas and men needed to express an intense inner experience along with a certain unpopularity which showed that they deserved sympathy. Too much worldly success,

on the part of men or of ideas, easily alienated him. Unworldliness was one of the surest marks, in his eyes, of spiritual power, if only such unworldliness seemed to him to be joined with interests that, using his favorite words, he could call "concrete" and "important."

In light of such facts, all that he said about judging ideas by their "consequences" must be interpreted, and therefore it is indeed unjust to confound pragmatism with the cruder worship of efficiency.

IV

Yet, I repeat, James's philosophy of life was indeed, in its ethical aspects, an expression of the better spirit of our people. He understood, he shared, and he also transcended the American spirit. And just that is what most marks him as our national philosopher. If you want to estimate his philosophy of life in its best form, you must read or re-read, not the "Pragmatism," but the essays contained in the volume entitled "The Will to Believe."

May I still venture, as I close, to mention a few features of the doctrine that is embodied in that volume? The main question repeatedly considered in these essays of James is explicitly the question of an empiricist, of a man averse to abstractions, and of an essentially democratic thinker, who does not believe that any final formulation of an ideal of human life is possible until the last man has had his experience of life, and has uttered his word. But this empiricism of the author is meanwhile the empiricism of one who especially emphasizes the central importance of the active life as the basis of our interpretation of experience. Herein James differs from all traditional positivists. Experience is never yours merely as it comes to you. Facts are never mere data. They are data to which you respond. Your experience is constantly transformed by your deeds. That this should be the case is determined by the most essential characteristics of your consciousness. James asserts this latter thesis as psychologist, and has behind him, as he writes, the vast mass of evidence that his two psychological volumes present. The simplest perception, the most elaborate scientific theory, illustrate how man never merely finds, but also always cooperates in creating his world.

No doubt then life must be estimated and guided with constant reference to experience, to consequences, to actual accomplishments, to what we Americans now call efficiency. But on the other hand efficiency itself is not to be estimated in terms of mere data. Our estimate of our world is not to be forced upon us by any mere inspection of consequences. What makes life worth living is not what you find in it, but what you are ready to put into it by your ideal interpretation of the meaning that, as you insist, it shall possess for you. This ideal meaning is always for you a matter of faith not to be imposed coercively upon another, but also never to be discovered by watching who it is that wins, or by merely feeling your present worldly strength as a

player of the game. Your deeper ideals always depend upon viewing life in the light of larger unities than now appear, upon viewing yourself as a co-worker with the universe for the attainment of what no present human game of action can now reveal. For this "radical empiricist" then present experience always points beyond itself to a realm that no human eye has yet seen – an empirical realm of course, but one that you have a right to interpret in terms of a faith that is itself active, but that is not merely worldly and athletic. The philosophy of action thus so imperfectly suggested by the few phrases that I have time to use, can best be interpreted, for the moment, by observing that the influence of Carlyle in many passages of this volume is as obvious as it is by our author independently reinterpreted and transformed. Imagine Carlyle transformed into a representative American thinker, trained as a naturalist, deeply versed in psychology, deprived of his disposition to hatred, open-minded towards the interests of all sorts and conditions of men, still a hero worshiper, but one whose heroes could be found in the obscurest lovers of the ideal as easily as in the most renowned historical characters; let this transformed Carlyle preach the doctrine of the resolute spirit triumphant through creative action, defiant of every degree of mortal suffering. Let him proclaim "The Everlasting Yea" in the face of all the doubts of erring human opinion: and herewith you gain some general impression of the relations that exist between "Sartor Resartus" and "The Will to Believe."

The ethical maxims which are scattered through these pages voluntarily share much of the vagueness of our age of tentative ethical effort. But they certainly are not the maxims of an impressionist, of a romanticist, or of a partisan of merely worldly efficiency. They win their way through all such attitudes to something beyond – to a resolute interpretation of human life as an opportunity to cooperate with the superhuman and the divine. And they do this, in the author's opinion, not by destroying, but by fulfilling the purposes and methods of the sciences of experience themselves. Is not every scientific theory a conceptual reinterpretation of our fragmentary perceptions, an active reconstruction, to be tried in the service of a larger life? Is not our trust in a scientific theory a conceptual reinterpretation of our fragmentary perceptions, an active reconstruction, to be tried in the service of a larger life? Is not our trust in a scientific theory itself an act of faith? Moreover, these ethical maxims are here governed, in James's exposition, by the repeated recognition of certain essentially absolute truths, truths that, despite his natural horror of absolutism, he here expounds with a finished dialectic skill that he himself, especially in his later polemic period, never seemed to prize at its full value. The need of active faith in the unseen and the superhuman he founds upon these simply and yet absolutely true principles, principles of the true dialectics of life: First, every great decision of practical life requires faith, and has irrevocable consequences, consequences that belong to the whole great world, and that therefore have endless possible importance.

Secondly, since action and belief are thus inseparably bound together, our right to believe depends upon our right, as active begins, to make decisions. Thirdly, our duty to decide life's greater issues is determined by the absolute truth that, in critical cases, the will to be doubtful and not to decide life's greater issues is determined by the absolute truth that, in critical cases, the will to be doubtful and not to decide, is itself a decision, and is hence no escape from our responsible moral position. And this our responsible position is a position that gives us our place in and for all future life. The world needs our deeds. We need to interpret the world in order to act. We have a right to interpret the universe so as to enable us to act at once decisively, courageously and with the sense of the inestimable preciousness and responsibility of the power to act.

In consequence of all these features of his ethical doctrine a wonderful sense of the deep seriousness and of the possibly divine significance of every deed is felt in James's every ethical counsel. Thus it is that while fully comprehending the American spirit which we have sketched, he at once expresses it and transforms it. He never loved Fichte; but there is much of the best of the ethical idealism of Fichte in "The Will to Believe." Many of you have enjoyed James's delightfully skilful polemic against Hegel, and against the external forms, phrases and appearances of the later constructive idealists. I have no wish here to attempt to comment upon that polemic; but I can assure you that I myself learned a great part of my own form of absolute idealism from the earliest expressions that James gave to the thoughts contained in "The Will to Believe." As one of his latest works, "The Pluralistic Universe," still further showed, he himself was in spirit an ethical idealist to the core. Nor was he nearly so far in spirit even from Hegel as he supposed, guiltless as he was of Hegel's categories. Let a careful reading of the "Pluralistic Universe" make this fact manifest.

Meanwhile, what interests us is that, in "The Will to Believe," as well as in "The Pluralistic Universe," this beautifully manifold, appreciative and humane mind, at once adequately expressed, and, with true moral idealism transcended the caprices of recent American ethics. To this end he lavishly used the resources of the naturalist, of the humanist, and of the ethical dialectician. He saw the facts of human life as they are, and he resolutely lived beyond them into the realm of the spirit. He loved the concrete but he looked above towards the larger realm of universal life. He often made light of the abstract reason, but in his own plastic and active way he uttered some of the great words of the universal reason, and he has helped his people to understand and to put into practice these words.

I ask you to remember him then, not only as the great psychologist, the radical empiricist, the pragmatist, but as the interpreter of the ethical spirit of his time and of his people – the interpreter who has pointed the way beyond the trivialities which he so well understood and transcended towards that

"Rule of Reason" which the prophetic maxim of our supreme court has just brought afresh to the attention of our people. That "Rule of Reason," when it comes, will not be a mere collection of abstractions. It will be, as James demanded, something concrete and practical. And it will indeed appeal to our faith as well as to our discursive logical processes. But it will express the transformed and enlightened American spirit as James already began to express it. Let him too be viewed as a prophet of the nation that is to be.

WILLIAM JAMES

George Santayana. "William James." *Character and Opinion in the United States* (New York: Charles Scribner's Sons, 1920), chap. 3, pp. 64–96.

William James enjoyed in his youth what are called advantages: he lived among cultivated people, travelled, had teachers of various nationalities. His father was one of those somewhat obscure sages whom early America produced: mystics of independent mind, hermits in the desert of business, and heretics in the churches. They were intense individualists, full of veneration for the free souls of their children, and convinced that every one should paddle his own canoe, especially on the high seas. William James accordingly enjoyed a stimulating if slightly irregular education: he never acquired that reposeful mastery of particular authors and those safe ways of feeling and judging which are fostered in great schools and universities. In consequence he showed an almost physical horror of club sentiment and of the stifling atmosphere of all officialdom. He had a knack for drawing, and rather the temperament of the artist; but the unlovely secrets of nature and the troubles of man preoccupied him, and he chose medicine for his profession. Instead of practising, however, he turned to teaching physiology, and from that passed gradually to psychology and philosophy.

In his earlier years he retained some traces of polyglot student days at Paris, Bonn, Vienna, or Geneva; he slipped sometimes into foreign phrases, uttered in their full vernacular; and there was an occasional afterglow of Bohemia about him, in the bright stripe of a shirt or the exuberance of a tie. On points of art or medicine he retained a professional touch and an unconscious ease which he hardly acquired in metaphysics. I suspect he had heartily admired some of his masters in those other subjects, but had never seen a philosopher whom he would have cared to resemble. Of course there was nothing of the artist in William James, as the artist is sometimes conceived in England, nothing of the aesthete, nothing affected or limp. In person he was short rather than tall, erect, brisk, bearded, intensely masculine. While he shone in expression and would have wished his style to be noble if it could also be strong, he preferred in the end to be spontaneous, and to leave it at that; he tolerated slang in himself rather than primness. The rough, homely, picturesque phrase, whatever was graphic and racy, recommended itself to him; and his conversation outdid his writing in this respect. He believed in improvisation, even in thought; his lectures were not minutely prepared.

Know your subject thoroughly, he used to say, and trust to luck for the rest. There was a deep sense of insecurity in him, a mixture of humility with romanticism: we were likely to be more or less wrong anyhow, but we might be wholly sincere. One moment should respect the insight of another, without trying to establish too regimental a uniformity. If you corrected yourself tartly, how could you know that the correction was not the worse mistake? All our opinions were born free and equal, all children of the Lord, and if they were not consistent that was the Lord's business, not theirs. In reality, James was consistent enough, as even Emerson (more extreme in this sort of irresponsibility) was too. Inspiration has its limits, sometimes very narrow ones. But James was not consecutive, not insistent; he turned to a subject afresh, without egotism or pedantry; he dropped his old points, sometimes very good ones; and he modestly looked for light from others, who had less light than himself.

His excursions into philosophy were accordingly in the nature of raids, and it is easy for those who are attracted by one part of his work to ignore other parts, in themselves perhaps more valuable. I think that in fact his popularity does not rest on his best achievements. His popularity rests on three somewhat incidental books, *The Will to Believe*, *Pragmatism*, and *The Varieties of Religious Experience*, whereas, as it seems to me, his best achievement is his *Principles of Psychology*. In this book he surveys, in a way which for him is very systematic, a subject made to his hand. In its ostensible outlook it is a treatise like any other, but what distinguishes it is the author's gift for evoking vividly the very life of the mind. This is a work of imagination; and the subject as he conceived it, which is the flux of immediate experience in men in general, requires imagination to read it at all. It is a literary subject, like autobiography or psychological fiction, and can be treated only poetically; and in this sense Shakespeare is a better psychologist than Locke or Kant. Yet this gift of imagination is not merely literary; it is not useless in divining the truths of science, and it is invaluable in throwing off prejudice and scientific shams. The fresh imagination and vitality of William James led him to break through many a false convention. He saw that experience, as we endure it, is not a mosaic of distinct sensations, nor the expression of separate hostile faculties, such as reason and the passions, or sense and the categories; it is rather a flow of mental discourse, like a dream, in which all divisions and units are vague and shifting, and the whole is continually merging together and drifting apart. It fades gradually in the rear, like the wake of a ship, and bites into the future, like the bow cutting the water. For the candid psychologist, carried bodily on this voyage of discovery, the past is but a questionable report, and the future wholly indeterminate; everything is simply what it is experienced as being.

At the same time, psychology is supposed to be a science, a claim which would tend to confine it to the natural history of man, or the study of

behaviour, as is actually proposed by Auguste Comte and by some of James's own disciples, more jejune if more clear-headed than he. As matters now stand, however, psychology as a whole is not a science, but a branch of philosophy; it brings together the literary description of mental discourse and the scientific description of material life, in order to consider the relation between them, which is the nexus of human nature.

What was James's position on this crucial question? It is impossible to reply unequivocally. He approached philosophy as mankind originally approached it, without having a philosophy, and he lent himself to various hypotheses in various directions. He professed to begin his study on the assumptions of common sense, that there is a material world which the animals that live in it are able to perceive and to think about. He gave a congruous extension to this view in his theory that emotion is purely bodily sensation, and also in his habit of conceiving the mind as a total shifting sensibility. To pursue this path, however, would have led him to admit that nature was automatic and mind simply cognitive, conclusions from which every instinct in him recoiled. He preferred to believe that mind and matter had independent energies and could lend one another a hand, matter operating by motion and mind by intention. This dramatic, amphibious way of picturing causation is natural to common sense, and might be defended if it were clearly defined; but James was insensibly carried away from it by a subtle implication of his method. This implication was that experience or mental discourse not only constituted a set of substantive facts, but the *only* substantive facts; all else, even that material world which his psychology had postulated, could be nothing but a verbal or fantastic symbol for sensations in their experienced order. So that while nominally the door was kept open to any hypothesis regarding the conditions of the psychological flux, in truth the question was prejudged. The hypotheses, which were parts of this psychological flux, could have no object save other parts of it. That flux itself, therefore, which he could picture so vividly, was the fundamental existence. The *sense* of bounding over the waves, the *sense* of being on an adventurous voyage, was the living fact; the rest was dead reckoning. Where one's gift is, there will one's faith be also; and to this poet appearance was the only reality.

This sentiment, which always lay at the back of his mind, reached something like formal expression in his latest writings, where he sketched what he called radical empiricism. The word experience is like a shrapnel shell, and bursts into a thousand meanings. Here we must no longer think of its setting, its discoveries, or its march; to treat it radically we must abstract its immediate objects and reduce it to pure data. It is obvious (and the sequel has already proved) that experience so understood would lose its romantic signification, as a personal adventure or a response to the shocks of fortune. "Experience" would turn into a cosmic dance of absolute entities created and destroyed *in vacuo* according to universal laws, or perhaps by chance. No

minds would gather this experience, and no material agencies would impose it; but the immediate objects present to any one would simply be parts of the universal fireworks, continuous with the rest, and all the parts, even if not present to anybody, would have the same status. Experience would then not at all resemble what Shakespeare reports or what James himself had described in his psychology. If it could be experienced as it flows in its entirety (which is fortunately impracticable), it would be a perpetual mathematical nightmare. Every whirling atom, every changing relation, and every incidental perspective would be a part of it. I am far from wishing to deny for a moment the scientific value of such a cosmic system, if it can be worked out; physics and mathematics seem to me to plunge far deeper than literary psychology into the groundwork of this world; but human experience is the stuff of literary psychology; we cannot reach the stuff of physics and mathematics except by arresting or even hypostatising some elements of appearance, and expanding them on an abstracted and hypothetical plane of their own. Experience, as memory and literature rehearse it, remains nearer to us than that: it is something dreamful, passionate, dramatic, and significative.

Certainly this personal human experience, expressible in literature and in talk, and no cosmic system however profound, was what James knew best and trusted most. Had he seen the developments of his radical empiricism, I cannot help thinking he would have marvelled that such logical mechanisms should have been hatched out of that egg. The principal problems and aspirations that haunted him all his life long would lose their meaning in that cosmic atmosphere. The pragmatic nature of truth, for instance, would never suggest itself in the presence of pure data; but a romantic mind soaked in agnosticism, conscious of its own habits and assuming an environment the exact structure of which can never be observed, may well convince itself that, for experience, truth is nothing but a happy use of signs – which is indeed the truth of literature. But if we once accept *any* system of the universe as literally true, the value of convenient signs to prepare us for such experience as is yet absent cannot be called truth: it is plainly nothing but a necessary inaccuracy. So, too, with the question of the survival of the human individual after death. For radical empiricism a human individual is simply a certain cycle or complex of terms, like any other natural fact; that some echoes of his mind should recur after the regular chimes have ceased, would have nothing paradoxical about it. A mathematical world is a good deal like music, with its repetitions and transpositions, and a little trill, which you might call a person, might well peep up here and there all over a vast composition. Something of that sort may be the truth of spiritualism; but it is not what the spiritualists imagine. Their whole interest lies not in the experiences they have, but in the interpretation they give to them, assigning them to troubled spirits in another world; but both another world and a spirit are notions repugnant to a radical empiricism.

I think it is important to remember, if we are not to misunderstand William James, that his radical empiricism and pragmatism were in his own mind only methods; his doctrine, if he may be said to have had one, was agnosticism. And just because he was an agnostic (feeling instinctively that beliefs and opinions, if they had any objective beyond themselves, could never be sure they had attained it), he seemed in one sense so favourable to credulity. He was not credulous himself, far from it; he was well aware that the trust he put in people or ideas might betray him. For that very reason he was respectful and pitiful to the trustfulness of others. Doubtless they were wrong, but who were we to say so? In his own person he was ready enough to face the mystery of things, and whatever the womb of time might bring forth; but until the curtain was rung down on the last act of the drama (and it might have no last act!) he wished the intellectual cripples and the moral hunchbacks not to be jeered at; perhaps they might turn out to be the heroes of the play. Who could tell what heavenly influences might not pierce to these sensitive half-flayed creatures, which are lost on the thick-skinned, the sane, and the duly goggled? We must not suppose, however, that James meant these contrite and romantic suggestions dogmatically. The agnostic, as well as the physician and neurologist in him, was never quite eclipsed. The hope that some new revelation might come from the lowly and weak could never mean to him what it meant to the early Christians. For him it was only a right conceded to them to experiment with their special faiths; he did not expect such faiths to be discoveries of absolute fact, which everybody else might be constrained to recognise. If any one had made such a claim, and had seemed to have some chance of imposing it universally, James would have been the first to turn against him; not, of course, on the ground that it was *impossible* that such an orthodoxy should be true, but with a profound conviction that it was to be feared and distrusted. No: the degree of authority and honour to be accorded to various human faiths was a moral question, not a theoretical one. All faiths were what they were experienced as being, in their capacity of faiths; these faiths, not their objects, were the hard facts we must respect. We cannot pass, except under the illusion of the moment, to anything firmer or on a deeper level. There was accordingly no sense of security, no joy, in James's apology for personal religion. He did not really believe; he merely believed in the right of believing that you might be right if you believed.

It is this underlying agnosticism that explains an incoherence which we might find in his popular works, where the story and the moral do not seem to hang together. Professedly they are works of psychological observation; but the tendency and suasion in them seems to run to disintegrating the idea of truth, recommending belief without reason, and encouraging superstition. A psychologist who was not an agnostic would have indicated, as far as possible, whether the beliefs and experiences he was describing were instances of delusion or of rare and fine perception, or in what measure they were a

mixture of both. But James – and this is what gives such romantic warmth to these writings of his – disclaims all antecedent or superior knowledge, listens to the testimony of each witness in turn, and only by accident allows us to feel that he is swayed by the eloquence and vehemence of some of them rather than of others. This method is modest, generous, and impartial; but if James intended, as I think he did, to picture the *drama* of human belief, with its risks and triumphs, the method was inadequate. Dramatists never hesitate to assume, and to let the audience perceive, who is good and who bad, who wise and who foolish, in their pieces; otherwise their work would be as impotent dramatically as scientifically. The tragedy and comedy of life lie precisely in the contrast between the illusions or passions of the characters and their true condition and fate, hidden from them at first, but evident to the author and the public. If in our diffidence and scrupulous fairness we refuse to take this judicial attitude, we shall be led to strange conclusions. The navigator, for instance, trusting his "experience" (which here, as in the case of religious people, means his imagination and his art), insists on believing that the earth is spherical; he has sailed round it. That is to say, he has seemed to himself to steer westward and westward, and has seemed to get home again. But how should he know that home is now where it was before, or that his past and present impressions of it come from the same, or from any, material object? How should he know that space is as trim and tri-dimensional as the discredited Euclidians used to say it was? If, on the contrary, my worthy aunt, trusting to her longer and less ambiguous experience of her garden, insists that the earth is flat, and observes that the theory that it is round, which is only a theory, is much less often tested and found useful than her own perception of its flatness, and that moreover that theory is pedantic, intellectualistic, and a product of academies, and a rash dogma to impose on mankind for ever and ever, it might seem that on James's principle we ought to agree with her. But no; on James's real principles we need not agree with her, nor with the navigator either. Radical empiricism, which is radical agnosticism, delivers us from so benighted a choice. For the quarrel becomes unmeaning when we remember that the earth is *both* flat and round, if it is experienced as being both. The substantive fact is not a single object on which both the perception and the theory are expected to converge; the substantive facts are the theory and the perception themselves. And we may note in passing that empiricism, when it ceases to value experience as a means of discovering external things, can give up its ancient prejudice in favour of sense as against imagination, for imagination and thought are immediate experiences as much as sensation is: they are therefore, for absolute empiricism, no less actual ingredients of reality.

In *The Varieties of Religious Experience* we find the same apologetic intention running through a vivid account of what seems for the most part (as James acknowledged) religious disease. Normal religious experience is

hardly described in it. Religious experience, for the great mass of mankind, consists in simple faith in the truth and benefit of their religious traditions. But to James something so conventional and rationalistic seemed hardly experience and hardly religious; he was thinking only of irruptive visions and feelings as interpreted by the mystics who had them. These interpretations he ostensibly presents, with more or less wistful sympathy for what they were worth; but emotionally he wished to champion them. The religions that had sprung up in America spontaneously – communistic, hysterical, spiritistic, or medicinal – were despised by select and superior people. You might inquire into them, as you might go slumming, but they remained suspect and distasteful. This picking up of genteel skirts on the part of his acquaintance prompted William James to roll up his sleeves – not for a knock-out blow, but for a thorough clinical demonstration. He would tenderly vivisect the experiences in question, to show how living they were, though of course he could not guarantee, more than other surgeons do, that the patient would survive the operation. An operation that eventually kills may be technically successful, and the man may die cured; and so a description of religion that showed it to be madness might first show how real and how warm it was, so that if it perished, at least it would perish understood.

I never observed in William James any personal anxiety or enthusiasm for any of these dubious tenets. His conception even of such a thing as free-will, which he always ardently defended, remained vague; he avoided defining even what he conceived to be desirable in such matters. But he wished to protect the weak against the strong, and what he hated beyond everything was the *non possumus* of any constituted authority. Philosophy for him had a Polish constitution; so long as a single vote was cast against the majority, nothing could pass. The suspense of judgment which he had imposed on himself as a duty, became almost a necessity. I think it would have depressed him if he had had to confess that any important question was finally settled. He would still have hoped that something might turn up on the other side, and that just as the scientific hangman was about to despatch the poor convicted prisoner, an unexpected witness would ride up in hot haste, and prove him innocent. Experience seems to most of us to lead to conclusions, but empiricism has sworn never to draw them.

In the discourse on "The Energies of Men," certain physiological marvels are recorded, as if to suggest that the resources of our minds and bodies are infinite, or can be infinitely enlarged by divine grace. Yet James would not, I am sure, have accepted that inference. He would, under pressure, have drawn in his mystical horns under his scientific shell; but he was not naturalist enough to feel instinctively that the wonderful and the natural are all of a piece, and that only our degree of habituation distinguishes them. A nucleus, which we may poetically call the soul, certainly lies within us, by which our bodies and minds are generated and controlled, like an army by a government.

In this nucleus, since nature in a small compass has room for anything, vast quantities of energy may well be stored up, which may be tapped on occasion, or which may serve like an electric spark to let loose energy previously existing in the grosser parts. But the absolute autocracy of this central power, or its success in imposing extraordinary trials on its subjects, is not an obvious good. Perhaps, like a democratic government, the soul is at its best when it merely collects and coordinates the impulses coming from the senses. The inner man is at times a tyrant, parasitical, wasteful, and voluptuous. At other times he is fanatical and mad. When he asks for and obtains violent exertions from the body, the question often is, as with the exploits of conquerors and conjurers, whether the impulse to do such prodigious things was not gratuitous, and the things nugatory. Who would wish to be a mystic? James himself, who by nature was a spirited rather than a spiritual man, had no liking for sanctimonious transcendentalists, visionaries, or ascetics; he hated minds that run thin. But he hastened to correct this manly impulse, lest it should be unjust, and forced himself to overcome his repugnance. This was made easier when the unearthly phenomenon had a healing or saving function in the everyday material world; miracle then re-established its ancient identity with medicine, and both of them were humanised. Even when this union was not attained, James was reconciled to the miracle-workers partly by his great charity, and partly by his hunter's instinct to follow a scent, for he believed discoveries to be imminent. Besides, a philosopher who is a teacher of youth is more concerned to give people a right start than a right conclusion. James fell in with the hortatory tradition of college sages; he turned his psychology, whenever he could do so honestly, to purposes of edification; and his little sermons on habit, on will, on faith, and this on the latent capacities of men, were fine and stirring, and just the sermons to preach to the young Christian soldier. He was much less sceptical in morals than in science. He seems to have felt sure that certain thoughts and hopes – those familiar to a liberal Protestantism – were every man's true friends in life. This assumption would have been hard to defend if he or those he habitually addressed had ever questioned it; yet his whole argument for voluntarily cultivating these beliefs rests on this assumption, that they are beneficent. Since, whether we will or no, we cannot escape the risk of error, and must succumb to some human or pathological bias, at least we might do so gracefully and in the form that would profit us most, by clinging to those prejudices which help us to lead what we all feel is a good life. But what is a good life? Had William James, had the people about him, had modern philosophers anywhere, any notion of that? I cannot think so. They had much experience of personal goodness, and love of it; they had standards of character and right conduct; but as to what might render human existence good, excellent, beautiful, happy, and worth having as a whole, their notions were utterly thin and barbarous. They had forgotten the Greeks, or never known them.

This argument accordingly suffers from the same weakness as the similar argument of Pascal in favour of Catholic orthodoxy. You should force yourself to believe in it, he said, because if you do so and are right you win heaven, while if you are wrong you lose nothing. What would Protestants, Mohammedans, and Hindus say to that? Those alternatives of Pascal's are not the sole nor the true alternatives; such a wager – betting on the improbable because you are offered big odds – is an unworthy parody of the real choice between wisdom and folly. There is no heaven to be won in such a spirit, and if there was, a philosopher would despise it. So William James would have us bet on immortality, or bet on our power to succeed, because if we win the wager we can live to congratulate ourselves on our true instinct, while we lose nothing if we have made a mistake; for unless you have the satisfaction of finding that you have been right, the dignity of having been right is apparently nothing. Or if the argument is rather that these beliefs, whether true or false, make life better in this world, the thing is simply false. To be boosted by an illusion is not to live better than to live in harmony with the truth; it is not nearly so safe, not nearly so sweet, and not nearly so fruitful. These refusals to part with a decayed illusion are really an infection to the mind. Believe, certainly; we cannot help believing; but believe rationally, holding what seems certain for certain, what seems probable for probable, what seems desirable for desirable, and what seems false for false.

In this matter, as usual, James had a true psychological fact and a generous instinct behind his confused moral suggestions. It is a psychological fact that men are influenced in their beliefs by their will and desires; indeed, I think we can go further and say that in its essence belief is an expression of impulse, of readiness to act. It is only peripherally, as our action is gradually adjusted to things, and our impulses to our possible or necessary action, that our ideas begin to hug the facts, and to acquire a true, if still a symbolic, significance. We do not need a will to believe; we only need a will to study the object in which we are inevitably believing. But James was thinking less of belief in what we find than of belief in what we hope for: a belief which is not at all clear and not at all necessary in the life of mortals. Like most Americans, however, only more lyrically, James felt the call of the future and the assurance that it could be made far better, totally other, than the past. The pictures that religion had painted of heaven or the millennium were not what he prized, although his Swedenborgian connection might have made him tender to them, as perhaps it did to familiar spirits. It was the moral succour offered by religion, its open spaces, the possibility of miracles *in extremis*, that must be retained. If we recoiled at the thought of being dupes (which is perhaps what nature intended us to be), were we less likely to be dupes in disbelieving these sustaining truths than in believing them? Faith was needed to bring about the reform of faith itself, as well as all other reforms.

In some cases faith in success could nerve us to bring success about, and so justify itself by its own operation. This is a thought typical of James at his worst – a worst in which there is always a good side. Here again psychological observation is used with the best intentions to hearten oneself and other people; but the fact observed is not at all understood, and a moral twist is given to it which (besides being morally questionable) almost amounts to falsifying the fact itself. Why does belief that you can jump a ditch help you to jump it? Because it is a symptom of the fact that you *could* jump it, that your legs were fit and that the ditch was two yards wide and not twenty. A rapid and just appreciation of these facts has given you your confidence, or at least has made it reasonable, manly, and prophetic; otherwise you would have been a fool and got a ducking for it. Assurance is contemptible and fatal unless it is self-knowledge. If you had been rattled you might have failed, because that would have been a symptom of the fact that you were out of gear; you would have been afraid because you trembled, as James at his best proclaimed. You would never have quailed if your system had been reacting smoothly to its opportunities, any more than you would totter and see double if you were not intoxicated. Fear is a sensation of actual nervousness and disarray, and confidence a sensation of actual readiness; they are not disembodied feelings, existing for no reason, the devil Funk and the angel Courage, one or the other of whom may come down arbitrarily into your body, and revolutionise it. That is childish mythology, which survives innocently enough as a figure of speech, until a philosopher is found to take that figure of speech seriously. Nor is the moral suggestion here less unsound. What is good is not the presumption of power, but the possession of it: a clear head, aware of its resources, not a fuddled optimism, calling up spirits from the vasty deep. Courage is not a virtue, said Socrates, unless it is also wisdom. Could anything be truer both of courage in doing and of courage in believing? But it takes tenacity, it takes *reasonable* courage, to stick to scientific insights such as this of Socrates or that of James about the emotions; it is easier to lapse into the traditional manner, to search natural philosophy for miracles and moral lessons, and in morals proper, in the reasoned expression of preference, to splash about without a philosophy.

William James shared the passions of liberalism. He belonged to the left, which, as they say in Spain, is the side of the heart, as the right is that of the liver; at any rate there was much blood and no gall in his philosophy. He was one of those elder Americans still disquieted by the ghost of tyranny, social and ecclesiastical. Even the beauties of the past troubled him; he had a puritan feeling that they were tainted. They had been cruel and frivolous, and must have suppressed far better things. But what, we may ask, might these better things be? It may do for a revolutionary politician to say: "I may not know what I want – except office – but I know what I don't want"; it will never do for a philosopher. Aversions and fears imply principles of preference,

goods acknowledged; and it is the philosopher's business to make these goods explicit. Liberty is not an art, liberty must be used to bring some natural art to fruition. Shall it be simply eating and drinking and wondering what will happen next? If there is some deep and settled need in the heart of man, to give direction to his efforts, what else should a philosopher do but discover and announce what that need is?

There is a sense in which James was not a philosopher at all. He once said to me: "What a curse philosophy would be if we couldn't forget all about it!" In other words, philosophy was not to him what it has been to so many, a consolation and sanctuary in a life which would have been unsatisfying without it. It would be incongruous, therefore, to expect of him that he should build a philosophy like an edifice to go and live in for good. Philosophy to him was rather like a maze in which he happened to find himself wandering, and what he was looking for was the way out. In the presence of theories of any sort he was attentive, puzzled, suspicious, with a certain inner prompting to disregard them. He lived all his life among them, as a child lives among grown-up people; what a relief to turn from those stolid giants, with their prohibitions and exactions and tiresome talk, to another real child or a nice animal! Of course grown-up people are useful, and so James considered that theories might be; but in themselves, to live with, they were rather in the way, and at bottom our natural enemies. It was well to challenge one or another of them when you got a chance; perhaps that challenge might break some spell, transform the strange landscape, and simplify life. A theory while you were creating or using it was like a story you were telling yourself or a game you were playing; it was a warm, self-justifying thing then; but when the glow of creation or expectation was over, a theory was a phantom, like a ghost, or like the minds of other people. To all other people, even to ghosts, William James was the soul of courtesy; and he was civil to most theories as well, as to more or less interesting strangers that invaded him. Nobody ever recognised more heartily the chance that others had of being right, and the right they had to be different. Yet when it came to understanding what they meant, whether they were theories or persons, his intuition outran his patience; he made some brilliant impressionistic sketch in his fancy and called it by their name. This sketch was as often flattered as distorted, and he was at times the dupe of his desire to be appreciative and give the devil his due; he was too impulsive for exact sympathy; too subjective, too romantic, to be just. Love is very penetrating, but it penetrates to possibilities rather than to facts. The logic of opinions, as well as the exact opinions themselves, were not things James saw easily, or traced with pleasure. He liked to take things one by one, rather than to put two and two together. He was a mystic, a mystic in love with life. He was comparable to Rousseau and to Walt Whitman; he expressed a generous and tender sensibility, rebelling against sophistication, and preferring daily sights and sounds, and a vague but

indomitable faith in fortune, to any settled intellectual tradition calling itself science or philosophy.

A prophet is not without honour save in his own country; and until the return wave of James's reputation reached America from Europe, his pupils and friends were hardly aware that he was such a distinguished man. Everybody liked him, and delighted in him for his generous, gullible nature and brilliant sallies. He was a sort of Irishman among the Brahmins, and seemed hardly imposing enough for a great man. They laughed at his erratic views and his undisguised limitations. Of course a conscientious professor ought to know everything he professes to know, but then, they thought, a dignified professor ought to seem to know everything. The precise theologians and panoplied idealists, who exist even in America, shook their heads. What sound philosophy, said they to themselves, could be expected from an irresponsible doctor, who was not even a college graduate, a crude empiricist, and vivisector of frogs? On the other hand, the solid men of business were not entirely reassured concerning a teacher of youth who seemed to have no system in particular – the ignorant rather demand that the learned should have a system in store, to be applied at a pinch; and they could not quite swallow a private gentleman who dabbled in hypnotism, frequented mediums, didn't talk like a book, and didn't write like a book, except like one of his own. Even his pupils, attached as they invariably were to his person, felt some doubts about the profundity of one who was so very natural, and who after some interruption during a lecture – and he said life was a series of interruptions – would slap his forehead and ask the man in the front row "What *was* I talking about?" Perhaps in the first years of his teaching he felt a little in the professor's chair as a military man might feel when obliged to read the prayers at a funeral. He probably conceived what he said more deeply than a more scholastic mind might have conceived it; yet he would have been more comfortable if some one else had said it for him. He liked to open the window, and look out for a moment. I think he was glad when the bell rang, and he could be himself again until the next day. But in the midst of this routine of the class-room the spirit would sometimes come upon him, and, leaning his head on his hand, he would let fall golden words, picturesque, fresh from the heart, full of the knowledge of good and evil. Incidentally there would crop up some humorous characterisation, some candid confession of doubt or of instinctive preference, some pungent scrap of learning; radicalisms plunging sometimes into the sub-soil of all human philosophies; and, on occasion, thoughts of simple wisdom and wistful piety, the most unfeigned and manly that anybody ever had.

AMERICA AND THE LIFE OF REASON

Horace M. Kallen. "America and the Life of Reason. II." *Journal of Philosophy* 18.21 (13 October 1921): 568–575.

V

The discussion of James and Royce by the last survivor of the great school brings together in a fashion vivid and touching and beautiful the diversified spirit of its oneness, the uncompromised singularity of each member of that high fellowship. There is neither need nor service here to expound and review the differences between Mr. Santayana and his colleagues, and to resume his criticisms, profound or wise or mischievous or uncomprehending, of idealism and pragmatism, or his harder, less urbane, somewhat contemptuous judgment of the new realism. These have been often stated and are well known, but the perfection of their form adds an esthetic, not a logical, value to their content. Nor is anything added to the method. Mr. Santayana still restates the alien doctrine in the light, not of its own premise and the signification of its own terms, but of his own view as critic. He still makes the same assumption that such a shift of the premises does not put the argument beside the point, that it does not, like the "higher superstition," convert inquiry into an exercise in assurance, that it is not in its own turn the arguing of a foregone conclusion. Take as an instance, the discussion of James's ideas regarding the will to believe: "In some cases," Mr. Santayana interprets, "faith in success could nerve us to bring success about, and so justify itself by its own operation. This is thought typical of James at his worst – a worst in which there is always a good side. Here again psychological observation is used with the best intentions to hearten oneself and other people; but the fact observed is not at all understood, and a moral twirl is given to it which (besides being morally questionable) almost amounts to falsifying the fact itself. Why does the belief that you can jump a ditch help you to jump it? Because it is symptom of the fact that you *could* jump it, that your legs were fit and that the ditch was two yards wide and not twenty. A rapid and just appreciation of these facts has given you your confidence, or at least has made it reasonable, manly and prophetic; otherwise you would have been a fool and got a ducking for it. Assurance is contemptible and fatal unless it is self-knowledge. If you had been rattled you might have failed, because that would have been a symptom of the fact that you were out of gear; you would have been afraid because you trembled, as James at his best proclaimed.

You would never have quailed if your system had been reacting smoothly to its opportunities, any more than you would titter and see double if you were not intoxicated.... Nor is the moral suggestion here less unsound. What is good is not the presumption of power but the possession of it: a clear head, aware of its resources, not a fuddled optimism, calling up spirits from the vasty deep. Courage is not a virtue, said Socrates, unless it is also wisdom. Could anything be truer both of courage in doing and of courage in believing? But it takes tenacity, it takes *reasonable* courage, to stick to scientific insights such as this of Socrates or that of James about the emotions; it is easier to lapse into the traditional manner, to search natural philosophy for miracles and moral lessons, and in morals prefer, in the reasoned expression of preference, to splash about without a philosophy."

Those who recall the passage in "The Sentiment of Rationality" on which these sentences are commentary will perceive at once how it is parodied, and – the observation is unavoidable – degraded. An unwonted and momentous situation is made over into a common place one; an issue of life and death into one of walking or getting a ducking; an abyss is converted into a ditch, a terrible leap into an ordinary jump. The propulsive emotional crisis, the absence or impossibility of any basis competent for inference are converted into their opposites. The *process* of the self-confirmation of the act of faith that creates its own verification is displaced by the prior guarantee in observation of this verification. Prospect and change are declared to be really retrospect and fixity; you *have* jumped the ditch because you *could*. The whole premise of the argument has been shifted and the contrary conclusion drawn from the contrary premise. The risk, on which courage is postulated, the conception of faith as the willingness, in James's words, "to act in a cause the prosperous issue of which is *not* certified to us in advance," or as the "courage weighted with responsibility – such courage as the Nelsons and Washingtons never failed to show after they had taken everything into account that might tell against their success and made every provision to minimize disaster," these are ruled out. After much brave protestation, the game is made a game with loaded dice after all, made just what in James's hypothesis it absolutely was not. In effect, the argument does not refute, it contradicts. Mr. Santayana's philosophy runs parallel with those of his colleagues but does not meet them. The same heaven arches over them, whose shifting iridescence they alike give back; they are fed by the same springs and they water the same lands and are by them muddied, and that is all. They touch sometimes, but mingle never, and perhaps never could.

It is this mingling of the same earth and sky in their separate streams that renders them alike American. Neither could Santayana escape the bondage of the "two different responsibilities," that of "describing things as they are, and that of finding them propitious to certain preconceived human desires." For the life of reason is no less such a desire, and for all its obscuration no

less pervasive, and for all its urbanity no less capable of becoming a dogma and generating a religion than the "higher superstition." The adventure after the "good life" was undertaken by all three alike, under a similar impulsion and in a similar atmosphere. That what each found should have been different is not without its implication of the nature of things, or of the condition of the intellectual life in the United States. And that one kind of life only should be called a good life, and that of a fashion arising not from the soil of present life, but from a memory and estimate of life long gone, that perhaps is most romantic and American of all.

Of the relations of James and James's thought to this America, Mr. Santayana says very little. He remarks how essentially different and other James appeared to the academic and social community in which he dwelt, how he was a liberal – "one of those elder Americans still disquieted by the ghost of tyranny, social and ecclesiastical," but nothing more. He ignores his militant love of peace, so essentially American, his reformist spirit, so characteristic of New England. His preoccupation is entirely with James's temperament and philosophy. These he sums up as "a romantic mind soaked in agnosticism, conscious of its own habits and assuming an environment the exact structure of which can never be observed"; the conception of radical empiricism and pragmatism as methods, the analysis of belief, the notion of pure experience, the analysis of truth, and the other spokes in the wheel of James's thought are really treated as radiations from this central hub. Consequently, James's greatness accrues to him as a psychologist, not as a philosopher. Philosophy was to him, in Mr. Santayana's estimation, not a "consolation and a sanctuary in life which would have been unsatisfying without it," but "a maze in which he found himself wandering," and he was trying to find his way out of the maze. But this philosophy, Mr. Santayana fails to recognize, was the verbiage of the schools; it was not the way out or the brave seeing of the contradiction in things and in oneself which he as bravely celebrated in his description of the Harvard school.

Yet, to the American aspect of this contradiction in things and men James was a philosopher most sensitive. In his training and contacts he was essentially more cosmopolitan than either of his colleagues; his philosophy was nevertheless an insight into the eternal springs of this contradiction, flowing so much more freely, into channels so much less artificial in America than in Europe. He had a greater natural kinship with America's spontaneous life and he envisaged in a pertinent metaphysical premise the whole unbalanced and shifting structure of the changing American economy; the atomism and fluidity of American society; the democratic dogma; and, most famously and influentially, the tenacious experimentalism, the swift courage, the stark faith of men to put life and property and opinion to the proof of adventure into the unknown wilderness toward whatever "good life" nature suggested or calculation advised.

In Royce's thinking the same influences are present, but not freely. Between them and his vision there is interposed the veil of the genteel tradition, and its unity and texture imparts to them a false solidity. He is not, like James, looking at the tradition as well as the thing, and evaluating the tradition also. He is looking at the thing, certainly, persistently, and looking at it *though* the tradition. Hence a certain liturgical unction and obscurity which pervades Royce's thought. He viewed everything, Mr. Santayana says, in relation to something else, and this something contained invariably an element sad and troublesome, out of which the thing under view, if good, arises by a sort of Hegelian implication. His proof of the existence of God is his demonstration of the reality of error; his assurance of the reality of the good was his experience of the power of evil. He argued, in effect, in his own special way the foregone conclusions of the "higher superstition." His philosophy was all compensatory. By translating Calvinism into epistemological terms, by imparting to the dialectic method of Hegel the earnestness, eloquence and voluble passion of his own temperament and scene, he gave the genteel tradition a new pattern and an added content, This was not logical. He had, it is true, a reputation for logic and loved the intricacies of logistics; he could, on occasion, eye to eye with Spinoza, see things under the aspect of eternity. But "there was no clearness in his heart." In him the intellect, which Mr. Santayana regards as the "faculty of seeing things as they are," was dimmed and distorted by the passion for seeing things as we want them to be. Nevertheless, the hardness of the nature of things, its pang and poison, troubled Royce. He had a reverence for what hurts: "in so far as God was the devil ... devil worship was true religion." Life and the good of life are the struggle between good and evil, and the struggle can not be unless evil exists the peer of good. The proof of this was evident in daily routine as well as Hegelian logic. Royce "had always experienced and seen about him a groping, burdened, mediocre life; he had observed how fortune is continually lying in ambush for us, in order to bring good out of evil and evil out of good. In his age and country all was change, preparation, hurry, material achievement; nothing was an old and sufficient possession.... The whole scene was filled with acts and virtues which were merely useful or remedial. The most pressing arts, like war and forced labour, presuppose evil, work immense havoc, and take the place of greater possible goods. The most indispensable virtues, like courage and industry, do likewise. But these seemed in Royce's world the only honorable things." Thus the grappling with nature of which so much of American life consists was converted into a standard of life, and given such grace and distinction as clothing it in the decent garment of the genteel tradition might impart. In this lay Royce's personal conscience, and it carried him beyond his Hegelian ethics, as his protest against the sinking of the Lusitania showed. By training and technique a Hegelian, by implication a solipsist, this conscience of his, which "added a deep, almost remorseful

unrest to his hard life," carried him beyond Hegelism, making his God real, and begging the gratuity of another life in the immortal society of his friends. All in all, Royce "resembled some great-hearted mediaeval peasant visited by mystical promptings, whom the monks should have adopted and allowed to browze among their theological folios.... His was a gothic and scholastic spirit, intent on honoring God in systematic works, like the coral insect or the spider; eventually creating a fabric that in its homely intricacy and fulness arrested and moved the heart, the web of it was so vast, and so full of mystery and yearning."

It may be inferred from Mr. Santayana's treatment of both James and Royce that the fulness of the new world influence was not manifest in them. To him their insight was a mingling of tradition and actualities, with tradition more than a little dominant. In the later contemporary movements of philosophy in America the relationships are, however, reversed. Tradition is either passing or forgotten. He sees the younger professors of philosophy as more like engineers or doctors or social reformers than clergymen or schoolmasters. Religion has ceased to signify anything momentous for them. They are no longer so eloquent and apostolic as professors of philosophy used to be; instead, "very professional in tone and conscious of the *Fach*," a special craft in the academic industry. The younger American professor of philosophy is a person with an education "more pretentious than thorough; his style is deplorable; social pressure and his own great eagerness have condemned him to overwork, committee meetings, early marriage, premature authorship and lecturing two or three times a week under forced draught. He has no peace in himself, no window open to a calm horizon, and in his heart perhaps little taste for mere scholarship or pure speculation. Yet, like the plain soldier staggering under his clumsy equipment, he is cheerful; he keeps his faith in himself and his allotted work, puts up with being toasted only on one side, remains open-minded, whole hearted, appreciative, helpful, confident of the future of goodness and of science. In a word, he is a cell in that teeming democratic body; he draws from its warm, contagious activities the sanctions of his own life, and less consciously the spirit of his philosophy."

The marching front of this spirit is to be found in pragmatism and new realism. The former is a confusion of mind which converts truth, the vision of all things under the form of eternity, ever beyond the reach of psychology, into the psychological doctrine of the relation of signs to things signified, interpreting this relation in terms of contiguity and succession. The latter is a standing on its head of the traditional German idealism. This replaced things by consciousness; the new realism replaces consciousness by things. It relieves "an overtaxed and self-infected generation" by "abolishing a prerequisite to the obvious, and leaving the obvious to stand alone." It democratizes reality by reducing everything to the same status and making it equally accessible to everybody. "The young American is thus reassured: his joy in living and

learning is no longer chilled by the contempt which idealism used to cast on nature for being imaginary and on science for being intellectual." Both the contemporary schools thus reflect the atmosphere of America, and in two ways. First, in that "it has accelerated and rendered fearless the disintegration of conventional categories.... In the second place, the younger cosmopolitan America has favoured the impartial assemblage and mutual confrontation of all sorts of ideas. It has produced, in intellectual matters, a sort of happy watchfulness and insecurity." And this is how migration to the new world has affected philosophical ideas.

Which may be so. But I doubt whether even those pragmatists and new realists who have been curious about just such matters and have reflected on them will recognize the features of their ancestry or themselves in the portrait. "The disintegration of conventional categories," they will concede, but the new realists will insist, I think, that so far as they are concerned it is a conventional and not an American disintegration, and that the forces which operate it in America do not differ in kind, intensity or range from those in Europe. The pragmatists will concede the total implication of the description, but will declare that Mr. Santayana has altogether failed to grasp its character and import. This failure is perhaps at base emotional rather than intellectual. Mr. Santayana has always manifested a certain blindness to the ideas of change and time and flux in their intrinsicality and inwardness, and a certain imperviousness to the meaning of the categories and concepts which have grown out of them, and the new philosophic technique which they have generated. Preoccupied with the eternal, the static, the immutable, as Plato and Aristotle and Spinoza have formulated these in ethics and physics and psychology, he has invariably translated the studies of the temporalists into the language of the eternalists, substituting these incommensurables for one another, with beautiful but not cogent results. With the new realists, on the other hand, he is more at home. He and they have the same devotion and speak the same language. They also are eternalists, preoccupied with the unchanging structure of things. They are, however, so preoccupied, not because they recognize change and acquiesce in insecurity, but because they deny change and, fearing, resent insecurity. That they have "abolished the prerequisite to the obvious" is a sign of this denial and resentment. This abolition is not a simplification which frees the new realist's "joy in living and learning ... from the contempt which idealism used to cast on nature for being imaginary and on science for being didactic." On the contrary, there appears to be no joy in the neo-realist. He is as Calvinistic as his forebears. Only the incidence of the cosmic compulsion has been shifted for him. It resides no longer in the immutable decrees of a transcendental God, but in the immutable architectonic of a nature whose laws operate by logistical implication and whose providence is didactic without being altogether personal. Thus, together with the denial of a prerequisite to the obvious goes the establishment and cultivation of security,

the relaxation of watchfulness. It is an attenuation of the "higher superstition" but it is the higher superstition still. It is the modern scholasticism, the scholasticism of science converted from a method of inquiry into a process of affirmation, from the logic of experiment to the logic of assertion. Its social inspiration is to be sought in financial industrialism, with the regimentation, precision, inevitability of the automatic machine in shop and factory, and in the similar qualities more refined in the mathematics of accounting in bank and office. It is unrelated to the sentiment, experience and aspiration of the migration to the new world. That has still not reached expression in philosophy. It is as yet vocal in poetry alone.

VI

So much, then, for Mr. Santayana's resolution of the puzzle of America. It is complementary rather than parallel to those of his predecessors and fellows in the field, dealing with an inward aspect of American character and opinion too withdrawn and elusive for any but a familiar friend to touch without distorting or to interpret without misunderstanding. It has the same narrowness and oversimplification as these others, but if it is blind to what they have seen, it is keenly sensitive to what they are blind to. Mr. Santayana is himself perhaps too deeply absorbed by the ardors and glories of the topmost turn given to life to have much sympathy for its soil or roots or branches. His study has failed to take note of the political character of the American being, of the overwhelming influence of the rigid identities of political pattern of state, nation and. City, or the power of the public school as the transmitter of the national tradition and the perpetuator of the democratic dogma, or the relation of these to the stratifying influence of the automatic machine, or the interaction of these with the diversities of soil and climate, race and culture which are constitutive of the land, and the additional diversities which are added by "the miscellany of Europe." These seem to me at the present time to have been adjusted to one another as a tensive and unstable equilibrium of forces rather than a cooperation of spirits; the various movements in art or philosophy appear more truly as negations of them or compensations for them than as their expression. What the America of the new time will be depends altogether on how soon and how completely the unstable equilibrium of forces is converted into the cooperation of spirits, and the negations and compensations become affirmations and expressions.

WILLIAM JAMES AND HIS IMPETUOUS PHILOSOPHY

Jacques Maritain. "William James and His Impetuous Philosophy." *Living Age* 311.4036 (12 November 1921): 392–396.

Within the last half-century, a philosophic movement of striking interest has been developing in the Anglo-Saxon countries, perhaps more definitely in America than in England. It has not contributed much, up to the present time, toward *raising* the level of speculative philosophy, because it is, unfortunately, deprived of all lofty creative traditions. It has built chiefly upon the foundations of Hegel, Lotze, Mill, and Renouvier – pretty poor masters themselves; and its claims to ingenuousness, to intuitive insight, to fresh unsophistication, and to a gay disregard of established precedent, too often betray, especially in the country of Walt Whitman, a rusticity in comparison with which those sensualist philosophers whom Plato imagined embracing the trunks of trees seem like the representatives of the most elaborate culture.

William James, toward whom our thoughts turn chiefly in this connection, is almost the only American philosopher who is at all well known to our own reading public. For all that, his European fame is out of proportion to the true value of his thought; at least, I believe that there is far more promise in the more honest and profound researches of other new-world philosophers, the so-called 'neo-realists'. They have, at least, the merit of having freed themselves from the absurd assumption that all philosophic values can be transformed by the magic of pragmatism; and they have the far greater merit of having detected and denounced the common fallacy that vitiates the most contradictory of modern doctrines: idealism and subjectivism. Perry and Spaulding, in subjecting the idea of relativity to a close analysis, and in restoring the true and insoluble mystery of perception, and Marvin, in reviving the great Aristotelian theory of the impossibility of absorbing into the universal and arbitrary laws of science the contingency of individual events, have put their fingers on several of the vital springs of rational thought. It is very desirable that the discussion between these men and the academicians, touched upon in a book by M. Kremer, should be actively followed up.

M. Jean Wahl, in a more purely descriptive and historical vein, treats the subject of Anglo-Saxon pluralism. His complete and well-documented work opens the most interesting vistas, which may well engage our attention. He

confirms only too strongly the distressing fact that modern philosophy tends to be more and more subordinated to national and geographical divisions. It is certainly curious that, in a time when mechanical and technical progress provides undreamed-of facilities for communication between various countries, philosophy should become very much less universal, much less broadly human, and much more assertive of national peculiarities than it was in the Middle Ages.

Hegel tried to prove that there was a great foreordained harmony between metaphysics and the Prussian State. Is it necessary that philosophy, in order to escape from the 'absolutism' of the Hegelian doctrine, should accept the Anglo-Saxon law of utilitarian and moon-struck impetuosity? "In the eyes of most pluralists," writes M. Wahl, "their doctrine is a national philosophy. James states that he would like to return to the great *English* classic tradition of investigating and challenging all concepts. Pragmatism, according to him, is an English mode of thought."

Where are the happy civilizations of ancient Greece and old-time France, where, in the most national of soils, the most universal and the most broadly human philosophy took root?
